NEW ENGLAND FARME

Published by JOHN B. RUSSELL, at the corner of Congress and Lindall Streets, Poston. -THOMAS G. CESSENDEN, EDITOR

VOL. IV.

BOSTON, FRIDAY. APRIL 28, 1826.

ORIGINAL COMMUNICATIONS.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

CULTIVATION OF POTATOES.

Worcester County, 4th Mo. 10, 1826. There have been grievous complaints by the people of Boston for a number of years (and not without just cause) of had potatoes. I have noticed a number of scientific disquisitions upon the subject, but none that exactly accords with my views. However incorrect I may be in my conclusions upon the subject, I may run but little risk in stating what I think I have satisfactorily ascertained to be the best method for me. on my land, for insuring good potatoes. About fifteen years since, I purchased some of the common blue potatoes for seed. The seller said the potatoes had heretofore been very good, but he thought they had lost their good quality, and that by changing them (as the phrase is) they would do better. I was young and inexperienced, but I had no faith in this hypothesis. However, the potatoes were ill shaped things, and, when cooked, as free from any farinaceons appearance as a pickled cucumber. I planted them on a piece of land that I was subdoing dunged them lightly with winter duog which was spread and harrowed in. The crop was middling, and the potatoes for autumn and wither eating, tolerably good. The next season I manured the same land with winter dung, and ploughed it in; round, fair and middling sized potatoes only were selected from the previous year's growth, for seed; they were planted in the usual way, two in a hill; ploughed and lioed twice. The succeeding antumn they yield ed a good crop of mostly round, fair and handsome potatoes, and for eating I never saw better. Their superior quality was noticed by all who are of them. I now considered that these

seed only; but it was an erroneous conclusion. The third year the seed was selected as before; a part of the same field, ploughed and manured in the same way as the year before, was planted; some of the selected seed was also planted in a field that had for a number of years been cultivated-here, several rows were dunged in the hill with fine mixed manute, and about as many with only a handful of plaster.-In the fall I commenced digging successively of the . wee different plantings for table use; those dunged in the hill, appearing nearest maturity. I began upon them first; I found their appearance different from those raised the year before, more long ones-some part eaten by worms, and others with small ones attached to them by narrow necks. They were cooked, but instead of being sound mealy potatoes, they were of but an ordinary quality—some had hard balls in the middle, and others hollow. I next dug some of those that were plastered, their appearance was better, less small ones, no effects of worms, but less in a hill-when cooked they were somewhat better than the others, but very inferior to the 2d year's crop. Here my scheme for the

potatoes had regained their prigioal good qual-

ity; and that it was affected by selecting the

improvement of run-out potatoes, was for a mo-ment frustrated; however, the next trial was ed with the end sealed with the composition upon those in the new field; here the hills af-used on trees after pruning. I was quite forded a good yield of round, fair and clear pe-pleased with the new idea of obtaining a choice tatoes; when boiled, they were about as good collection of fruit trees so easily. Accordingly as the 2d year's growth, but nothing improved. I went to work and selected the finest thrifty I continued experiments, (always careful in the scious I could procure, from various stocks, and selection of the seed) and the 4th year plough-ed and fenced with posts and rails, a piece of 40 feet in length, from four to six inches awart. green sward in my pasture harrowed in coarse and took the greatest pains with them. The dung, and had an excellent crop of the best of greater part of them leaved out, and remained potatoes, (some of these I sold in Boston for 50 just in that situation most of the season, without cents, when they were plenty in the market for advancing. The next season very few produc-50 and 33 cents.) I also planted around a corn- ed any signs of vegetation, and by autumn they field two rows; this field had been ploughed 4 were all dead with the exception of now and years in succession-winter dung ploughed in then one having a slight appearance of life near and fine mixed manure put to the hills; these the lower put, just above the surface of the potatoes yielded as well and perhaps some more than those in the pasture, but they were more ined had not the least semblance of a root. deformed and less farinaceous, and in the following spring there was a great difference in tent, cannot be cultivated in this way. There the potatoes. I now believed that to raise good potatoes and to preserve, undiminished, the quality of the kind, that something more was cass, and I should recommend to those who wish necessary to be observed, than the selection of to make the experiment to do it in a limited the seed. Therefore, for myself, I adopted the manner, as it will be labor in vain. following method, from conclusions drawn from the foregoing experiments, and from general observation and inquiry upon the subject. First, to select such potatoes, shape and size, as I wish 10 raise. Secondly, to plant them on new or green sward land, two, and not to exceed three ears in succession. Thirdly, to use no other hip winter dung (except the addition of plaster to the bills or vines) for manure dressing, to spread this and mingle it with the soil; this as follows. being generally free of worms, and its decompo- cider is out, and drain off the lees (if the cask sition will be about the time the roots of the never to plant them on a wet or clayey soil .-By observing these particulars I have always had good potatoes; my blues I still keep, and I don't know that I can find better, notwithstanding some thought them run out more than fifteen years ago. Whoever is disposed to adopt the above method and perform it, will no more be troubled with the disagreeable tang of rank and watery potatoes-and for what they have to spare, the citizens of Boston, I presume, will willingly pay them a good price. I am of the opinion that good potatoes for table use, are seldom produced from fields that have been long and highly cultivated. Perhaps some of the agriculturalists near Boston may be induced to try the experiment, if it has not been particu larly tried. I continue to plough small pieces up, and find my pasture benefitted by it. I will existence of our orchards. add no more to the subject this time, but submit the foregoing to the better judgement of expe-D. S. rienced and practical farmers.

CIDER BARRELS.

. Wilesex County, April 18, 1826.

A cheap war to keep order barrels sweet is Take the barrels soon after the has been kept full while the cider was working potatoes need its nourishment. And fourthly, there will be but a trifle;) bung them tight, and put them in some suitable place. Previous to using them for cider the ensuing season, rinse them. I have practised the above method for more than twenty years, and never had any cask which did not keep periectly sweet. Rinsing casks with cold water, and not keeping them bunged tight, I believe is the principal cause of so many cider casks' becoming foul and musty.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

THE BORER.

Weston, April 19, 1826.

Sir-I have read several communications made lately in your useful paper on the subject of the borer. Having been a sufferer by its destructive work, I think it a duty to offer you the in my pasture, when I have no green swald of result of my observations on the ways of that a number of years' standing that I wish to turn ravager, who, in my opinion, threatens the very

By referring to Buffon I find that there are nine species of the borer (capricorne Carambix). The insect after his last transformation is a beetle of a dark slate or brown colour, some of the smaller species have figured stripes on their wings; they fly about in the heat of July, quick on the wing, and shy. They are little noticed, and deposit, then, their seed in the bark of al-Sin-Some three or four years since I read a most every kind of trees; the oak bark is filled

which depend the whole tribe of the woodpeckers. Go into the forest and you hear these birds "bushel of lime rubbish of old buildings, that pecking the trees in quest of their food; go " from ceilings of rooms is preferable, or lime and look at the logs of timber, which may have "which has been slacked at least six months, laid in your yard for one year, and you will find " half of a bushel of wood ashes, and two quarts the decayed bark well stocked with borers. If " of fine pit or river sand. The three last artiyou lay by your fire wood, to burn it dry, go into | " cles are to be sifted fine before they are mixhear the borers at work. Please to notice the "and soap suds with a spade and afterwards timbers of your buildings, and wherever a slip "with a wooden beater until the stuff is very of bark has been suffered to remain, there again " smooth like fine plaster, used for the ceilings you will trace the destroyer. In fact, nature 4 of rooms. Then mix again soap suds and seems to be so full of them that it is a matter of "urine, to bring it to the consistence of thick astonishment that our apple trees are not in a "paint, and lay it on the trees with a painter's situation still more deplorable. The locust " or white washing brush. It will not only they have so nearly exterminated that hardly a keep the trees free from borers, but it will heal trace of them remains; and as the wood lands sore wounds and cankers, and transform into are fast clearing away, and the pasturing healthy and fruitful trees, some which at first ground of the borer is thereby reduced, we sight seemed to defy the hope of recovery. may expect that their famishing tribes will You will please however to recollect that hapwreak their vengeance more and more upon our py results in any pursuit, but more especially in the month of May, at the time when the orchards; in such a threatening case, what are in agriculture, are not to be obtained but by we to do? the beetle flies about so wild, that care and perseverance. Whilst on the subject ly tender; the leaves must be always gatherthe destroying of them appears to be impossi of borers I beg leave to mention further, that ed in the evening for the next day morning, lest ble. But by painting the trees with some come in families who use stoves, which require dry they should not be moist. The quantity of position, and keeping them so painted through wood, the only method to prevent their oak and leaves that one has should always be calculated the season, I have no doubt that much good can yellow pine being injured by the borers, is to be dooe; the female beetle is provided at the stow it in a close wood house, from which the lower part of her body with something like a light is excluded. I had some last season, in an small hollow lancet; where the bark is tender open shed, which was so much injured that cient for 1000 worms. A tree six years old she pricks it with that little instrument and at the bark fell off from most of it. I had some in the same instant lets a small seed slip through a place shut up, where no light is admitted, and it, and be lodged in the bark. Where the it was perfectly sound. From this we may contrees are old, and the bark scaly and hard she clude that the seed deposited in the bark by the deposits the seed under the scales; these seeds beetle, requires the light and free air to develcome to life the spring after, and the small bor- ope itself into life; and that wherever the light to enter the apartment; that is to say, care er gnaws its way immediately into the bark .--I conceive that the large borers which attack think that these notes can be useful, please to penctrating the room. The worms are subject the butts are the offspring of the large beetle, give them insertion, and to accept of the good to many diseases. When they are discovered and that the smaller species are those which we find to infest the branches, and the existence of which is indicated by black spots on the bark, which being removed with the knife, bring to light, in general, a number of little worms. A coat of composition laid over the bark becomes an effectual shield against the destructive little lancet, whose power is blunted by the harshness of the paint. It is needful to remove carefully the grass from round the butts that there should be no space whatever left unpainted and that the soil should to that effect, lap over the paints; the main branches should be painted as well as the butts. The first painting should be and the sap flows freely. As the rains wash it away it ought to be renewed, so as never to leave the bark uncovered and exposed. Three the season. Various are the compositions used; they not only protect the trees against the borers, but have a tendency to feed the trees by absorption, and to get the bark inte that bright and lively order which insures prosperity. Various are the compositions used and to none of of broadcloth manufactured at the Saxon factoused alone and quick. Its power as a stimulant is so great that I am convinced of the unfitness to use it, unless a gentleman wishes to bring his young trees to a premature state of bearing, of old age, and of decay. The composition of Forsyth, from long experience can be recommend. them the preference to English cloths of the beg when you write to remember that at a dised as productive of the most beneficial effects; same cost. Every American who feels an inter-stance minute particulars are very welcome.

stocked; and the borers are the meat upon may save the trouble to refer to his publication.

POTATOES.

Ryegate, Vt. April 21, 1826.

On the third of May 1825 I selected twenty good handsome potatoes, as hear of a size as possible, ten of which I planted whole in ten hills,-the other ten I cut into four pieces each, and planted in ten hills, in a parallel row with dollars per pound. the other, four pieces in each hill. On the 28th day of September I dug the potatoes and weighed the produce of each row by itself. The row performed as soon as the weather gets warm, in which the 10 whole potatoes were planted weighed 46 pounds 12 ounces-and the row that was cut into quarters, produced 77 pounds 4 oz. The rows were contiguous to each other, and or four times will carry the trees safe through the soil exactly the same. No manure was used. J. W.

. DOMESTIC MANUFACTURES.

maple. The forest and the orchard are fully although well known, by transcribing it here, it est in the prosperity of his country should give the preference to domestic fabrics, the price and quality being equal .- Boston Gaz.

From the American Farmer.

PLANTATION OF THE WHITE MUL-BERRY.

The best method of multiplying the mulberry your wood house in August and September, and "ed; then work them well together with urine tree, is from the seed; for as it grows it becomes accustomed to the climate, as if it were indigenous. It ought to be taken from the nursery at the end of two years, and placed in a dry and elevated place, about filteen feet distant from any other tree. Two years afterwards it ought to be transplanted, and placed at the same distance; again, at the end of two years it ought to be transplanted, and always at the same distance. It may also be multiplied by slips or suckers, but it degenerates, and in the end perishes in the tlower of its age.

The eggs of the silk-worm must be hatched leaves have all their sap, and are still extremein order that the requisite quantity of eggs may be hatched. One ounce of eggs will produce 40,000 worms, 50 pounds of leaves are suffiwill not produce more than from 60 to 80 pounds.

The house should be very dry and well aired; the shelves on which the silk-worms are placed should be of wood, dry and without any peculiar smell-no bad odour should be suffered and air are excluded, it must perish .- If you must be taken to prevent the morning air from to be diseased, they must be thrown away, lest the disorder should be communicated to the rest. When the time of making cocoons has come, small branches must be placed in the shelves and the worms must in no wise be disturbed .--When the cocoons are made, the handsomest are to be left for seed; the others are to be detached from the branches, and thrown into boiling water; the thread loosens itself, and is to be divided upon a spindle. The price, five

> It is necessary that the work should be directed by persons of judgment, either for watching the silk worms, or for choosing the leaves.

> Extract of a Letter from General La Fayette to J. S. Skinner, Editor of the American Farmer.

"La Grange, Jan. 20, 1826 .- It is not an easy task for me to submit to the wide material separation which now exists between me and my American friends, while my mind is constantly with them; and the regret for the loss of their society mingles with an ardent sympathy in their We have recently examined a beautiful piece public and personal concerns. So prompt I have been in recovering pleasing habits, and so much them would I feel any objection but to the lime, ry in Framingham, which is for sale by Messrs, attached I feel to my new as well as my old Kilham & Mears, pronounced by good judges to connexions in the United States, that it seems be equal to the best English cloths imported in- to me quite strange to think this winter will to this country. We understand that some of pass without meeting any of you, either at Balthe same description of goods have been order. timore or Washington. I am eagerly waiting ed by merchaot tailors in New York, who give for the papers and letters from my friends, and

The affectionate reception I have met from covered with straw, and then the straw set on actions on the lest meda of cultivation, cianting and the people on my journey, and on my arrival to fire, the flea will not injure the plants as they proming the vine. this part of the country, and the family and friendly enjoyments that awaited me, have been sadly troubled by the illness of one of my granddaughters, who, contrary to all expectations, is happily recovered. I have passed hitherto, most of my time at La Grange; but am now going for two or three months to town, saving some excursions to my farm. I must give you an account of the stock you so very kindly assisted in forwarding and increasing. One of Mr. Patterson's Coke Devons, the elder bull, died on the passage; the three others have recovered from the fatigue, and are now in fine order.* The giant wild Turkey we have admired together, died also at sea,-his brother, and another from General Cocke, of Virginia, arrived safe; two small Virginia hens'never could retrieve the injuries of the sea, but the males are very hearty. Your two hogs have well supported the voyage, and are better shaped than any I have seen, although I have chanced to obtain the best of an importation from England. The Virginia plough you have been pleased to forward, has been presented for examination to the Central Society at Paris. I expect their report. I was anxiously looking for the arrival of two models kindly promised; the one a steam machine, after that of Mr Robert Smith-the other a threshing machine; this is sent by Gov. Sprigg, the sleam one by Mr. Morris.

Should they be ready to reach New York by the first of April, Capt. Macey, who sails on the 5th, and comes himself to Paris, will take charge of them. Permit me to entreat your kindness for two other articles: I much wish to introduce at La Grange, the pretty American partridge, so called in the south, and quait, in the dose. north, and the terrapin, about whose management I would need an instruction. Captain Subscription for Vine Stock of the Finest Table Macey would take care of them, and if the kind friend, Joseph Townsend, who had found the mammoth Turkey, persist in his good intention to send some more, or you could get some of the tame breed, second or third generation, at the good Postmaster's at York, Pa. Capt. Macey

might be entrusted with them.

I have on my farm a fine shepherd's dog, and can find a proper slut for him, but the more l inquire and see about those dogs, so very sagacious and useful here, the more I find that their principal merit is lost when they have not to execute the orders of a shepherd in the marshalling of a flock.

No letter from you, my dear sir, no number of the American Farmer has been received, although I hoped it might come by the last packet; Charles Lasteyrie went to Italy immediately after my arrival; he is daily expected at Paris.

The Garden Flea - This is a small fly that eats cabbages, and other plants while they are in seed leaf. They are nearly black. Some call them snow fleas. A correspondent informs us that if after the seedsare sown, the ground be

come up .- Penobscut Gazette.

American Manufactures .- A Montreal paper mentions, that great quantities of goods, of the manufactures of the United States, have lately been transported across the line into Upper Canada; and that a large part of that province is likely to be supplied with some of the coarser articles, cheaper than they can be imported from England, as the duty is only 16 per cept.

Niles' Register .- A resolution passed the House of Representatives on Friday, authorizing the clerk to subscriber, on Jamaica Plains, in Roxtury, by applyuse of the members of Congress. Mr Niles will receive \$1000 from the contingent fund for his books.

The Legislature of New Brunswick has been proregued. Among the acts passed is one making an appropriation towards establishing a University in New Brunswick.

Wool. -It is stated in an English paper, that 60,000l. worth of wool was offered without effect, as a security for a loan of 8,000l.

The house of Representatives has ordered 3,000 copies to be printed, of the interesting Report of the Board of Engineers relative to the proposed National Road from the City of Washington to New Orleans.

A New Article of Export .- Five hundred bibles have been lately sold in the Mexican market at wholesale for \$2,000 ! 500 bibles sold readily at a profit of more than 400 per cent, and apparently an unlimited demand for more!

An Elephant, which gave symptoms of madness, was lately shot in England. 14 men fired upon him several rounds, 132 bullets were discharged, and he was thrust through the neck with a sword, before he was killed. Yet a few years since, in York, Me. an Elephant was killed by a single bullet, fired at him by a fanatic, from behind a tree or wall. The English Elephant was II feet high, and weighed 5 tons. He had been physicked when sick-and 100 lbs. of salts were used for a

Grapes.

ANDREW PARMENTIER, at the Horti-ANDREW PARMENTERS, at the cultural Garden, Brooklyn, corner of the Jamaica and Flatbush road, two miles from York having been urged by several

lovers of the vine to propose setts of the best kind for sale by subscription, off rs to the Public setts of a dozen vines, with good roots of the most select and choicest grapes for the table; many of which are quite new in this country, and all of which will ripen perfectly in any situation either in town or country.

Names of the Twelve Sorts.

1. White Chasselas, with large fruit

2. Chasselas of Fontainebleau, near Paris

3. Yellow Chasselas of Thomery, near Paris

4. Golden Chasselas, the real gennine

5. Musk Chasselas

6. Chasselas, with very large black fruit

7. Red Chasselas

8. White Muscat, or black Constantia 9. Red Muscat

10. Black Muscat, or black Constantia

11. Black Orleans, bears very well the frost 12. Black Gamet, yields a second crop of blossoms

and fruit, when the first are frozen

Nos 11 and 12 are as fine for vineyards as for the table, the fruit is not so excellent as that of the preceding kinds, but is equally valuable on account of the certainty of a large crop annually.

The Subscribers will receive their vines in the course

of the present menth.

Mr John T. Boyd & Co No. 137 Broadway, New York, are empowered to receive the subscriptions:-Price Eight Dollars; gentlemen becoming subscribers, are solicited to give their addresses with care to avoid mistakes.

The subscription receipt will be accompanied by di-

The same sorts of vines may be had sopar stely, price One Dollar, except No. 4, Gorden Chasselas, the gennine, which is Two Dollars. Communications for the above and subscriptions to his establishment plat paid punctually attended to.

With about 200 varieties of Ornamental Seeds, Green House plants, Dahlia roots and Shrubs, viz. Goeseherry and Currant Bushes, Grape Vines, Honeysuckles, Quicks or Thorns for live fences, and a few superior standard pear trees.

Also, Woad or pastel seed, recommended to Dyers, Manufacturers and Agriculturists. Price \$1. per bush-St.

ROMAN. An elegant, full bleoded horse, a bright Bay, with black legs, mane and tail, of high spirit and good temper, will stand at the farm of Mr Stephen Williams in Northporough, (Ms.) at \$20 the season, to be paid before the mares are taken away.—See New England Farmer, April 14.

^{*} These were of the pure blood, all generously presented by William Patterson, Esq to the old American veteran.

t Instead of a model, Mr. J. B. Morris sent him a complete and very elegant steam apparatus, for steaming food for fifty head of stock, with every thing prepared for immediate use. It must have cost several hundred dollars.

ON LANDSCAPE AND PICTURESQUE GARDENS.

of embellishing Gardens, and truly to enjoy the thrown into the manure yard, and which, when beauties of nature. The English have taken given to stock without roots, bind their bowels, such advantages of the situation and soil of their and leave them in a very unthrifty state, which country, that it forms as it is, merely one vast is effectually corrected by the mixture of roots, Garden.

A good choice of the spots to be cultivated, and of those which should contain groups of trees, ought to be made; for they not only afford changes highly advantageous to the differ- had some previous mellowing crops, such as ent points of view, but also add considerably to corn, potatoes, clover of one year's standing, &c. the value of the property on which they are plough the ground in the fall or winter, in the situated. When united with these there is a following manner: with two horses plough a river or a stream, what new advantages are presented for embellishing a Garden. The country second two horse team follow the first plough seats which surround the city of New-York are in its furrow, with what we call a subsoil plough, most beautifully situated, but we cannot avoid which loosens and putverizes the subsoil in the a feeling of regret at not seeing them accompanied with some plantations and groups of eight inches more, and leaves the pulverized trees happily disposed, which would not only subsoil to be covered by the next furrow of the add to their heauty and afford cool and shaded walks, so agreeable during the heats of summer, soil on top, and mellow to the depth of 12 or but would have the advantage of increasing the 14 inches, which is absolutely necessary to the real value of the property, in proportion to the production of these tap-rooted vegetables; in number and value of the plantations made. A the spring, as early as the ground is dry, crossfew paths winding without restraint through the plough in the same manner as above, then spread grounds, and leading to those parts the most on a good coat of well rotted manure, and beautiful, not only on account of the view of plough it in 4 inches deep, and harrow or scarihabitation. A few fabrics, rustic bridges, hermitages, a Temple, or a Chinese Kiosk or Paa country seat.

These kinds of gardens are not very expensive, the unevenness of the soil being rather a beauty than otherwise, and of which advantage would be taken. If there are already cultivated grounds, they need not be rejected; for every thing that produces is interesting—only they should not form the principal object.

Mr. Andrew Parmentier, lately from Europe, where these gardens are generally adopted, has made at his place, at the division of the Jamaica and Flatbush turnpikes, at Brooklyn, L. I. a garden of this kind, which will be the more interesting on account of the great variety of foreign trees and plants he has there introduced. It is but half an hour's walk from New York.

Mr P. by the advice of several of his friends, will furnish plans of landscape and picturesque gardens; he will communicate to gentlemen who wish to see him, a collection of his drawings of Cottages, Rustic Bridges, Dutch, Chinese, Turkish, French Pavilions, Temples, Hermitages, Rotundas, &c. For further particulars, inquiries personally, or by letter, addressed to him, post paid, will be attended to.

From the American Farmer.

ON THE CULTIVATION OF MANGEL-WURTZEL, BEETS, PARSNIPS AND CARROTS.

The three first thrive best on a deep moist sandy loam, and as these crops are becoming every year more important in field as well as garden culture, and they having long since been satisfactorily proven, not only to be very useful, but almost indispensable, in keeping stock

in fine condition through the winter months, when sliced and mixed with straw-does away It was reserved to the delicate taste of our the necessity of hay-and works up the straw age to make the most happy changes in the art and chaff which otherwise would have to be and will also fatten them with the addition of a small portion of meal.

My method of cultivating these roots is as follows: for these crops choose land which has narrow furrow as deep as you can, then let a hottom of each furrow to the depth of six or the water, but also of that of the neighboring fy until the ground is fine. I then proceed to instrument made as follows: take a piece of oak scantling 4 by 4 inches, 7 feet long, into goda, not expensive in their execution, would which bore 4 holes 2 feet apart, commencing advantageously complete the embellishment of 6 inches from the end, with a two inch anger, long, (beside the part in the head) to which oak pieces attach a pair of shafts and handles, and by the assistance of a horse, all the drills may be made of regular width, and of proper depth and drill both in together; if dropped by hand they must be covered with a mixture of well rotted manure, or rich earth from the woods, both which will prevent a crust from forming over the seed and will promote the growth of the young plants, as soon as they are cleverly up: weeds will also appear, and must be removed whilst in a red state by hoing and hand mangel wurtzel to twelve inches apart in the to test the result. rows. The next dressing may be performed by a small cultivator, and the last one may and ought to be done to the depth of 6 or 8 inches, by the subsoil plough, running it as near the rows of plants as possible without disturbing their roots by which means the congealing effects of droughts are prevented, by keeping the ground in fine mellow tilth all the dry season; by giving them the finishing hoeing and cleansing after the subsoil plough, the crop is made; in this way root crops may be raised in great quantities, and at a very small expense, compared with the usual garden methods.

ROBERT SINCLAIR.

four ewe lambs all of which are living and doing foreign manufactories. But the case is now vewell .- Wor. Spy.

From the N. Y. Statesman.

TO WOOL GROWERS AND MANUFACTU-RERS.

It is well known that American and Saxony wool do not make cloth of so fine a texture as the French and Spanish. The French, Saxony and American sheep are all originally from Spain; yet the French and Spanish wool will make cloth of finer texture, whilst that which is fabricated from the Saxony and American is uniformly loose and spongy.

It is important to the wool grower, as well as the manufacturer, that this delect should be removed, preparatory to which it will be necessary to discover the cause. Having turned my attention to the subject, I submit the following as at least a probable theory, which may be

easily tested by experiment.

As the animal from which we obtain fine wool has the same origin in all countries, it is a legitimate conclusion, that the cause is not in the wool, but in some difference in the preparation subsequent to shearing. The Spanish and French wool is sorted as soon as the flocks are shorn--it is then scoured in hot water and packed; in this state it remains for six or twelve months refore it is worked into cloth. The Saxons and Americans wash their sheep before shearing, and pack the wool with all its yolk and grease. It is said to be an established fact, that wool packed in its yolk and grease will country seats, would lend a new charm to the lay out the drills two feet apart by means of an continue to organize after it is so packed, and that for a considerable time-that is, a given weight of wool packed in its yolk and grease, without scouring, will be found to contain more wool after being so packed for six months than into which drive strong pointed pins 7 inches if scoured when taken off the sheep's back. I apprehend that the wool formed after the fleece is taken from the living animal, is but imperfectly organized, that it is more greasy than genuine wool, and that in the process of fulling to receive the manure and seed, and then drill instead of creeping into shorter lengths by the in the seed, which may be performed by mixing friction of the hammers, it has a tendency to them with sifted wood, ashes or fine manure, slide over each other, making the ground of the cloth thick but not firm.

I do not consider this as an indubitable theory, vet I consider it so far reasonable as to deserve an experiment, which can easily be made by any of our wool-growers. I would recommend them, at their next shearing season, to have a part of their fine wool sorted and scoured as soon as shorn. Let this be packed as soon as picking; the parsnips and beets ought to be it is dry, and in four or six months afterwards thinned to six inches, carrots to three inches, put it in the hands of some skilful manufacturer HOPSON. .

AGRICULTURE.

As circumstances alter, there should be a corresponding change in the policy and measures of every vocation. The truth of this assertion will be evident to all, on a little reflection.

The design of the present remarks is to show the necessity of some change in the articles of produce among our farmers. Uotil within a few years, we have been almost exclusively an agricultural and commercial people; and the attention of the former class has been directed to those products most in demand by the latter. These have been principally beef, pork, butter, Prolific. - A Mr Chase of Sutton, Mass. has a cheese, and some other articles of provisions sheep which brought him the present season, and raw materials, suitable for exportation and in New England. It is not necessary to go in nal, in the summer of 1817, there were scarce tal to the United States. It is sufficient for the years, some idea may be formed of the enterpresent object to know the fact. That some change is necessary, appears from the general of their business.

In view of these circumstances, would it not suggest among these, wool, barley and hops.

flocks of sheep. In the first place, the large ed. The state of New York has finished her quantity of land in New England, susceptible of proportion already. - Con. Cour almost no other use than that of pasturage, might be made very profitable. It is also stated by some, that the land fed upon by Sheep is gradually tertilized, and its value enhanced. Another reason is, the small expence of keeping these animals during the winter which, it is believed, bears no proportion with that of most others of equal value and profit. There is no other that gets its food from the fields so late in Autumn, or so early in Spring, as the Sheep. Another is, the great certainty of the annual profit they yield. Wool and lambs almost always find a quick sale, and at a fair price. The increase of the flock, under careful and judicious management, cannot fall much, if any, short of defraying the expence of keeping and tending it, and the Sheep, when unfit to be longer kept, may be sold to the butcher for the first cost; so that the worl, in common cases may be considered as the interest of the capital invested.

The inducements for growing Barley are principally these-the increasing demand for this grain by the breweries, the bigh price it hears in proportion to other products, and the trifling labor and expense, together with the greater certainty of a good crop, in its cultiva-

Canals .- A late N. Y. Observer contains a table, prepared by the Editor of that paper, principally from official documents, which furcosts of all the important canals completed, in progress, or contemplated in the United States, and the adjacent British N. American Provinces. It is accompanied with a concise description of different works, and concludes with the following summary statements.

Upon a review of the whole ground, we find that there are now, actually completed, within the limits of the United States, exclusive of improved river navigation, 690 miles of canal, with 2645 feet of lockage, constructed at an exan estimated expense of \$10,250,000; making in all, completed and in progress, 1518 miles of of \$24,750,000. If to these we should add the hops, thus placing the hills of hops at least eight enough, make use of fine iresh mould, or of a canals seriously contemplated, and which will feet apart—put four cuttings from the running probably be completed in ten years, the whole roots, about eight inches in length, into each any account."

ry different, -- Capitalists have already invested length of canal line would be extended to at hill and cover them the common depth of polalarge sums in manufacturing establishments, least 3000 miles. When we consider that at which are to be found in almost every village the commencement of the Eric and Hudson cato an inquiry why this change has been wrought, ly 100 miles of canal in the United States, and whether it is in consequence of a change of Eu-that our system of internal improvement has ropean policy or that of our own government; grown from that small beginning to its present or, whether it will be advantageous or detrimen- state and prospects in the short space of nine of manure to the acre (that which is coarse and prising character of our citizens.

In England there are more than one hundred complaint of our farmers of the unprofitableness canals, extending 2682 miles, constructed at an expense of \$132,000,000, and yielding an average income of ten per cent. on the capital inbe well for our farmers to grow those articles vested. England has been more than fifty years the hops every spring by the middle of May; more which are extensively consumed in the in completing this extensive line of inland navvarious manufacturing establishments? NEW ENGLAND FARMER.

FRIDAY, APRIL 28, 1826.

CULTURE OF HOPS.

(Concluded from page 311.)

The English growers of hops think they have a very indifferent crop, if the produce of an acre does not sell for one hundred and thirty three dollars, and frequently they sell for two hundred dollars; and have been known to rise as high as four hundred dollars. In the English estimate, the expense put down, is, what they can hire the labor done for by those who make it their business to perform the different parts of its cultivation. A great saving may be made by our farmers in the article of labour; for much of it may be performed by women, children and the aged. Add to this, we have another advantage of no small moment. In this country the hop harvests will come between our two great harvests, the English and the Indian, interfering with neither; but in England the grain and hop harvests interfere, and create a great scarcity of hands, it then being the most busy season of the year. It is found by experience. that the soil and climate of the Eastern States are more favourable to the growth of hops than Great Britain; they not being so subject to nishes a brief view of the routes, dimensions, and moist foggy weather of long continuance, which the Southern States are still more favourable to the hop than the Eastern States, in point of flavour and strength. The state of New York, unites some advantages from either extreme of

An excellent article on the culture of hops, written by William Blanchard, Jun. Esq. of Wilmington, Mass., was published in the New England Farmer, vol. ii. p. 52. Mr Blanchard recommends ploughing the land nine or ten inches pense of \$14,500,000; and there are now in deep in October-harrow thoroughly in the progress, and to a considerable extent, under spring in the same direction the land was depth of rich mellow mould dig the hole a toot contract, 828 miles of canal, with 3,611 feet of ploughed-manure about 16 cords to the acre, and an half or two feet deep; the hops will lockage, to be contemplated in a few years, at cross plough the same depth-furrow at least thrive the better. toes preferable) the first year with the hopsplant every other hill in every other row with it it be good; but if the earth be not rich

toes-keep the hops clean from weeds by hoeing the crop among them-in October cover each hill with a shovelfull of compost manure. that from the hogstye preferred-in each following spring, before the hops are opened, spread evenly over the yard about eight cords strawy preferred) plough the land both ways at the first hoeing-but three hoeings in a season. unless necessary to subdue weeds-the last time of hoeing about the beginning of August, or when the hops are in full blosson.

" After the tirst crop it is necessary to open which is performed by making four furrows between the rows, turning the furrows from the hills, and running the plough as near the same as possible without injuring the main roots .-Then the earth is removed from the roots with a hoe—all the running roots cut in with a str rp knife, within two inches of the main roots-the tops of the main roots must also be cut in, and then the hills covered with earth about two inches deep."

The poles should be set as soon as the hop vines appear, which will save labour in tying up the vines. Mr B. allows but two vines to a pole, and two poles to a hill, [instead of three poles to a hid, as recommended in the Transactions of the Agricultural Society of New York,] poles not to exceed sixteen feet in height. The most thrifty vines must be selected, and trained to the poles by fastening them by a piece of yarn, slightly twisted by the thumb and finger. Frequent attention is necessary to tie up the vines," as they are subject to be blown off by high winds. The hops are ripe about the beginning of September, and should be immediately gathered, and picked clean from leaves and stems. Care should be taken, when gathering the hops, to cut the vines two feet [the New York article says three feet] from the ground that the vines may not be injured by bleeding."

With regard to curing and drying hops, we must refer our readers to Mr Blanchard's communication, [N. E. Farmer, vol. ii. pages 52, 53.] We would republish the whole article for the benefit of recent subscribers, who are not in possession of that volume, did our limits and other claims on our attention permit.

D Deane observed that "the time to plant hops is when they begin to shoot in the spring. The sets are cuttings from the roots or branches which grow from the main root They should be trom five to seven inches long, with three or more joints or buds on each, all the old and hollow parts being cut off. Make holes twelve or sixteen inches wide, and of a depth proportioned to the nature of the ground. It shallow, with hard clay or gravel under, dig not into it, lest you make a basin to retaio water; but raise a small hill of good mould. If there is a good

"When all things are ready for planting, fill up the holes with the mould before thrown out, raise hops from the seed. Perhaps some advantages might accrue from raising young plants in that manner. Like other small seeds it is probable that those of hops would lose their power of vegetation, if exposed too long to air above ground. We should therefore advise those, who might feel inclined to make experiments to the earth as soon as they are thoroughly ripe in autumn. In other words to sow them by art as soon as nature would have sown them, if the hop vines were left without gathering their produce. A few hills might be left for the purpose of ripening some seed for experiment. It is not impossible that hops as well as potatoes may be benefitted by renewing the kind, or introducing new varieties from seed. But this is merely conjecture, we speak without books, or other authorities on this point, and our hints may pass for what they are worth.

When hop plants first shoot in the spring, and are not more than 3 inches long, they may be cooked and eaten like asparagus, and are said to be not only palatable but wholesome. They are recommended as useful in scurvy, jaundice, costive babits, &c. Willich's Domestic Encyclo-ics of the bein described and syrup-spel, wers are & 1 to be thended with much be selft in pestilential forcers; a pillow filled with them, and had brocath the head, has been found to procure sieen to patients afflicted with of Northborough, Mass.] I should lear to write found to procure sleep to patients afflicted with delirious fevers. Dr Cooper adds, "the tincture of hops is also a very useful and not inflammatory nucotic; in many cases preferable to opium. Fill a hottle with hops, pour in fourth proof brandy; keep it warm for three days; strain it; from two to three tea-spoonfuls is a dose."

BREEDS OF CATTLE.

(Continued from page 287.)

In our preceding observations on this subject, we gave a number of British testimonies relative to the distinctive properties of the short horned second calving. breed of cattle. We will now direct our attention to the character given of their race by some of those American cultivators, whose opinions have come within our notice. And we would observe that Col. Pickering does not appear to and the stall I speak with the utmost confidence have been attributed to him. In his last E-say "On Improving the Native Breed of New England Cattle," (New England Farmer, vol. iv. p. larger than our native breed, I suppose is not to be controverted. English writers declare ed for beef not for labour; and where they have this year a three fourths heifer calf from a half this for us. She offers you the effect of 50 years' richer pastures than are generally to be found blood of Denton by Admiral, the famous bull experiment. Will you refuse it? We hope not, in New England, at least in Massachusetts."iv. pages, 90, 91.) Cot. Pickering says a lhave others by the celebrated bull Coelebs, or Den-

We have seen no notice of any attempt to horses; and raise oxen or rather steers merely great power, and they have much quietness and for beef."

"My real object is, to improve, by the best means, our native breed of cattle. If on fair short horns, and as respects certain properties, and full experiments, crossing with the improved short horns, or with any other foreign breed, shall be proved to be most efficient and advantageous for the combined objects of New Engon this branch of husbandry to commit the seeds land farmers, labour-beef-butter-cheese; and land Cattle." Some of those questions could particularly if all these may be obtained, as is not be answered except by accurate expericonfidently said, at less expense of keep, than with the present breed,-then let every one exert himself to partake of the boon.- I have been willing to be one, to make the experiment; and accordingly sent a large cow, of the Bakewell blood, to the Admiral; and it was the anticipation of a bull on my farm, which prevented my sending a second, one of the two just above mentioned. I also recommended to the farmers of Essex (by handbills distributed through the county) to make a similar experiment."

The Memoirs of the Pennsylvania Agricultural Society contain a communication, made by His Excellency Levi Lincoln, Governor of Massachusetts, President of the Worcester County Agricultural Society, from which the following is extracted.

"Upon the subject of Denton's progeny [a hull of the short horned breed, imported from to any one less observing and sanguine than yourself. With nineteen of them, of different grades and ages, in my possession, I can safely say, that my most confident anticipations have been entirely answered. I have now seven heifers in milk, four of them 3 years, and three 2 years old; and for richness in quality, and abundance in quantity, they are not excelled by the very hest cows of any age of the native stock. A heifer of 3 years, with her second calf, has not been dry since she dropped her first, having given four quarts on the morning of her

"Next to the Merino sheep, I consider the introduction of the short horns, in the blood of Denton, as the richest acquisition to the country which agriculture has received. For the dairy appearance, and greatly excelling any I have before seen. One of the heifers gives from 16 sent out by Sir Isaac Coffin last year, to the

docility."

This is strong testimony in favour of the perhaps as conclusive as the nature of the case will admit. It does not answer the questions proposed by Col. Pickering in his tenth letter " on Improving the Native Breed of New Engments, of several months,' if not years' duration, the results carefully noted, and all the circumstances, which could affect those results taken into consideration. But more of this hereafter.

The Massachusetts Agricultural Repository, for June 1825, vol. viii. No. iv. contains the following observations, which are selected from other remarks on the same subject, favourable to imported breeds of cattle, as well as to improving our native stock, as recommended by Col. Pickering. ".We say nothing of the professed exhibitions of rare animals, but this we do say, that when w. travel through England, we find ourselves among a race of horned cattle, nearly every one of which we covet. Let Mr Marshall or Mr Young (old writers) say what they will, nothing can destroy the effect of ocular demonstration. The cattle of England are' far superior to our own, as a body, and it is not precisely correct to compare individual exceptions in our country with general and average statements of whole counties in England. We are sorry to say farther, that the cattle of the low countries, and of Normandy, appeared to us much finer than our own, in a visit made to these countries eight years since. They were in better condition, and much fewer miserable individuals among them. They had learned the important lesson that a poor animal is not worthy of its support. We have always thought with Col. Pickering that our country possesses at this moment, a race of cows, and possibly of bulls, which selected with care, their progeny raised and kept from contamination with inferior animals, for five or six generations would produce a race of cattle which we might show with pride in Smithfield. But who are our capitalists that will select and take due care of them. Where is the man who has so cautiously guarded the progeny of a fine cow? and if entertain sentiments so hostile to this breed as of their pre-eminence. From my three years he did, unless he should raise her bull calves as old hellers I have calves of the most promising husbands, how can be hope to keep the race

"Would there be any question in the mind of 39) Col. Pickering observes "that the half to 20 quarts of the richest milk, by the day any sensible cultivator about to raise his own bried offspring of the improved short horns is since calving; the other a little less, from the stock, that if a neighbour had improved his own circumstance of having been in milk continual- race so that they were eminently fitted for the ly for more than a year; but her milk is in no various uses of this most important agricultural the short horns to be the largest breed in Eng- degree inferior in quality. The last season she animal for milk, for beef, and for draught, that land; and this with the quality of fattening at gave eleven quarts at a milking, with grass only, it would be for his interest to procure that stock an early age may recommend it to farmers in and this not unfrequently. They keep as easily and to sell off his own miserable breed? We those parts of our country, where oxen are rais- as the native stock, and are as hardy. I have trust not. Well, then, another nation has done

"The Massachusetts Agricultural Society of-Again, in the same essay (N. E. Farmer, vol. Massachusetts Agricultural Society, and two fered a premium for the importation of the best races of Great Britain. They came. The preno disposition to question the character of the ton's half blood. They are fine promising aci- miums were awarded. The public admired the

pronounced them; they awarded the premiums, attendance than most farmers bestow on their Still this may be all infatuation. The mere love of novelty. They produced calves; the calves were better formed, grew faster, had flesh on more valuable parts, had better hair and "finer feel," indicating a disposition to fatten; they weighed more on the same keeping. Was all this illusion? We think not. We say we think not; we add, we know it is not all illusion .-We know it to be founded on good and substantial grounds. We had some excellent cows of native race which we had carefully kept thro' three successive generations, and we have been amply rewarded for it. We have recently crossed them with the foreign breeds; the calves were manifestly superior. Not having a large farm, we parted with the calves to our friends, stitution (if that be a proper expression)—the and recently upon inquiry of a friend who had two of our calves, and had a stock of eleven cows, we found the two highest, as tu milkers, were of this mixed race.

"We have now two cows of the mixed race, one out of Fill Pail, and one out of Mr Parsons' Holderness, and they are much superior to any cows we have been able to purchase for 20 years. We are now raising calves of the half aged. One advantage they certainly have; they keep their flesh better without diminishing their milk. Still there are native cows, a very few, as good, and some better.

"We now proceed to the most important consideration in relation to these imported animals.

"Their calves sell better; they are more carefully watched; they have introduced a habit of attention to stock; they excite a spirit of rivalry, and one of the most valuable and important effects of the late interesting letters of Col. Pickering will probably be to induce our farmers to codeavour to compete with and surpass the imported breeds.

"While Col. Jaques, the most successful and the most intelligent of our breeders, who under great disadvantages of location, seems to rival the celebrated Bakewell in his skill and attention, can sell his pure breed, as he has done this spring, at 300 dollars for an eight months' bull calf, there can be no doubt that the experiment will be fairly tried. As Col. Pickering does not seem to believe that any serious evil has resulted from the importation of a worse stock, we think we may safely encourage the crosses of this race with our own, keeping in mind as we ought to do, as he wisely suggests, that far the most ready and rapid way to improve our stock. is to select and raise only the best of our own

The above extracts from the Mass. Ag. Rep. were, we believe, written by the Hon. John Lowell, President of the Mass. Agric. Society; whose character as a scientific, judicious, and discriminating agriculturist could not be enhanced by our eulogy. The comparative merits of different breeds of cattle can be correctly estimated by those alone, who have kept both or all the kinds, with regard to whose superiority a question exists. Mr Lowell, having made long and continued trials of native cattle, and crosses with imported cattle, gives the preference to the latter. Mr Lowell, perhaps, as intimated by Col Pickering,* gave his cattle better food and

stock. His experiments, therefore, have not tested the hardihood of the cattle of either breed. Whether the short horns, or any other of the improved breeds will endure hard fare, careless attendance and exposure to the vicissitudes of the climate of New England as well as our common breeds, is a question; and we know of no facts, which may aid in its decision. But their acknowledged superiority in certain particulars does not imply, much less prove, inferiority in other points. If the short horns, or mixed breeds of which that breed composes a part, will thrive most on good keeping it does not follow of course that they would suffer most on poor keeping. The same strength of con same powers of digestion which enable them to thrive faster than other breeds on good fare, with good attendance, might cause them to make the most of the coarsest aliment and suffer the least from the severest hardships. This, however, is a question of fact, which can only be decided by experiments.

Sea Kale Seed .- WILLIAM AUSTIN Esq. of Charlesblood to supply the cows which are now getting town Mass, has favoured us with a quantity of the seed of the Sea Kale for gratuitous distribution. This is a valuable vegetable, superior in some respects to asparagus; coming forward earlier in the spring and is used for the same purposes. It may be cultivated exactly like asparagus according to Mr Cobbett. It is well, however, to bleach it by covering it with either pots, or et, a general asortment of GARDEN SEEDS, of last some substitute to seclude it from light, when it begins to grow in the Spring. Mr Austin says the seeds when planted should be cracked, or the outside cover broken to hasten and insure their vegetation. For more particular directions relative to the culture of this plant, see New England Farmer, vol. I. page 42. vol. 111. 57 and 69.

> The Anniversary of the Hampshire, Franklin and Hampden Agricultural Society will be held at Northampton on Wednesday, October 11, 1826. A great number of Premiums are offered by the Executive Committee of the Society, embracing a great variety of the most important pursuits of rural economy. Rewards are offered for Stock, Household Manufactures, Agricultural Implements, Agricultural Experiments, Management of a Farm, Dairy, Turning in Green Crops as a Mannre, and Cider; besides " \$100 may be awarded house, 108 State streetin gratuitous premiums.-All premiums awarded of three dollars and over, will be paid in articles of silver plate, unless it should be convenient to procure a few copies of the New England Farmer, bound, for a similar purpose."

Public Improvement .- A meeting of gentlemen assembled on the 21st inst. at Johnson's Tavern in Medfield, and passed a number of resolutions relative to a canal communication between the City of Boston and the Blackstone Canal, and to co-operating with the Quinebaug Canal Association in extending said canal handsomely finished and gilt. to Norwich Con. Luther Metcalf, Chairman, George C. Wilder, Secretary. A committee was appointed, who drafted a Memorial to the Legislature, praying that Commissioners and an Engineer may be appointed to survey the route, with a view to ascertain the prac. ticability of the proposed canal.

We invite the attention of our readers to the notice in our advertising columns of this day's paper, of the Saxony Sheep, lately imported by Mess. George and Thomas Searle.

SALE OF SAXONY SHEEP.

Imported by George & Thomas Searle. On Thereday, 4th May next, at Brighton, near Boston, Will be sold at Public Auction.

The entire Flock of SAXONY SHEEP, imported in the ship Marcus, and expected per ship America, from Bremen.

These shoop were selected by the same Agents who nurchased the flock sold at Brighton last year, which have given so general satisfaction to purchasers.

They have been selected after a thorough examination of every fine flock in Saxony, without regard to expense; and gentlemen interested in the growth of fine wool in this country, may be assured that the present flock consists entirely of sheep equal to the best of any previous importations.

The whole number shipped in Bremen was 202 Bucks and 128 Ewes, of which about one half have arrived. A distant day is fixed for the sale to allow time for the arrival of the residue, in order that purchasers from all parts of the country may be assured that a sufficient quantity will be offered to supply their wants.

Samples of the wool from each sheep will be lodged with Messrs Peter Regisen & Co. Hanover square. New York-Benja, Knowes Esq. Albany-Mesrs Woodbridge & Washborn, Hartford-and with the Auctioneers, No. 69, Kilby st. Boston

The sheep may be examined at Brighton at any time before the sale-which will take place as advertised, at 9 c'clock. A. M. The importers pledge themsolves that every sheep shall be sold without any reservation, at public sale, and that none will be sold at private sale, previously, on any terms.

COOLIDGE, POOR & HEAD, Auct's

New Imported Garden Seeds. &c.

JOSEPH CALLENDER No. 166 Washington street pear the Old South, has just received per London Pack-

year's growth, viz :--Dwarf Marrowfat do Green Prolific do Dwarf Bordering do Scarlet Radish, Red and white Turnip, Early Head Lettuce, Grand Imperial do Globe Savoy Cabbage, Early Dutch do True Swedish Turnip,

White Dutch Turnip, Field Turnip, Blood Beet. Mangel Wurtzel. Double curl'd Parsley, Long Southgate Cucumber Sweet Marjoram, Summer Savory, Thyme and Sage. White Cellery, Lemon Balm.

Also, a few bushels superior English Split Peas. On hand, a large assortment of American Seeds of last year's growth; Canary, Hemp, Millet, Rape and Maw seeds for Birds; a large collection of Green House Plants, Shrubs, &c.: Flower Pots and Flower Boxes. April 21.

Farming Utensils.

JUST received and for sale at the Agricultural Ware-

TICE's No. 2 Ploughshares.

On hand, a few of Tice's No. 2 Ploughs-a constant supply of Shares furthshed for the same.

HOWARD'S Cut and Wronght Iron do.

TREE-BRUSHES. PRUNING BOW SAW, recommended by LEWIS HUNT, Esq.

Common do. PRUNING CHISELS and AXE.

PRUNING SHEARS.

Likewise, a further supply of improved PRUNING

Brass and Tin HORN TIPS for Oxen's Horns-some

2000 very thrifty and well proportioned CHESTNUT TREES, for sale as above. april 21

BELLFOUNDER. This celebrated horse, of a

bright Bay, with black legs, standing 15 hands high, a celebrated trotter, and a true descendant of the Fireaways, will stand at Col. Jaques' stable, in Charlestown, during the season. Charge \$20, and \$1,00 the groom—see New England Farmer, April 14, 1826.

PATENT HOES .- J. & A. Fale's Patent Hoes constantly for sale by French & Weld, 31 & 32 South Market St., and French & Davenport 713 Washington Street, who are appointed sole agents for vending the Boston, April 28, 1326. eptf. same.

MISCELLANIES.

[From the London Literary Gazette.]

THE FAREWELL.

Days of my cherished youth, farewell! Ye fleeting joys, adicu! Hence, Mcmory! hence thy potent spell!

Cease on the happy past to dwell, Nor vain regrets renew!

Hope, joy, and Love, ye spectres bright, ye vanished shades, adieu!

Thoughtless and young, a wreath offlowers Around my brows I bound, And fondly sought those blooming bowers, Where, circled by the laughing Hours, I dreamt that Love was found; Fancy and Hope before me flew, and scattered fragrance round.

Days of my cherished youth, farewell! Ye pleasant scenes, adieu! No more of tranquil hours ye tell, When all unheard Time's footsteps fell, And all unheeded, flew;

Dreams of the roseate morn of life, a long and last adieu!

Reflections upon Marriage. - Rome was surprised when great Scipio repudiated his wife, and more particularly as she appeared to possess those qualifications which could render her husband happy. In justification of his conduct, the noble Roman assembled his friends, to whom he showed his foot. "Behold, how well this sandal is made, how proper it is—but none of you know where it pinches." Without disparagement to the Roman general, there is rarely a shoe after marriage that fits well to the foot. It is with marriage as with masonry, it is only the brotherhood who know the secret.

Reflections upon the Growth of Luxury .- "] have often reflected how much Luxury has increased in London of late years. Down beds, soft pillows, and easy seats are species of luxury in which I have never indulged, because they tend to enervate the body, and render it unfit for fatigue. I always make use of hard mattresses, and accustom myself to the open air in all weather. I literally know two young ladies of high quality, (sisters) who employed a servant with soft hands to raise them gently out of bed in the morning! Nothing less than all powerful vanity could make such persons submit to the fatigues of a toilet."

Legal Dexterity. - Serjeant Davy having ahused a witness, as Serjeants will abuse witnesses. was on the following morning, whilst in bed, informed that a gentleman wished to speak to hun: the Serjeant concluding that it was a client, desired that he might be shown up; the visitor. stating his name, reminded the Serjeant of the abuse he had heaped on him on the preceding day, protesting that he could not put up with the imputations, and must have immediate satisfaction, or he should resort to personal chastisement. On this the Serjeant, raising bioself up said, "But you won't attack me surely while Pin in bed, will you?" "Certainly not," said the aggressed party; "I should never think of atticking a com in bed." "Then I'll he'd-d." say the Sorge ont, as he laid himself down, wrappl 3 the clathes round him, " if I get out of bed while you are in this town."-London Mag.

Art of Living Happily .- The following maxims, or rules of action, might, if strictly observed, go far to increase the happiness, or a least to diminish the inquietudes and miseries of life:-

Observe inviolably, truth in your words, and integrity in your actions.

Accustom yourself to temperance, and be

master of your passions. Be not too much out of humor with the

world: but remember it is a world of God's more comforts than calamities, more civilities than affronts; more instances of kindoess towards you than of cruelty.

Try to spend your time usefully, both to yourself and others.

Never make an enemy, or lose a friend, unnecessarily.

Cultivate such an' habitual cheerfulness of mind, and evenness of temper, as not to be ruffled by trivial inconveniences and crosses.

Be ready to heal breaches in friendship, and to make up differences, and shun litigation yourself as much as possible; for he is an ill calculator who does not perceive that one amicable settlement is better than two lawsuits.

Be it rather your ambition to acquit yourself

Despise not small honest gains, and do not risk what you have on the delusive prospect of sudden riches. If you are in a comfortable thriving way, keep in it, and abide your own calling rather than run the chance of another. In a word, mind to "use the world as not abusing it," and probably you will find as much comfort in it as is most fit for a frail being who is merely journeying through it toward an immortal abode.

The Rich and the Poor .- The rich have the most meat; the poor have the best appetite .-The rich lay the softest; the poor sleep the soundest .- The poor have health .- The rich have delicacies.-The rich hang themselves through fear of poverty; the poor (such as have always been poor) langh and sing, and love their wives too well to put their necks into the

The following anecdote, which illustrates very forcibly the condition of the soldiers of a despotic government is from the Paris Etoile of the 23d January.

It is said that during the revolt at St. Petersburgh, the promoters of it wished to make the soldiers cry; "Long live Constantine; long live the Constitution!" The soldiers not knowing who or what the constitution was, shewed much reluctance to cry out in its favour-when the instigators, put to their trumps, exclaimed that it was Constantine's wife, whereupon the sot diers began to shout out, "Live Constantine! live the Constitution !"

A Soldier's Life .- In the course of a late legal investigation respecting the military hospitals in Aracan, Dr Tytler stated that monstrous reptiles, engendered in the masses of filth which the soldiers bad been obliged to take for fond, were often observed crawling from the mouths of the Fruit and Ornamental Trees, &c.

Place noor the Renrick Place, near the Brighton Post Office. The Nurseries have been much extended, & besides a variety of English Cherries, Penrs, Apricots, &c. contain many thousands of grafted Apple trees of su-perior kinds, thrifty, handsome

and of good size. Also, some thousands of budded Peach Trees, remarkably thrifty, and comprising a choice collection of about 40 of the most approved sorts discovered in our best gardens, or brought to the markets ; the creating; and however sadly it is marred by Peach trees are from 5 to 8 feet high and sold at the wickedness and folly; yet you have found in it moderate price of 30 cents each. Of good sized ornatalpas; European Mountain Ash; Weeping Willow; Evergreen Silver Fir; and the Larch; Butternuts, and English Walnuts. Currant bushes of the prolific red kind, of all sizes, by the dozen, hundred, or thousand, on moderate terms. Also, the black, white, and Champagne do.; red, and white Roses; Lilacs, Senna, Gum Acacia, English Grapes, &c. Orders addressed to JOHN or WM. KENRICK, and

sent to the Brighton Post Office, or to the office of DA-NA & FENNO, Brokers, in State-street, will be duly attended to.

N. B. Trees will be packed in clay and mats for shipping, and conveyed to Boston, when ordered; and on Saturdays without charge for conveyance; but Gentlemen remote should employ some person to receive and pay for them.

In removing trees, one year's growth is frequently lost, if the trees happen to survive, by unreasonably diwell in your proper station than to rise above minishing their roots; therefore special care will be taken for their preservation.

Lead Pipe for Aqueducts, &c.

LINCOLN FEARING & Co. at No 110 State-street, have for sale, all sizes of Lead Pipe from 11 to 2 inches, warranted equal to any imported or manufactured in this country-Contracts for any quantity brade and furnished at short notice.

CRUDE ROCK SALT .- The Subscriber has for sale at No. 69 Broad Street,

50 Tons Crude Rock Salt, -in large lumps for cattle, or for sheep.

This article deserves the attention of Farmers, both for its economy and utility; being less than half the expense of the common salt, and less liable to waste.

ORIGINAL COMMUNICATIONS.

TO THE EDITOR OF THE NEW ENGLAND FARMEL.

SIR-In No. 36, vol. iv. New England Farmer, "Breeds of CATTLE," you have quoted from 44 Memoirs of the Pennsylvania Agricultural Society," page 74, certain "selections," which you have erroneously ascribed to Culley.*

The chapter from which these extractione taken, is headed " Notices on Cattle, from Lawrence's, Parkinson's, and Culley's Treatises on Live Stock-Bailey's Survey of Durham .-Strickland's Survey of the East Riding of Yorkshire-and the General Report on the State of Agriculture, &c. in Scotland,"

The various paragraphs are designated in succession, beginning with Lawrence, and coding with the East Riding of Yorkshire. As the extract from Culley happens to be at the head of page 74, and the

" EAST RIDING OF YORKSHIRE"

in the same page, you ascribed to Culley, the extract taken from "Strickland's Survey," 1812. made by order of the British Agricultural Board. The only extract from Culley, is the paragraph immediately preceding, viz.-" The ALDERDEY DRIED IS ONLY TO BE MET WITH, ABOUT THE SPAIN OF OUR NOBILITY AND GENTRY, upon account of their giving exceeding rich milk, to support the luxury of the tea table, &c. Indeed, if it was the neighbouring counties " not for the sake of method, and my believing them a distinct breed, I might have saved the much attended to by our British farmers."

In a former number of the New England Farmer, in quoting Lawrence, page 615, an " Doubtless THE FAULT I found with the form of be ascribed to the milkiness of the breed or the Alderney cross." Not to the "Holderness" cross as it is given in the New England farmer.

Lawrence, page 74 .- The ALDERNEY AND NOR-MAN CATTLE. "The cattle of the islands on the by the name of Alderney. These are a VARIETY OF, AND SMALLER THAN THE NORMAN : light red, yellow, dun, and fawn coloured; short, wild-TO THAT ANIMAL; THIN, HARD, AND SMALL BONED; IRREGULARLY, OFTEN VERY AWKWARDLY SHAPED .-This description refers chiefly to the cows .-They are amongst the best milkers in the world as to quality, and in that respect, are either before, or immediately next to the Long Horns; but in weight of butter for inches, they are far superior to all."* * * * * " This species is, in course, a proper cross for the large and coarse boned, but in that view I should prefer THE REAL

shaped than the islanders."

dent alludes, is as follows, "By this you will see the ral interest, in all his efforts in parliament, and DEVONS ARE NOT BAD MILKERS."-EDITOR.

ing the niest minute details of his farms; and although engaged in purchasing, and sometimes in selling the animals, bred upon his estate, was certainty No " DEALER IN LIVE STOCK," in his report 1819, to the Workington Agricultural Society, declares his intention " to keep distinct "the blood of Mr Donkin's cows," (Improved " Durham Short Horns) " which, in uniting the " two ESSENTIAL QUALITIES, OF MILKING AND FAT-"TENING, ARE HIGHLY VALUABLE." page 86.

. In selecting animals of this variety, it is essential not merely to look at the horus, but to regard the pedigree, for it is established, that certain streams produce good milkers, and good provers, in the language of breeders, whilst other streams afford bad milkers with perhaps,

more tendency to become fat.

The term IMPROVED DURHAM SHORT HORNS, happens to be the name of a race which accident or folly may have so named; for it is an have found beneficial for several years; and as very short horns, and that all animals having short horns, are not necessarily connected with that I have advantageously pursued. it. It would be scarcely less absurd to contend that all short men, must be clever fellows, be- necessary, and to no class is a strict adherence placing the hives in an ice house at the approach of cause a family named Short are highly gifted, to it more important than to Farmers. than to say, all neat cattle having short horns, are to be received as good, because a race named Improved Durham Short Horns, are known CURWEN. to be so.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

MANGEL WURTZEL AND SUGAR BEET. Worcester, April 29, 1826.

Sin-I was gratified on perceiving in your 39th No. an extract from the Mass. Agric. Re-pository, on the subject of Mangel Wurtzel, or Root of Scarcity. From my own experience I am satisfied of the correctness of the Abbe Rosier's statement respecting its easy cultivation and superior value. The product I have found not only greater, but of better quality, for the purposes for which I have used it, than that of any other vegetable which I have ever cultivated. It should be the object of farmers to furnish winter food for their milch cows, both succulent and nourishing. In these respects the mangel wurtzol and sugar beet excel. I mention both, as I give the preference to the latter, as of richer quality, and as it retains its virtues to a later period in the spring, when food of this kind is the most important. It is less productive, but the difference is fully compensated.

The last season I appropriated nearly half an acre of my nursery ground to these vegetables The rows of trees are five feet asunder. One half of the spaces between them was planted in a single row with the mangel wurtzel, and the other with the sugar beet. The leaves afforded an abundance of most valuable food for my cows and swine, and seemed not to be lessened by the drought. I called only the full grown and pendant leaves, which afforded four bushels per day through the season. As my cows had been some time in milk, a part of the nutriment in winter was necessarily converted into flesh. They were allowed three pecks each at two feedings, night and morning. Most of my swine were kept entirely on this root, previously boiled, mashed, and salted. Two breeding sows were restored to high flesh entirely on this food. On this spot of ground I raised 325 bushels of roots so well packed as to weigh 65 pounds each-

amounting to 21125 lbs. No other vegetable would have produced halfthis amount with the same expense and labour. If the land had been wholly cultivated with these roots, the produce would probably have been doubled.

O. FISKE. Respectfully yours,

TO THE EDITOR OF THE NEW ENGLAND FARMER.

LAYING DOWN LANDS TO GRASS,-FRUIT TREES, &c.

Durham, N. H. May 2, 1826.

Sin-I have been a subscriber and an attentive reader of your valuable paper for the last two or three years, and, I trust, not without imbibing some important hints, and useful lessons in the important art of husbandry.

The subject of laying down land to grass I have not seen treated exactly in the manner that I established fact, that this race has not always I deem the subject of some consequence to the torpid state and obliges them to consume their stores, agricultural community, I will state the mode and they are then starved with hunger.

In laying down land I have found the following mode attended with advantages over all others that I have seen practised, as attended with main in a state of torpor and require no food. As soon a saving of labour, productive of greater crops, and leaving the land in a better state. After the commence their labors with vigor. The intense deusual mode of putting grain into the ground, I sow my grass seed, and by the use of common iron garden rakes, I remove all small stones and rubbish, and cart them off immediately, then smooth the ground so that no ridges or points shall impede the scythe. One man can rake over an acre or more in a day, according to the state of the land.

FRUIT TREES.

Since I have commenced writing, I will beg leave to mention the mode of setting trees that I have practised successfully for nearly forty

I dig a space large enough to admit the roots in their natural position,-three or four inches deeper than they formerly grew. After placing the tree, the same part to the south as it grew, I cover the roots with fine, rich earth, and pour to a level with the ground, and tread it firmly in, to incorporate the wet earth with every fibre of the roots. I then draw up about the tree a concave hill to admit and preserve all the rain that falls for the benefit of the tree; and should the season be dry, I from time to time water the hill thoroughly, after using the hoe,-suffering no grass or weeds to grow about it.

Your ob't serv't, JOHN FROST.

PRESERVATION OF BEES.

Chester, N. H. May 1, 1826.

Mr FESSENDEN-1 was last fall interrogated by an old acquaintance, if I ever buried my bees to the depth of three or four feet, to combine the blossoms have yet appeared. preservation of their honey with the preservation of their lives.

Whether it was suggested to him by men of experimental knowledge, or by books, I do not know. I wish to submit the suggestion to you, Sir, and through the medium of your paper, to

hoping it will elicit something from some one, which may be beneficial to the public, and to a YOUNG INQUIRER.

By THE EDITOR .- We have no knowledge of any practice like that mentioned above; and should fear that the bees, if buried alive, would be suffocated for want of air. If however they were previously reduced by cold to a torpid state, and kept under ground, or in any other place where the air was below the temperature at which water freezes, probably the animation of bees might be suspended during winter, their stores preserved, and the insects revive in spring.

Dr J. Anderson in one of his papers on husbandry observes, in substance, that bees are frequently induced by mild weather in the winter, and early in the spring to leave their hives and by sudden changes to cold or wet, become chilled, unable to return, and perish. And when they do not venture abroad, warm weather, out of season, often rouses them from their

To prevent such accidents, Dr Anderson is of opin-Method in every parsuit of life is essentially ion, that "no method would be so effectual as that of winter. Here they may be kept till the spring is so far advanced that no danger is to be apprehended from bad weather. During the whole winter they will reas the mild weather invites them to appear, they will gree of cold which bees sustain without the least injury in Poland and Russia, where even quicksilver is sometimes frozen, removes every doubt or anxiety, concerning the safety of bees in an ice house."

We do not know that any thing has ever been attempted to ascertain the correctness of Dr Anderson's theory, but wish that some person would try the experiment, and give the result to the public.

FOR THE NEW ENGLAND FARMER.

PEACH TREES.

MR EDITOR-How is it that we are to have no peach fruit this year? on examining my trees yesterday, and I have a great number, I am sorry to find a total failure. Is it owing to the intense cold on the last day of January, and first day of February, when the glass was from on sufficient water to make the dirt very soft, 9 to 13 below zero, -or from the cold spell we and then apply another layer of rich earth nearly had on the 11th, 12th, and 13th of April-when the thermometer was from 20 to 23 at suprise, and when it froze in the shade throughout the day ?- I am much inclined to believe it is from one or the other of these causes. We have rarely had a season when more or better wood was made than in the last year. Three weeks ago the fruit buds of the peach looked perfectly well, and gave promise of a fine blow-and there is no appearance of disease about the trees. The fruit buds of other trees, such as cherries, plums, apples, pears, look very well; and will probably be abundant. They are much more hardy. The peach, you know, gives fruit only on the wood of the preceding year. No

A. FARMER,

From the United States Literary Gazette.

M'ADAMIZED ROADS.

The science of road-making (and in practical that portion of the community who may read it, importance it more justly claims the rank of a science, than many pursuits which have been dignified with that title) is just beginning to be understood in Great Britain. For about ten years the new method of constructing roads, first adopted and practised by Mr M'Adam, has been pursued there; and such has been the success the conviction of its superiority over all former conflicting interest and prejudice, which, in comall descriptions, mail contractors, and civil engineers, parliament and people, unite in the Discovery and introduction of Schuylkill Coalmost ample testimonials in its favour, and liberal grants have been made to Mr M'Adam in as a public benefactor.

these roads are constructed is all that our limits neighborhood more than forty years ago; and will admit. For a more particular and satisfactory account we must refer to the Essay of Mr. so very different from any which was previous-M'Adam himself, the eighth edition of which was ly known, it was not thought to be of any value, published in London the last year, and which and the search was abandoned. It is supposed we hope soon to see republished in this country, to be forty years, since a blacksmith by the His method mainly consists, after preparing the name of Whetstone, found coals and used them & Bishop, are we indebted for the discovery bed of the road for the purpose (in doing which in his smithshop. At a very early period, all the stones near the surface must be removed.) Judge Cooper declared his belief in the existin covering it with a floering of broken stone ence of coal in this district, and the Messes, of eight or ten inches in thickness, the largest Potts explored various places along the old Sunstone not to exceed six ounces in weight. These bury road, but success did not attend their opefragments of stone are soon worn smooth by the rations. A Mr William Morris, afterwards beimpenetrable mass, over which the wheels of the head of our capals; he found coal, and took any sensible impression. Another important 1800; but all his efforts to bring them into use, water-courses so as effectually to drain the his lands to their present proprietor, Mr Pott. water from the earthy bed of the road, that it may not be injuriously affected by the winter of the coal from the time of Whetstone, and the pervious covering or rooting of stone will prefalls upon it; and, thus protected, the road is it is constructed. Under such circumstances an earthy bed is even preferred to a rocky one, as smaller size are placed on the surface, the larger phia, got out a quantity of coal and took nine time become a tine tree. stones will in a short time rise to the top, thus making the surface rough and uneven, and at the coal met with a host of opposition. On two same time penetrable by the rain-water, which wagon loads, Mr S. got the carriage paid, the range of buildings situated in William and Gardation or bed of the road.

Such is a brief outline of the manner of making roads, which we hope ere long to see extensively introduced into our country.

ference to all other modes of making and re- not only a much better road, but a much more pairing roads in that kingdom. Travellers of economical one, than the old method of paving, interests of Pennsylvania generally,

Anthracite-Stone Coal of Schuulkill County.

We are led to believe that the following hisrempneration for his services in this department tory of the use and introduction of anthracite in Pennsylvania, will not be uninteresting to our A concise description of the plan on which readers. This coal was known to exist in this

> wagon loads to Philadelphia. SCIENTIFIC MEMORANDA, APPLICABLE TO RURAL ECONOMY.

Lime is an alkaline earth, and when divested of the acid with which it is naturally combined, is caustic like potash. It exists in rocks, in the shells of marine animals; with sulphuric day is counteracted by the absorption of aqueous acid in gypsum; with fluoric acid in Derbyshire spar, from which is manufactured vases and of the soil during the day, and by both the inteother ornaments; with phosphoric acid in the bones of animals and shells of eggs. To render carbonate of lime (common lime stone) subservient to agriculture and the arts, the carbonic acid is expelled by heat, in the common process lime. But its value as such is impaired in proportion as it recombines with carbonic acid, which it does rapidly if exposed to the atmosphere. It also possesses a strong affinity for water, and will absorb one fourth of its weight of that fluid; and yet remain perfectly dry .-The water becomes solidified, and identified with the earth. The heat, therefore, that is state, and does not proceed from the lime as is abound in this carbonate. sometimes supposed.-Parkes. Upon an average every ton of lime stone has been found on experiment, to produce 11 cwt. 1 gr. 4 lbs. of quicklime, weighed before it was cold; and that when exposed to the air it increased in weight daily, at the rate of a hundred weight per ton, for the first five or six days after it was drawn from the kiln .- Bishop Watson. These facts suggest the importance of transporting lime, where it is to be used at a distance from the kiln, as soon as possible after it is burnt; and also of using it speedily when its caustic qualities are to be relied on. Slacked lime, therefore, is a combination of 55 parts of lime, and 17 parts of water solidified; and in this state it is called hydrate of lime, to denote its union with hydrogen, the principal constituent of water .- See Davy's Ag. Chem. p. 283.

Caustic or quick-lime is extensively used in the arts, but I shall confine my present observations to some of its benefits in husbandry.

When lime, freshly burnt or slacked, is mixed with any moist fibrous vegetable matter, there is a strong action between the two, and they form a kind of compost together, of which a part is usually soluble in water. Lime thus renders matter which was before inert, nutritive to vegetables; and as charcoal and oxygen abound in all vegetable matters, quick lime is converted into mild lime by absorbing carbonic acid, which is their joint product .- Davy. Lime possesses the property of bastening the dissolution and putrefaction of all animal and vegetable matters, and of imparting to the soil the power of retaining a quantity of moisture necessary for the nourishment and vigorous growth of plants .- Parkes.

Mild lime, powdered lime stone, marles or chalks have no action of this kind upon vegeta. most moisture from the subsoil during the day, a little of this gum taken occasionally into the ble matter. By their action they prevent the too rapid decomposition of substances already dissolved; but they have no tendency to form soluble matters .- Davy. They are mechanically beneficial upon sands, in rendering them more firm and adhesive; and upon clays, in ren-

dering them less so.

food of vegetables being alike present) on its absorbent qualities; or the power which it possesses of retaining a quantity of moisture necessary for the nourishment and vigorous growth earths, in water, in vegetables, and is the basis of plants. When this power is great, Davy obof animal bones. It is combined with carbonic serves, the plant is supplied with moisture in ally increasing temperature of spring could comacid in common lime stone, chalk, marble, and dry seasons; and the effect of evaporation in the municate its genial warmth to the roots of vegvapour from the atmosphere, by the interior parts rior and the exterior during the night. This it is necessary to have the land open, that there shows the importance of keeping the soil loose, may be a free ingress of the warm air and tepid even in droughts, in order to render it permenble to the atmosphere and dews. Various soils dried at 112, were found by Davy, to acquire of burning. It thus becomes caustic or quick in an hour, by exposure to a moist air of 62° an increased weight of from 3 to 18 grains in pendent of it. Thus pulverization increases the 1000, in proportion to the vegetable and finely number of the fibrous roots or mouths of plants; divided matter contained in the different specimens-the absorption being greatest where these most prevailed. IMPROVEMENTS IN THE CONSTRUC-TION OF CHIMNIES.

Perhaps in the construction of a house, there is no part more difficult or liable to so many objections as the formation of the chimaies, nor is there any part in which impediments to comtert so frequently arise. There are a few who have not experienced the inconvenience ofsmoky chimnies, and who have not been put to serious expense-often meffectualty-to remedy the evil. We are glad, however, to find that a scientific man has turned his attention to the subject, and that efter various experiments, he has at length succeded in suggesting a plan by which all the imperfections hitherto known to exist may be completely obviated. This plan has been submitted to the judgement of some of the best practical architects of the day, and has received their unqualified approbation; and it is now applied not only to all the chimores erecting in the new palace in St. James' Park. but to the Post Office, and all other public buildings in progress. The public are indebted to Mr Hiort, the Chief Examiner in his Majesty's Office of Works, for this useful invention; and this gentleman has devoted much of his time, by evening lectures, to explain to builders the advantage and simplicity of his plan, which consists in the substitution of flues or tunnels of any diameter, capable of being incorporated within the usual thickness of wails, instead of the old plan of square flues. Each flue is surrounded in every direction, from top to bottom, by cavities commencing at the back of every fire place, and connected with each other. The air confined within these cavities is, by the heat of any one fire, rendered sufficiently warm to prevent condensation within all the flues contained in the same stock of chimnies; and what renders the new invention more important is the fact that the flues may be carried in any direction with as much facility as a leathern pipe, without in the slightest degree, deviating from the original circular form. It would be difficult, by mere verbal description, to convey an ade-It must be seen, that attention to this object quate idea of the whole of the plan; but it is rs, would fatten a thousand head of neat cattle. would open to our farmers a new field of euter- capable of being made clear to the commonest 'dea that their marshes are worthless, may prise and profit; and instead of drawing our capacity by a few minutes' instruction. NEW ENGLAND FARMER.

FRIDAY, MAY 5, 1826.

Steeping Seed Corn, &c .- Seed corn is commonly soaked previous to planting, for two purposes, to preserve it from birds and insects, and to accelerate its growth. In many cases, the soaking of seed corn is undoubtedly useful, but sometimes it is said to be kest to plant it dry. If the corn is soaked and cold wet weather follows, it is more liable to rot in the ground without vegetating, than when planted dry. Dr Deane observed that steeping seed corn, in general. had better be omitted. But " if planting a second time should become necessary, by means of the destruction of the first seed; or if planting be delayed on any account till the beginning of June, then it will be proper that the seed should have horling water poured upon it. Let it not soak more than half a minute, and be cooled speedily, and planted before it dries. The corn will be forwarded in growth several days."

A solution of copperas is recommended as a proper liquid for the preparation of seed corn, by a correspondent, whose communication we published page 284 of the current volume of the New England Farmer. Judge Buzz of Albany, in treating of the culture of this grain, observes that " Failures and great inconvenience and loss often result from the seed not vegetating,-from its destruction by the wire worm and grub,-and from the depredations committed upon the young

the liquor is yet warm. Thirty six hours is the The advantages which are secured by this longest period it should be suffered to steep, as plan are-first, the certainty of a quick and the nitre may destroy the vegetating principle uninterrupted draft; secondly, the prevention of the grain. As a further precaution, the liquor of an accumulation of soot; thirdly, the im- is again warmed, and a gill of tar stirred in, and possibility of accident by fire; and fourthly and the seed again immersed in it anew. Thus preabove all, a facility of cleansing by machines, pared, I have not lost twenty hills in four years, which will altogether supersede the painful The germinating process commences before necessity of employing climbing boys. Another the corn is planted, and unless the ground is too advantage is also gained with respect to the wet to grow this crop, (and it never pays the expense of culture on soils that abound in springs The present unseemly shafts, which are fre or that are naturally cold,) it will continue to progress. The hellebore is poisonous, and tho' pensed with and the tops or terminations of the the ground may partially extract the poison, chimnies completely hidden from view. We neither birds nor squirrels will ever disturb a haveseen a model and drawing of the plans, which dozen hills. The tar impregnates the seed, and at once exhibit the simplicity of the invention; protects it from the worms. The natre and and the only surprise is, that so valuable an im- plaster, with which latter the seed is mixed beprovement in the art of building should so long fore planting, combine their fertilizing properties to give vigour and strength to the young

Dr Mease observes that " a gentleman of Philof the patentee to supply; but arrangements are adelphia county, had his seed corn soaked in the making which it is hoped will enable builders black water of a dung heap, and in which some saltpetre was dissolved; when planting he added may be proper to add, that the principle is ca |a small handful of gypsum to each bill, when up pable of being applied to the tops and bottoms he put on a little more, and when the cors were were about to set, a small quantity was again added. His crop was very abundant, as we witnessed; and was the more remarkable, as the field had been worn out by bad management .-In rich ground, however, the application of all these strong stimulants may prove injurious, by causing too great a growth of the stalk. The second application of the gypsum may in such cases be omitted."

Some scientific writers condemn the use of steeps for seed corn, and assert that they are generally useless and sometimes injurious. But as preservatives against birds and worms steeps of acrid and poisonous substances, may no doubt; be of use; and in planting a dry and poor soil it that the nutriment which can be imbibed from in quantity, but it may supply the young plants at a critical moment, before the absorbent vesof the way of those insects which prey upon the

work is accomplished by the aid of bricks of a suffered in either of these respects I will state before the corn is up. But it is commonly designed to answer chiefly as a top dressing; and for this purpose it would answer better near the third hoeing; for then the plants want the greatest degree of nourishment, as they begin to grow very rapidly. Two dressings with ashes to answer the two purposes would not be amiss,"

> Ringbone in Horses .- A gentleman assures us that the cause of Ringbone in horses is a small collection of water in the foot just above the hoof. He says the fluid substance may be felt by pressing the part affected with the fingers, and its situation thus ascertained. A little bag or vessel like a bladder, contains the matter, which causes the disorder, and may easily be cut out, the horse being first cast to ensure the safety of the operator. As the ringbone has runed many valuable horses, and is generally thought to be often incurable, this discovery must be very important, if there is no mistake connected with it. The intelligence and respectability of our informant induce us to place confidence in his communication; though we think if remarkable that the cause of so common a disorder should not long since have been pointed out by professors of the art of Farriery.

Transplanting Peach Trees .- A horticulturist informs us that he has lost several peach trees in consequence of the decay of the tap root. In transplanting, the tap root is usually, and properly cut off, but is liable to decay, and the tree eventually to become hollow from the wound inflicted in taking off this root. He says that when the tap root or any other root of any considerable size is shortened, a composition should be applied to the wound; and that he has found equal parts of tar and yellow othre an effectual application for this purpose. Any other composition which is proper for pruning or grafting trees will answer for this purpose.

New and valuable application to Fruit Trees .-We have been assured by a gentleman who has experienced its effects, that potash dissolved in water makes an excellent wash for fruit trees. The proportions, which our informant recommends, are one pound of potash to three pints of rain water. The wash to be applied by a swab, to the trunk and limbs of the tree the latter part of May, or beginning of June, and soon after pruning. We are told that this application was may be of advantage to soak seed in some liquid first introduced in Mediord, Mass, by the late which will hasten their germination. It is true Gov. Brooks, the summer before his decease; who believed that it not only greatly acceleratsteeps by the vessels of seed corn is but trifling ed the growth of the trees, but was an effectual preservative against the Borer. One application is sufficient for a season. The wash is so corsels of the radicles can operate, by giving the rosive that it will soon destroy a brush, made of germ and seedling an early impulse, may cause hog's bristles, whence a swab is preferred for it to be more forward, and thus get the sooner out applying it. This mode of treating fruit trees also destroys the bark louse, and is said to give plants above ground, while vegetation is feeble the trees apparent health and vigor, in a much and the shoots, &c. tender. Steeping seed corn greater degree than lime, soft soap, Forsyth's can have but little effect against the cut worm, composition, or any other of the paints or washwhich does not injure the seed, but attacks and es commonly used for similar purposes. Whetheats off the plant soon after it comes up, just heliant soon after it comes up, just heliant soon after it comes up, just heliant sounds of the ground. Dr Deane says the trees, can only be ascertained by time and A handful of ashes on each hill will nourish further experiments. If any injury to the trees the plants, and have a tendency to prevent their is apprehended from the corrosive quality of being annoyed by worms. Some lay it on just the liquid recommended, it may be well to inplants by birds and squirrels. As I have never a better effect in preventing worms, if laid on quarts or more to a pound of potash. before the first, or second hoeing. It will have crease the proportion of the water; say two

RWRR

Improvement in the construction of Railways .-We have seen a model of an improvement in Rail Ways invented by Mess. John Brown and George W. Roeinson of Providence, which, it appears to us, will prove of very great utility. It consists in raising and lowering loaded teams by a balance and lever power, similar to a scale beam. The carriages running on these railways will proceed on perfect levels, except at certain places or platforms, in which by the operation of levers and weights, the carriages, &c. are raised or lowered, as the case may require, from one level to another. This is effected in one or two minutes, by a simple places on the minute of the man can conventently ing less strength than one man can conventently New England, consisting in part of the care of the man can be strengthed in the care of the man can be strengthed in the care of the care of the man can be strengthed in the care of the car

The same gentlemen have likewise invented an improvement, by which carriages travelling in opposite directions, can pass each other on Railways, with facility and with but little delay or trouble. Models of these inventions may be seen at the Agricultural Repository of Mr J. R. Newell, 108 State Street.

To Readers and Correspondents.-We have or afamong which are an elaborate Essay and vines the the cause of the disease. HORTICULTURE.

BLIGHT IN PEAR TREES.

We publish the following with pleasure and entertain a hope, accompanied with scarcely a shadow of doubt, that our respected correspondent has ascertained the cause and pointed out a remedy for one of the most serious evils which the orchardist has to encounter.

pear trees has frequently been a subject of inquiry; but as yet ! believe nothing has been satisfactorily determined. This disease is quite common in the neighbourhood of Boston, as I learn from gentlemen residing in the vicinity, as well as from the speculations which have appeared in the New horticulturists. This disease is well known to afgreat cities in England.

the observations I have made during the last four order to produce the best results. years, that every tree which bore large quantities of fruit was more or less blighted; while other trees of the same kind of fruit, of the same age, and standing in the same ground, but moderate hearers, were not affected by this disease. Last year I observed that a tree of the pound pear kind liad one of its largest branches so completely filled blighted. The leaves appeared to have been burnt. and the bark was decayed and dried up, presenting the usual appearance of blighted trees. I examined another tree in the same orchard, having a single branch blighted, which last year was overloaded with fruit. The other branches were in a vigorous state.

I was led to conjecture the cause of this disease, from observing the effects of overbearing on a single branch of a Baldwin apple tree. This branch was so completely filled with fruit, that the apples touched each other from the insertion of the branch to its extremity. I fied it up to the other branches of the tree, and it ripened all its fruit. The next spring it put forth its leaves, and flourished till the middle of July, when it was suddenly blighted .the branch presenting the appearance of having been burnt. This year it is dead.

The reason, I conceive, why pear trees are more subject to blight in a well cultivated and rich soil is, that they are forced to a higher state of vigor than trees standing on a poor soil or in grass land. is a mistake. Solar heat is more frequently inju-After a year or two of rich culture, they become rious than advantageous to such plants; it dries exceedingly vigorous, make a great proportion of the circumambient atmosphere to a degree which wood, and form numerous fruit spurs; and then, cannot fail to prove highly prejudicial to most ara favourable year occurring, they are overloaded borescent plants. The best station which can be with fruit. The maturity of this great quantity of pointed out for a tree which is to be acclimatize. fruit checks the growth of the tree, exhausts it, is in a sheltered garden, where it is well protectand destroys the vegetative principle. It is well known that an arrile tree decorticated in the win-face the north-west, and be so much shaded from ter will put for the leaves and blossoons in the succeeding spring, and even bring its fruit to man.

The succeeding spring, and even bring its fruit to man.

turity; but by this time it is exhausted, and at may not be excited into early vegetation. In such this stage of the process, the whole dies. The a spot the Mountain Poony, Scarlet Nipal Rhooverbearing of a pear tree seems to exhaust the dodendron, and similar plants, survived the last vegetative principle is ripening its great burthen, winter; while in most places, differently situated, yet it may throw out its leaves in the succeeding they have been wholly destroyed. spring, and continue to flourish till the time the sap ceases to flow in summer, and then die. If overbearing be the cause of the fire blight, the obvious preventive is, to thin off the fruit wherever it favourable notices of the products and the prosshall appear to be too much for the tree to hear; pects of the season, as at the present time. The Mr FESSENDEN, The cause of the blight on and this will depend upon the vigor of the tree, the papers from Maine to Georgia are teening with richness of the soil, and upon other circumstances, the fruitful theme, and grass and grain, pumpkins of which the horticulturist must judge. The over- and potatoes, corn, cotton and cabbages, are debearing of the peach tree and grape vine is equal- clared from all quarters, as with one voice, to have ly fatal to them, as to apple trees.

Upon stating my conjecture to Mr M'Guire, the head gardener of ELIAS H. DERRY, Esq. of Salem, England Farmer, by some of our most scientific I was happy to find it corroborated by his own observations in a great number of instances, and he feet the pear orchards in the vicinity of New York, declared to me his perfect conviction that this was Philadelphia, and also in the neighborhood of the the cause of the disease. That Nature, when "let alone," will "regulate herself," is true; but she It most commonly attacks trees standing in well will not regulate herself according to the purposes cultivated and rich soils. In this, I apprehend, lies of man. It is necessary in horticultural as in pothe first cause of the disease. I have found from litical economy, to apply the restrictive system, in

Salem, July 24, 1827.

STRAWBERRIES.

It is stated in the Gardener's Magazine, that John Williams of Pitmaston, near Worcester, cultivates strawberries on small ridges of earth running north and south, about nine inches above the with fruit, that three props were placed under it to level of the ground, planting the strawberries on prevent its breaking down. A few days since I the top, and laying plain tiles on each side of the examined this tree, and found that identical branch ridge. He finds the produce earlier, more abundant, and better flavored, than on plants grown on the flat ground. The flat tiles retain the moisture. promote the ripening of the fruit, and keep it free from dirt after heavy showers of rain.

WHITE MULBERRY.

It is suggested in the American Farmer that it would be well if Editors of papers throughout the country weuld suggest the expediency of gathering white mulberries, wherever they are to be had, and drying them for the sake of their seed. He who thus lays a foundation for a nursery of young mulberry trees will not fail to find an adequate demand for them.

SHELTERING TREES. *

Nothing is more common than to select for the reception of a delicate tree in the open air, a warm south border, fully exposed to the daily influence of the sun; it being believed that the chief difficulty in preserving what are called half hardy trees, arises from a deficiency of solar heat. This

THE SEASON.

We do not remember to have ever seen so man; been "nev r more prosperous." In our own neighborhood, the Lynn paper declares that the season, thus far, has been most propitious. Haying-time is nearly over, with farmers in this neighborhood; and the abundance which has crowned their labors, is such as demands our liveliest gratitude to the Author of all Blessings. So great crops of hay have not been known for many years Some of the farmers have cut from two to three tons per acre. We have been visited with copious showers and sunshine, and the early and latter rain have come in their season. Fruit is not expected to be very plenty; but the luxuriant fields of corn look beautiful, and promise a rich [Salem Gaz.] harvest.

AMERICAN INGENUITY.

Mr Jacob Perkins has been engaged by the French Government to build steam artillery. A piece of ordnance is to throw sixty balls of four pounds each in a migute, with the correctness of a rifle musket. A musket is to be attached to the steam generator, for discharging a stream of lead from the bason of a fort. It is to throw from one hundred to a thousand bullets in a minute, as occasion may require. A series of satis factory experiments has taken place at Green wich, attended by the French Engineers appoint ed for the purpose by the Duke d'Angouleme. with one of his aids, and Prince Polignac. Lord Wellington remarked, that a country defended by this kind of artillery, would never be invaded. Lord Exmouth, after witnessing a few showers of lead, said he believed the time would come when a steam gun boat, with two large guns in her bow, would conquer any line of battle ship; and Sir G Cockburn said, the mischief of it was, it would be to nations what the sword and pistol was to duellists-it would bring strong and weak on a level .- [London paper.

SOWING GRAMS

An English farmer, impressed with the idea that a better rule might be obtained for sowing the various species of grain, than what could be regulated by the calendar, determined to make minutes of his own periods of sowing as they were in coincidence with the blossoms of well known trees: or on the return of various birds of passage, with the earliest voice or song of these, or such as were stationary in the country. The following is the result of his observations for a series of years :--

Peas and spring vetches .- As early as the lark

shed their farina.

Barley .- At the earliest discovery of the cuckoo, and the white-swoln buds of the blackthorn.

Cabbage and Turnip-rooted Cabbage .- At the appearance of the hyacinth (blue-bell) and when the ring-dove (wood pigeon) begins to coo.

Potatoes .- When the wilding or crab apple is in bloom; and perhaps the true period of taking them up is at the dropping of its fruit.

Turnips .- When the elder flowers, and electrics ripen.

Wheat .- At the fall of the aspen leaf, or when the grey or Royston crows return; but these being only local visitants, most of the inhabitants in several counties not being acquainted with them, the woods.

This theory of sowing has been suggested by two distinguished naturalists, viz. Dr. Stillingfleet, in his "History of Animated Nature."

From the American Farmer.

At the close of a collation in the Hall of the State-house, at Boston, on the 4th inst. a number of toasts were drunk by the Governor and other distinguished men of the state; and, amongst others, the fellowing-

By the Sheriff of Suffolk. Our Territory-Coexisting with our agriculture and civilization:

Far be from us the undelightful pride Of nerveless empire, cultureless and wide. Young men, forbear o'er distant wilds to roam In search of comfort, better found near home. Rouse to fertility, by skilful toil, Each dormant acre of your native soil; and, more than riches, covet the applause Offaithful subjects to benignant laws. So shall your sires, withdrawing from life's race, Joy to behold you well supply their place; So shall your country, happier for your birth, With strength unshaken, hold her rank on earth. For centuries stand; and brightening honor gain, More from her children than her vast domain.

On the above, a friend who sent it to us remarks, that,-" this toast by the sheriff of Suffolk, Charles Pinckney Sumner Esq. deserves a place in the American Farmer, and ought to be conspicuously suspended in every mansion and leg cabin in the United States and territories attached to them"-and we heartily unite in the sentiment.

Instead, however of bringing up their sons to pursue this judicious course, on which the salvation of the state depends, it has been the universal practice of parents to encourage them to flock to the towns-there to get into the stores, and lawyers' and doctors' shops; or to send them to West Point, or in the navy: in short, any thing ruther the army, there are ten thousand !! than teach them to take the plough by the handles, and submit with a good grace to the will of their brow.

When regarded with just discrimination, can there be any station in life more truly honourable than that of him who practices the utmost economy and cleanliness in clothing and diet; and who is not deterred by laziness or false pride, from having been first enlightened by a good solid ed-

Oats .- When rooks begin to build, and the the moral duties that belong to his social condition, growth of regions and modes of culture, mortal in male blossoms (catkins) of the hazel expand and and to appreciate the political blessings of his their effects upon the health of adult white setcountry?

In that portion of the United States which is most highly cultivated, where few hold large landed possessions, but where all are independent; where every comfort abounds, and gaming and drunkenness are alike unknown-every man takes his share of labour. Judges and governors, and members of Congress are not ashamed to be seen in their working frock and trowsers; and better general revered mere in the field, and less in our cups.

Be assured, young men, to this honorable destiny you must come at last, willing or not willing. of the laboring agriculturist.

" Ilis habit pure, with plain and temperate meals, Robust with labour, and by custom steel'd

To every casualty of varied life."

In regard to the medical profession, there are already almost as many students as there are various drugs to be compounded; and doctors so numernus, that were every man in the nation on his back, he might be "helped to his grave" as speedily as in the days of Sangrado himself-as lancets are equally sharp and calomel is quite as potent as hot water. Lawyers are swarming like locusts o'er the land, and "dream of fees" more than they ever get; measurers of tape and calico are as thick as bees in a pot of honey. The midshipmen are all over every ship, and for application, for the military academy, the only avenue to

But, say our young friends, can we not escape the odious drudgery of manual labour, by migrat-Creator-that man shall live by the sweat of his ing with a few slaves to some new country, whose virgin soil, teeming with fertility, asks only to have the seed sprinkled on its bosom, to make returns beyond measure? No; we say again-

> "Rouse to fertility, by skillful toil, Each dormant acre of your natire soil."

The products of those states in which you are wielding the axe or guiding the plough, -his mind allowed to carry slaves, will scarcely pay all execation, and in that manner qualified to understand except, perhaps, sugar and rice, which are the show the operation of this ca

To arrest at least, in a great degree, the course of deterioration under which the middle and southern states are sinking in respect to population and social comforts, a few things appear to be necessary, and these are happily within the reach of the rising generation of young men. The first is. to shake off, as inglorious and disreputable, the habits of idle consumers, drenes in the hive; and would it be for us, were the example of the Roman fall to work as industrious producers—active bees; each gathering more honey, be it ever so little more, than he eats. Let every one firmly resolve to lop off every superfluous expense in dict, drink, clothing, equipage, servants, and furniture, and It is the irresistible tendency of our institutions to make it a point of honour to set an example, in his their return is in correspondence with the latest erumble up all large estates into small ones, and own person, of regular industry. Your idle comfall of the acorn and the variegated appearance of to bring the whole population to that condition in panions, who murder time in whiskey stores, and which fortunes must all be very moderate, and village card and billiard tables, may sneer for a nearly equal, and in which each member of socie-time at your early rising, your homespun coat, ty will have to perform his portion of the manual your frugal meal, your rough hand, your sun-burnt his "Calendar of Flora," and Dr. Goldsmith, in labour necessary for the support of all. NEW-YORK CANALS.

When the New-York Canal was undertaken, there were not wanting persons to scoff at the idea of its being a practical project. Nothing would convince these gainsayers, but the palpable demonstration of seeing and feeling. Boats of all burthens, we believe, as high as an hundred tons, move up the country to lake Champlain, and bring messages from the Nereids of the blue wave to the Naiads of the pellucid fountains, that dash amidst the dark forests of the Green Mountains .-Boats move over the rapid Mohawk, as he foams along in his deep and slaty channel below the calm and sleeping waters of an artificial river in the air. Along the whole course of this canal, large and respectable towns, with their bustle, and their massive buildings, and their city show, and numerous villages, that, twenty years ago would have been called towns, spring up, like the prophet's gourd, and seem to have been transported there by the power of enchantment. A single and isolated fact, and one far from the orpenses of cultivation and transportation to market; dinary samples of demonstration, is sufficient to As we looked

on the bustle on a wharf, in the harbor of New-York, we saw large, knotty, and unsightly logs, apparently of a weight to sink in the water, loading on board a large ship, bound for London .-We were told these logs were cut near the shores of Ontario. They were of the class called bird's eye maple, and were intended to make cabinet furniture for the citizens of that luxurious metropolis, who wanted a wood less common and rulgar than mahogany. Before the canal existed, one of them could not have been transported from Ontario to New-York for twenty times its value. It is only since the New-York canal, that the name 'Genesce floor' was known east of New-York, It is now the principal kind used.

CANALS IN CHINA.

To abridge the labor, expense and difficulty of transport was a project, naturally connected with observing the vast improvements of labor-saving machinery. That sagacious and tranquil people, the Chinese, on both the subjects have been accomulating the fruits of an hundred generations .-Canals with them are almost as ancient as their history. It is believed, that the length of all the navigable canals in that vast empire, cast into one sum, would make a total of some thousands of miles. More than a million of people constantly reside upon them. Transports and passage are performed with astonishing ease and cheapness. From these and other causes, "every rood maintains its man." A very striking representation of Chinese management, in these respects, was presented in a Chinese engraving. It showed a woman, guiding rapidly along a canal, a boat of ten tons burthen. She carried a babe, appended to her back, after the fashion of our Indians. She rowed the boat with her feet, having an our after the fashion of the country, fastened to each foot. She managed the sail with a cord attached to its triangular point with one hand. With the other she held the rudder; and thus occupied, transported a load, which, to have been carried on the land, would have required ten teams, and as many drivers to do it.

HESSIANS.

An American gentleman travelling in Europe lately visited the duchy of Hesse Cassel, that country from which thousands of soldiers were hired by the British government in 1776, to fight the liberties of America. He found the population so burdened and oppressed that it seemed "as if the last ounce only was wanting to make Mexico, which appeared to them only as a speck. The population of the rest of Attica amounted to them sink." Hesse is an open country, destitute of enclosures, and negligently cultivated.

Mr. Russell, in his "Tour in Germany," says the Hessian peasantry are chiefly hereditary tenants, who have one way to do a thing, and never think of looking about for another. They wear low crowned hats with an immense brim, and allow their shaggy locks to grow unshorn, and to seek their tangled way down the back. Their dwellings are dark, smoky, dirty hovels. Crowds of begging children surround the traveller at every stage. The late elector left behind him 40 illegitimate children, and 40 millions of rix dollars. The foundation of his wealth was laid by his father, in hiring out his troops to England, for the American war .- Hamp. Gazette.

The Pottsville (Pa.) Journal notices the discovery lately of thirty-four new beds of coal, of from three to six feet in thickness.

From the Hampshire Gazette.

VOLCANO.

tain, this is the only one that has succeeded .-The party left the city May 15th, and on the 19th; reached the height of 12,541 feet above the level of the sea, where they passed the night. On the 20th they mounted their mules, and soon passed the bounds of all vegetation, and entered upon a region so stony and precipitous that they were obliged to abandon their mules and proceed on foot. The difficulties of the ascent increased as they advanced-there was no bush or shrub by which they might support themselves, and the stones upon which they stepped frequently rolled from under them, and went thundering down the sides of the mountain, endangering the lives of those who might happen to be below. Their Indian servants became so terrified that nothing could induce them to continue farther; they returned to the place where they had passed the preceding night. The rest of the party clambered from rock to rock, encountering many difficulties and dangers, until they suddenly discovered the object of their labors and sufferings. They had passed the day in profound solitade without seeing a plant, bird or insect in the midst of broken rocks, and horrible precipices; experiencing severe pains in the head and knees, a difficulty of breathing, and a disposition to vomit. They found the crater to be nearly circular and about a mile in circumference; the shape like that of a tunnel, and the depth immense. The spectacle was awful and appalling .-The cruptions were almost uninterrupted, casting up showers of stones, which fell back within the crater, excepting a small number which fell outside of the opening, and send forth clouds of ashes and smoke. The noise of the eruptions was like thunder, and rose and subsided like the roaring of the sea. Having completed their observations, they retraced their steps, and about night came to the limits of vegetation. The highest point to which they attained was 17,885 feet, (almost 3 1-2 miles) above the level of the sea. On account of clouds, they could see nothing from the top but the summits of Orizaba and Sierra. At the height of 16,893 feet they beheld the city of inhabitants, of whom 20,000 only were citizens.-

DEATH BY POISON.

Died, in Sodbury, on Sunday last, Henry Moore. son of Mr. Lewis Moore, aged 6 years. llis death was caused by eating the seed of a poisonous weed known by the name of wild hemlock, which he mistook for caraway seed. He ate this seed on his way to school on Thursday and was seized in a few hoors with a severe pain in his bowels. and died on the third day afterward.

Wild Hemlock .- This noxious weed grows in all parts of New England, and is remarkably abundant in our vicinity. It is found chiefly in runs and wet grounds, but is sometimes seen by the road side, or by ditches and fences in dry places. The stalk is purple, except when it grows in a shade, then it is green; the plant is from two to five feet high. The blossoms are straw-colored or nearly white, are set in tufts or clusters at the end of the branches, like the blossoms of caraway, carrot, and parsnip. The seeds are a virulent poison; they very much resemble caraway seeds, and it requires close inspection to distinguish one from the other. It is a very common and beautiful weed; it may be seen in all our meadows and other wet mowing lands growing in luxuriant abundance, over-topping the uncut grass by nearly two feet, branching forth in quite a tree. Its blossoms begin to appear in June and are found through July and August .- Concord

It is stated by Col. Murray, in a speech hefore the convention at Albany, that the iron ore of this state may challenge a competition with the world. that the counties of Clinton and Essex manufacture about 2000 tons of bar iron annually, and furnish about 5 or 6000 tons of pig iron, that the fur naces for making the latter have almost suspended their operations.

FELLENBERG SCHOOL AT HOFWYL.

Extract of a letter from John Murray, Esq publications, adverted to the 'Annales Agricoles de Roville,' as containing an account of the very interesting establishment of M. Fellenberg at Hofwyl. As I visited these magnificent arrangements on the 26th August, 1825, perhaps a succinct notice may not be uninteresting. I am onwilling, however, to trespass on your valuable pages further than to give a very summary account of what I personally witnessed; especially as there are numerous publications filled with details of these peaceful and interesting scenes.

"The agricultural implements, which are enpreserved in shallow trays of wood, in subterranean cellars, and the floors frequently sprinkled with water, to keep them cool. There are fifty milch cows, which are regularly curried down and dressed like horses, fourteen borses, and fourteen oxen for labour, which are particularly large, of the Fribourg breed. Liquid manure is duly ap-

the pupils had set out on their annual pedestrian excursion, via Neufchatel, under the care of one of the classic tutors. We were informed that there were then ninety-nine scholars. Of these afteen were English, ten Scotch, including two sons of the eccentric Mr Owen, who had twice visited Hofwyl, two Russians, one Greek, several Danes, Swedes, and Germans; the rest French and Swiss. There were, of course, no Spaniards. Twenty-one masters teach the languages, belles lettres, arithmetic, natural philosophy, chemistry, botany, agriculture, &c. There are five professors for the various accomplishments, as music. drawing, &c. In the saloon for music we noticed two kettle-drums, a grand piano-forte, &c.; and on a large black board were chalked lines and notes, for the use of beginners. They have a method; in fact, nothing can be well conceived extraordinary establishment. There is a chapel that serves at once for Protestant and Catholic view, being shut up in a convenient case.

"The beds where the pupils repose are elegantly neat, and all subordinated to health and comfort : each insulated compartment has its corresponding closet. In the salle a manger, or dining room, is a closet which descends, by means of machinery, into the kitchen beneath, and is wound op again loaded with its covers. Even in the kitchen for the working people we noticed a Papin's digester. Proper houses and rooms are appropriated for tailors, shoemakers, &c.; and we found the carpenters and mechanics at their respective labours. The children of the poor have gratuitous instruction. A large building is appropriated to horsemanship and various gymnas-

TO DESTROY COCKROACHES.

MR SKINNER-I have seen one or two articles in the Farmer, describing ways to destroy eockroaches-they may all be good; but as there will be no harm in multiplying facts, and shewing various ways for obtaining the same results, I will trouble you with my method, which I know by experience to be effectual.

Several years ago, I entered upon the possession of a large old house that had been for some months unoccupied, and I found it swarming with cockroaches. They devoured such clothing as fell in their way, and were in other respects very troublesome and disagreeable. A neighbor kindly suggested a plan for destroying them, which I adopted as follows:

I set two trocks, or earthen pots, each ten or twelve inches high, and about the same in diamcter, in the two most infested parts of the house, into which I put a few gills of molasses-against these I leaned shingles, making a bridge from the floor to the rim, that the vermin might easily reach the luscious bait below, whose fragrance filled the chambers; and the better to allure them, I trailed some molasses along the road I intended they should travel to their prisons, and which they did travel in such numbers the first night, that I found the crocks half filled: the second night completed their capture and destruction.

Am. Farmer.

CROPS IN NOVA SCOTIA.

The Editor of this paper having returned from a journey through a large part of the Province of New Brunswick, Prince Edward's Island and the eastern part of this Province has had an opportunity of collecting information as to the state of the crops. It was represented to him, wherever he went, that the season has been in the highest degree favorable to the hopes of the farmer .--Genial showers have been succeeded by dry sultry weather; and the soil has thus been kept in that state of moisture which is best adapted for the full development of its vegetative powers. It is generally thought that there has been no prospect, equal to the present, for these ten years back. The crops of hay are unusually heavythe grain is strong and verdant-Indian corn vigorous-and the potatoe overy where setting up a thick and bushy stem. The general appearance not be destroyed by the modes of cultivation, genof the country is rich and beautiful.

Halifax Novascotian.

Washing Machine .- The New Brunswick Times calls the attention of the publick to a Washing Machine exhibiting in that city, by Philip P.Crain. If it deserves the recommendation there given, it is a valuable invention. The editor says it is simple in its construction, is worked with little labour, and does the washing in the best manner, and with less injury to the finest garments than the ordinary mode. It is calculated that a woman will do more washing in two hours than can be performed in a day by the common process.

Middletown, Conn. on the 12th inst. at which it proves their texture, and causes them to be more of coals. NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 27, 1827.

PARING AND EURNING THE SOIL.

Paring and burning is the process of paring off the surface of lands, and preparing the soil, by means of fire for arable crops. It is more particularly adapted to the improvement of soils which are overrun by the roots of vegetables that canvery useful in many soils. There has been a difavorable circumstances might have been converted into food for plants. But it often happens that there exists in a field an excess of vegetable mstter, which is scarcely possible to decompose with-

made by speculative chemists to paring and burning, is, that the animal and vegetable matter in Horse Chesnuts .- A permanent buff, or nan- the soil is diminished :- But where the texture keen die, for muslin, linen, cotton, silk, or woollen of the earthy ingredients is permanently improved, there is more than a compensation. To meet the objection still more directly, where an excess of inert vegetable matter is present, the destructo cold soft water, with as much soap as will just tion of a part of it must be beneficial; and the cloud or discolour the water. When deep enough, carbonaceous matter in the ashes may be more useful to the crop, than the unreduced vegetable fibre, of which it is the remains, could have been. "The most speedy way of bringing under tilor break them small; steep them in soft water, lage a meadow overrun with rushes, is; first to with soap as above, and die in the same manner. drain it, and then to pare off a thick turf and burn

> "The cases in which burning must incontestater; here it can only be destructive; for it decomposes that constituent which is already below the minimum proportion, and in the presence of which, in a limited degree, the productiveness of a soil depends."

The late Mr Nicholson of New York, in a prize essay, appended to The Farmer's Assistant, thus describes the operation of paring and burning .-When the ground is in a good sward of grass let irons of which should be well sharpened. Let the plough run about three inches deep. Then cross plough with a sharp coulter, and the sward will all be cut into squares of ten or twelve inches .-Set these square chunks up edgeways, by leaning two together, and they will soon dry. When well dried, build a part of them up in the form of little ovens, at the distance of about eighteen feet each way. These are to have a little opening or door. at a common windward side, for the air to enter and another opening above, for the smoke to pass off. On some dry day, when the wind is fair for blowing into the holes below, place some straw or other dry rubbish into the holes, and set fire to erally made use of; and to stiff clays, which by it. As soon as the fires have got fully going in being burnt are converted into a kind of manure each of the heaps, let the holes in the tops be stopped up, for the purpose of retaining the smoke versity of opinion among agriculturists respecting and keep gradually building up the heaps as the the propriety of making use of this process to sub- fire penetrates them, until all the chunks of earth due a refractory soil. Burning soils no doubt are piled round them; and when the heaps have may destroy much vegetable matter, which under fully burned and sufficiently cooled they are to be evenly spread over the ground, and ploughed."

The following is Mr Cobbett's method of burning earth : " Make a circle or an oblong square, cut sods and build a wall all round three feet out great expense and delay, in such a manner thick and four feet high, then light a fire in the that it can furnish nutriment to plants, except by middle with straw, dry sticks, &c. extending it all the agency of fire. Burning, likewise, renders over the bottom of the pit; keep adding light fuel Connecticut .- A State Convention was held at clays less coherent, and in this way greatly im at first, then rubbish wood, till there is a good bed M. L. Scovill, Calvin Goddard, Thomas S. Perkins, water from the atmosphere is diminished in the The ashes for torrefied earth) will be cool enough

and lay on dry soils as at first, and when the whole is under good way, throw on the earth, (subsoil, &c.) torrefied, till the heap is sufficiently This manure applied to cabbages, ruta effect."

It will be observed that Mr Cobbett's directions the soil, but for burning earth, including subsoil, to any convenient depth for manure. If the subsoil is wholly, or in part, clay, or, perhaps, any other species of earth, in which there is but little silicious sand, it may, in many cases, be expedient to dry it and burn it for manure.

It is observed by the Rev. Mr CARTWRIGHT, an English writer on agriculture, that in performing to do it with a smothering heat; for if the fires are too intense, the ashes will be of an inferior quality. The advantages of this practice are numerous; for it in a great measure annihilates seed weeds: it is destructive to many kinds of insects and other vermin, noxious to agriculture; it decomposes whatever comes within the sphere of its activity; and the ashes it produces neutralize the soil, and assist in the further decomposition of the vegetable and animal matters contained in it; and these substances it converts into suitable food for future crops. Its operation on the soil is something like the operation of malting on grain causing it to part freely with its most nutritious principle, the saccharine matter; so will paring and burning dispose the soil profusely to part with its nutrition to the plants which are committed to it; and this it will do, not for a single year only, but for several years, according to the original degree of fertility, in succession; and if the crops are exhausting ones, till it is soon worn out. Hence on pared and burnt land, more so perhaps than on any other, no two exhausting crops should follow each other. By exhausting crops are understood. wheat, rye, barley, oats, and buckwheat; by fertilizing ones, crops of every kind which are consumed upon the land or mown, or carried off before they perfect their seed, and which are bro't back again in the state of manure."

It is stated in Young's Farmer's Calendar that Mr Ducket, a celebrated farmer in England made use of the following method of trying the heat of his hay stacks: "He thrust a scaffold bolt, cr other stout and long iron bolt into a stack, to give easy admission to a gun rod, with a strong worm at the end of it, with which he screws out a sample, and discovers not only the heat, but the colour of the hay; if the stack wants air, he makes many of these holes, which give vent to the heat, and answers the purpose of a chimney."

SOILING LABOURING OXEN AND HORSES.

Instead of turning your oxen and horses, which you have occasion to use frequently, into a large Kenrick, of Penobscot. pasture where it is almost as difficult to find them as it is to find out the longitude, and to take and

to remove in a week, peat or bog earth may be You must be careful that they have always water burnt in the same way or dry, as in the paring at hand, and plenty of litter to absorb the liquid and burning method. Some only kindle a fire and manure, unless you have reservoirs, &c. to answer the purpose of preventing its waste. Mr Young said that "Lucerne is the best plant for inhabitants, and Newport about 10,000. Hand soiling, and an acre of it will go much further than any thing else. But clover or any other Philadelphia. It is said there are 4000 at work baga, Indian corn and buck wheat produces great grass, green or dry, oats or Indian corn, cut upnear the roots, cabbages, &c. &c. may often be economically disposed of in feeding cattle and are intended not only for burning the surface of horses, whose services are requisite for the prosecution of the daily and hourly labours of the hos-

RHEUMATISM.

We are assured by a person who has experienced its effects, that the following is excellent for rheumatic complaints: spirits of hartshorn 1 oz. an oz. Mix, and apply with friction to the part the Ionian Islands, on the 5th of May, despatched the operations of burning " care should be taken affected. Bind on flannel to keep the part warm, and make use of the ointment morning and evening. The above ointment, says our informant, is likewise useful in sprains, and other cases in which opodeldoc is recommended.

CURE FOR THE RING WORM.

A friend in Charlestown has given us the following recipe, which he says he has known to effect a cure of the ring worm in very obstinate cases :- Take a half pint tumbler, and fill it nearly full of strong vinegar-then put in a new laid egg, (the newer the better)-let the egg remain a few days till the vinegar eats the shell entirely off-then throw away the egg, and apply the vinegar, thus prepared, to the part affected, once a day, for a week or ten days, which will effect a cure. During the application, it is necessary to keep the bowels open, by salts or some gentle medicine.

pleased to learn that a translation of the valuable complaining of the importation of foreign wool .and interesting documents relative to the first The petition was supported by the earl of Malmsvoyage of Columbus, is in progress, in Boston, and bury, who stated that during the last three years. the printing of the work commenced. The origin- the quantity of foreign wool imported was \$2,308,als of these documents were discovered in 1789, 000 pounds, of which 51,412,000 pounds were from among the archives of the Duke del Infantado. — Germany. The consequence was that British They were not published until a year or two wool had fallen from 22d (40 cents) to 9d (17 to be an abstract of the original journal of Colum- effect, but quite the reverse. "If we impose a sea, and is probably more interesting from not and thereby reduce the price of our own wool." being elaborated. Its authenticity is said to be He said the best remedy was to establish markets unquestionable.

The following gentlemen have been chosen delegates to represent Maine in the General Convention of Farmers and Manufacturers to be held at Harrisburgh, Penn. on the 30th inst. The Hon. John Holmes, of York. Wm. Ladd, Esq. of Cumberland, Gen. Joshna Wingate of Kennebec, Brice of. Lellan, Esq of Somerset, and Gen. Jedediah

[bid.]

It is not easy to perceive (says the Palladium) why a " Lace School," to employ profitably " 500 young ladies" might not flourish in Boston as well as Newport. The former has about 60,000 Looms might also be employed in Boston as well in the latter city in muslin weaving.

A London paper of June 8, states that the British Ambassador at Constantinople had sent a despatch, announcing the entire defeat of the Turks before Athens, on the 29th of April; loss said to be 10,000 men. Ratisbon letters of the 26th of May, confirm the above, and state that the Turks were successively driven from all their entrenchments, and forced to abandon all their artillery sweet oil ½ oz. laudanum ¼ of an oz. honey ¼ of and baggage. The Lords High Commissioners of a courier from Corfu to London with another confirmation of the above.

> A letter has been received in Richmond Va. giving the unwelcome intelligence that Mr Madison was taken extremely all with the cholera morbus in the night of the 11th, but that on the morning of the 12th he was better.

> Eggs .- Mr Loudon says that if eggs are left unmoved for some time the yolks subside, and come at length to touch the shells on the lower side, when rottenness immediately commences .-In some parts of England, they hang up eggs in nets and turn them every day, to prevent the yolk's coming to the shell; in others, they anoint them with melted mutton suct, and set them on end in bran, the containing box being closely covered.

> > Hamp. Gazette.

Wool in England .- On the 7th of June, in the house of lords, the earl of Winchelsea presented First voyage of Columbus - The public will be a petition signed by upwards of 400 flock-masters. since, when they were given to the public by or- cents.) Lord Goderich said in reply that to ender of the present king of Spain. The manuscript courage the British wool-growers by a heavy duty is said to be in the hand writing of Las Casas, and on foreign wool, would not produce the desired bus, made by this author while compiling his his- duty on foreign wool, we shall lose a great share tory of the Indies. It is the form of a diary at of the trade in woollens with foreign countries,

> Currant Jelly .- There is a demand for this article in this place, and those who have an abundance of currants, will do well, perhaps, to pay some attention to it. It is made by mixing currant juice and sugar, and boiling them gently for two hours or more, and taking off the scum that arises. Some use one pound of brown sugar, to a quart of juice; others two pounds; and some two pounds of loaf sugar. The price depends on the richness and niceness of the jelly. It will probably bring from 50 to 75 cents per quart, if

for woollen goods on an extensive scale .- Ibid.

Bricks .- In the vicinity of London upwards of to 10 feet for brick earth. The bricks from an a-

The election of a representative in Congress in this city on the 23d inst. terminated in favor of Hon. BENJAMIN GORHAM. The votes were, Gor-

Onions .- Mr. William Simonds has raised in his garden in this city, an astonishing crop of onions, considering the number planted, and the ground occupied. In two bods, each of 10 1-2 feet long, and 3 feet wide, he planted, in the spring, 532 of the Egyptian onions, which propagate from the root, and bear no seed at the top .---From these, he pulled a few days since, 2,640 onions many of them of a very large size, each onion planted having a number of others from 3 to 15 clustered around the root, and almost all of them was awarded to Calvin Simmons, who cut 5864 large enough for the purpose of cooking. Sometimes as many as 18 have been produced from a single plant. The onions are of superior flavor, feet; swath 9 ft. 2 inches wide. The third (a hoe to almost any other of that class of esculents .--Trenton True American.

Remedies for the Tooth Ache .- Make a solution of Camphor and pulverised Cayenne pepper: dip therein a small quantity of raw cotton and apply it to the affected tooth, and it will give instant relief. To prevent the composition's getting to the throat, lay a bit of rag over the tooth for a few moments. [Wilmington Herald.]

2 drachms of alum reduced to an inpalpable powder, and 7 drachms of nitrous spirits of either, mixed and applied to the tooth, will prove effectual in 95 out of 100 cases.

Extraordinary Cow .- A Cow belonging to a gentleman in this town, yielded yesterday at a milking was at two o'clock P. M. after an abmilked again between 6 and 7 in the evening, and gave seven quarts more, making in all, upwards of six gallons of milk drawn from the same cow within the short space of five hours. [Hal. Adv.]

Remedy for Intemperance.-Messrs Reed & Howard, druggists, 44 Hanover-street, have prepared a medicine for the cure of Drunkenness, which has been fully tested by several respectable physicians of this city, and is found to possess all the qualities of Dr Chambers' composition.

Apricots, some of which measured seven inches round, have been taken from a tree in the rear of a gentleman's dwelling in Philadelphia.

Upwards of 30,000 hhds. of sugar, and 10,000 lihds. of molasses, were made in Louisana last sea-

It is reported that the Spanish minister has represented to our government, the irregular conduct of Com. Porter, in taking a station in a port in country.

Palm-leaf hats are now made, on an extensive scale, by Mr. Jabez Boyden, of Dedham, near Boston, Mass.

Fever and Ague .- Take 2 onnces of Peruvian 2000 acres have been dug to the depth of from 4 bark, 2 of powdered cloves, and I of cream of tartar; mix them together; divide the composition cre of brick-earth produce about 18,000 dollars; into 12 equal doses; and take one dose every and the sum paid to the owners of the soil is morning, noon, and night till the complaint is \$2200 per acre. An acre at 4 feet deep yields 4 checked; then one every morning till the whole millions of bricks. In the manufacture of bricks, is taken. Euch dose may be taken in a glass of the kingdom, and will be found at least, equal in point the earth is mixed with coal-ashes and sand .- Ib. any kind of spirituous liquor mixed with water .-Emporium.

Stirups and Bedsteads .- A Mr Powles of Philadelphia has invented a safety stirup to avoid the office of the auctioneers, at any time previous to the danger of having the foot caught when a person safe.

COOLIDGE, POOR & HEAD. ham 1659, Blake 698, Henshaw 459, Scattering danger of having the foot eaught when a person is thrown from his horse. He has also brought to perfection a bedstead, so arranged, that the sacking may be kept continually stretched and the the "red coats," those backbiting gentry that " murder sleep."

> Mowing .- At a mowing match on the 4th of July at Canandaigua, N. Y. 14 candidates catered for the 6 premiums to be awarded to the man who should out the most grass in the best manner, in one minute. The first (a fine scythe with snath) square feet; swath 9 feet 2 inches wide. The second (an axe) to John Kent, who cut 511 square to John Woby, a coloured man, who cut 546 square feet ; swath 9 feet wide. The ffth (a spade) to Elias Russell, who cut 557 square feet; swath 9 fect wide. The sixth (a shovel) to K. Murray, who cut 496 square feet; swath S feet wide. All the work was extremely well done. The premium articles were all of elegant workmanship,

Rait Roads-The Mass. Journal of the 19th inst. contains copies of a correspondence between Governor Lincoln and the Hon. James Barbour, Secretary of War. relative to the contemplated rail road from Boston to the Hudson. The object of Governor Lincoln was, to ascertain how far it was in the power or disposition of that Department, to aid in the necessary examination of the country of the proposed route, during the present season. Mr Barbour replied that all the officers under single milking, eighteen quarts of milk. This the control of his department for similar purposes, were already engaged for the whole season, and that sence in the pasture of about 18 hours. She was no co-operation could be expected from him. He considers the object of the contemplated undertaking of very great importance, and declares his readiness to co-operate in its execution whenever means will justi-[Portland Advertiser.]

> Marchioness of Wellesley .- We learn by the ship New-York, that this lady, (late Miss Caton of Baltimore,) left Dublin the latter end of April for London, where she still remains; and report says, for six months previous to her departure, she and the Marquis had not exchanged a word with each other, nor eat at the same table; this is an excellent episade to the loving letter he wrote to our Aldermen, a few months ago, acknowledging the receipt of the capal Medal, and the volume of its history. [Morning Chronicle.]

Indians .- It is almost as great a curiosity to see an Indian now a days in this quarter of our country, as it would be at Philadelphia. Not long since, four of these sons of the forest made their appearance, about twenty miles north-west of this place, and were observed to loiter about one particular farm for the most of a day, when they borrowed a spide; went into a corner of one of the farmer's fields, and dug up three or four small sized brass kettles, which must have been buried there long before the improvements were made. the United States, to annoy the commerce of his This done, they talked together for some time, pointed with their fingers in different directions, then hung the kettles on their backs, and walked quietly off towards the setting sun in Indian file .- Erie (Pa.) paper.

Saxony Sheep.

On Friday the 24th August next, at 3 o'clock P. M at Brighton near Boston, will be sold by public auction, a choice stock of about 100 Saxony Rams, just imported in the brig Comet, Capt. Meef, from Ham-

These sheep were selected from the purest blood inof fineness of fleece and symmetry of form to any heretofore imported. The sale will be perfectly free and untimited.

Samples of the wool from different parts of each an-

ROMAN. This elegant, full blooded horse, a bright bay, with black legs, mane and tail, of high spirit and good temper, will stand at the farm of Mr Stephen Williams in Northborough (Ms.) at \$20 the season, to joints so close as to afford no accommodation for be paid before the mares are taken away.—See New England Farmer, May 25.

Subscribers to the New England Farmer are informed that they can have their rolumes neatly half bound and lettered at 75 cents, wrich is as cheap as they can be done in this city-by sending them to this office. Subscribers who began after the last volume commenced can be supplied with the deficient numbers.

Miscellanics.

From the Worcester Egis.

THE WONDERS OF THE DEEP.

The bounty of nature has spread flowers and herbs over hill and valley with boundless profusion. The insect hosts flutter in the sunshine or square miles." hum among the trees. Field and forest are swarming with life in its various forms. The varieties of animated being, forming a chain of existence extending to objects so minute as to stop, and look at every one who passes by, from elude the sight, and rising so high as to exceed the power of human observation, have been diligently examined, and catalogues and descriptions tell us the names and inform us of the man- is in seeing half a dozen men abandon their emners and habits of many of the tribes of earth and air. The waters equally populous, have of never before seen a mortal, or were desirous to course been less successfully explored. Of the see every button on his garments. monsters who feed among the caves, or gambol in the deep, we yet know but little. Occasionally some odd fish presents himself to the observation if they are engaged in doing something of conof the sailor, and the account given of its appear-siderable importance. Every one must perceive ance is so strange that we rank it with "fish how agreeable it is to a man to be obliged by the terrible glitter of his eyes through telescopes, we are still left in doubt whether it be a creature of real existence or of imagination. The diving fail to deck the windows with as many faces as bell has occasionally been employed in the ex- the house can supply; and if the windows will amination of shallow places to direct the labors of industry, but the boldness of adventure never has descended to those depths where we should expect to find the haunts of monsters, and one of the most remarkable inventions of modern improvement has been ineffectual in reclaiming the treasures of human wealth gathered during successive centuries to the deep, or in discovering the gems and metals, the spars and corals that adorn its cells. Scientific enquiry has been busy in examining those animated beings so infinitely varied in form and structure and so multiplied as to exceed the power of figures to number, floating on the surface. The following extract from Scoresby, copied into the last American Quarterly Review, shows the known myriads of the population of the sea, and may give some idea of the probable extent.

"The number of medusa," says Scoresby, "in the olive green sca, was found to be immense .-They are about one fourth of an inch asunder .-In this proportion, a cubic inch of water must con- who asserted that he did not believe there was a tain 64; a cubic foot 110,592; a cubic fathom, 23,887.872; and a cubic mile, about 23,888,000,-000,000,000 ! From soundings made in the situation where these animals were found, it is probable the sea is upwards of a mile in depth; but whether these substances occupy the whole depth, is uncertain. Provided however the depth to which they entered be but 250 fathoms, the above immense number of one species may occur in a space of two miles square. It may give a better conception of the amount of medusæ in this extent, if we calculate the length of time that would be requsite with a certain number of persons for counting this number. Allowing that one person could count a million in seven days, which is barely possible, it would have required that 30,000 persons should have started at the the schoolmaster, " M .creation of the world, to complete the enumeration at the present time."

immensity of creation, and of the bounty of Divine Providence, in furnishing such a profusion of life Westmoreland Sessions) for stealing an old jackin a region so remote from the habitations of men! ct from a lime-kiln; proof "was strong as haly But if the number of animals in the space of two miles square be so great, what must be the amount requisite for the discoloration of the sea through an extent of perhaps twenty or thirty thousand [Arctic Voyages, p. 180.]

RULES FOR GOOD MANNERS.

1. If you are at work near the road, be sure to the time he first makes his appearance, until he is out of sight. No one, who has not had the experience of it, can tell how much pleasure there ployment and gaze at him, as though they had

2. When you are passing by neighbors at work never fail to stop and talk with them, especially stories." Although the Sea Serpent has figured rules of good manners to suspend his labor an so much in the waters along our shores, and in hour, especially if he has several hired men in the depositions of those gentlemen who saw the company with him, to a trifling story, or to hear the history of his neighbor's affairs.

3. When a person passes by your house, never not accommodate all, let one or two stand in the

4. If you are passing by a house be careful to look into the windows; by this you may generally know whether its occupants are industrious .-You will likewise occasionally get a glance at n young lady as she sits in the parlor, reading novels, braiding straw, or working lace; which to say the least is worth a shilling.

5. On the sabbath take your stand before the meeting house at least fifteen or twenty minutes before the season of worship commences, and let no one escape your notice, who may come to the house of worship. The pleasure which the young lady experiences, passing twenty or thirty young gentlemen gazing intently at her, may be easily do. imagined; and if perchance she drop her glove or handkerchief, let the blush on her face tell how delightful the task to pick it up .- N. H. Sentinel.

A gentlemen made a very good reply to one know all the world; but it is quite possible that Ports. some one man may know himself."

Praise .- Praise is like ambergrise. A little whiff of it, and by snatches, is very agreeable; but when a man holds a whole lump of it to your nose, it is a nuisance, and strikes you down.

Friends bought with money, fail when money flies; Those won by merit, not till merit dies !

Original Anecdote .- A schoolmaster in one of the neighbouring towns, while upon his morning's walk, passed by the door of a neighbor who was excavating a log for a pigs-trough. "Why," said -, have you not furniture enough yet?" 'Yes,' said the man, 'enough for my own family, but I expect to board the What a stupendous idea this fact gives of the master this winter, and am making preparations. are entitled to a sixth volume gratis.

A poor ragged urchin was tried (at the last writ," the Chairman summed up with clearness and the wisdom of the county jury was now to be condensed. After a long deliberation on this knotty point, they turned round-"Gentlemen, have you agreed upon your verdict?" when the Foreman peeped cunningly from beneath a shaggy front, with about as much intelligence in it as that contained in the face of an ourang-outang, and said, "not guilty; but he ought to be severely reprimanded for stealing it."

I lay it down as a sacred maxim, that every man is wretched in proportion to his vices; and affirm the noblest ornament of a young, generous mind, and the surest source of pleasure, profit, and reputation in life, to be an unreserved acceptance of virtue. [Letters concerning Mythology.]

Great Tunnel through the Silver Mine of Kingsburg, in Norway .- A wonderful gallery has been pierced through the side of the mountain, at the depth of six hundred feet, through which the ore is now transported, instead of being hoisted to the top .- Its length is six thousand feet, and it occupied twenty-three years in its completion. It had been commenced in 1792, but during seven years of one time it was discontinued: it had just been opened. The process was most tedious, being entirely by calcination and hammering, which brott the rock off in flakes. Only two men could work at a time; they both commenced externally; and to their credit be it recorded, that upon meeting they were only two or three feet difference in the level, and none in the direction; it is from six to seven feet wide, and from ten to fifteen high .- Jones' Travels.

A Green Old Age .- Mr. Moore, of Ellsworth, Me. now in his 78th year, is stated in the Ellsworth Courier to have made with his own hands, during the last nine months, 56,000 good shingles which have been sold for \$168, besides attending to the work of a farm. He can hoe, mow or rake as much in a day as any common man wishes to

By a letter from a gentleman now in Dresden. Saxony, it appears that the government of that country is giving particular attention to the extension of its trade and commerce—that it is desirous of increasing its commercial intercourse with the truly honest mun in the whole world. "Sir," said United States, and for this purpose has lately aphe, "it is quite impossible that any one man should pointed Consuls to reside in our principal Sea

NATURAL HISTORY.

The following essay upon the natural history of the Rose Bug was prepared by Dr T. W. Harris of Milton, with a view to the premium offered by the Massachuset's Society for promoting Agriculture, for the best essay on this subject; but the professional avocations of the amiable and learned writer having prevented the completion of it within the period fixed by the Trustees, he had resolved to suppress it. The progress which he had made having come to the knowledge of the President of that Society, he urged Dr Harris to lay it before the Trustees in its present state, and they were pleased to award the Society's premium to the author. We think the readers of this journal will feel obliged to us for inserting it.]-Ed. Mass. Ag. Repos.

Minutes towards a history of some American species of MELOLONTHE particularly injurious to Vege-

Nempe Metatoutha dicitur, quia pomorum est pernicies.

The Linnman genus SCARABEDS is very abundant in species, and exceedingly numerous in individuals of some species. These insects are easily recognized by their moveable horns, or antenna. projecting above the mouth, and terminated by several lamellated, or leaf-like joints, whence they have received the name of Lamellicorn beetles .-This genus contains insects differing much in external appearance, and in their modes of life, and has therefore been subdivided into several smallar genera by the Entomologists who have succeeded Linne. De Geer distinguished three families, according to their habits, which he called Scarabes de terre (Earth-beetles,) Scarabes des arbres (Tree beetles.) Scarabee des fleurs, (Flower- beetles) .-Those of the second family are most interesting to the agriculturalist, because of their extensive ravages. They are included by Fabricius in his genus MELOLONTHA, a word used by the Greeks to distinguish these same insects, and which signified, according to Eustathius, that they were produced from or with the flowers of apple trees.*
The Melolonthe are called in England deres or

The genus Melolontha may be characterised as having the body oblong, oval, and convex; the mouth covered above by a thin plate, called lypeus, beneath which are situated the antenna, consisting generally of ten joints, the terminalones united by one end to a common centre, and expanding like the leaves of a book: the torax (satuated behind the head) convex, more o less quadrate or traperodical; immediately behind this, and between the wing-cases, a small triangular piece called scutellum; wing-cases or eytra

* The French name is hanneton, probably acorruption of altton from ali and toro; to make a loud noise with the wings. By several critics the Jelek of the Hebrews, translated canker-worm, was when the sar a 'et' they five away, and heir crament for t place is not 'e.

convex above, not embracing the sides of the They do not confine themselves to grass, but eat hody, and leaving the posterior extremity expesed: also the roots of wheat and other grains. legs of moderate length ; the middle part or tibia of the anterior ones armed with two or three lateral teeth; and each foot, or larsus, consisting of trees as their grads do in destroying the herbage. five small joints, and terminated by two strong claws or nails.

The general habits and metamorphoses of these insects are invariable; a description of those of the common cock-chaffer of Europe, (MELOLON-THA vulgaris F.) will serve to elucidate those of sophical Transactions it is stated that, in the year the whole genus. These are detailed by Latreille 1638, they filled the hedges and trees of Galway (in the tenth volume of his Historie Naturalle, in such infinite numbers, as to cling to each other embodied in Sonnini's Buffon,) and by Olivier, in like bees when they awarm; and when on the the first volume of his Entomology.

This insect devours the leaves of trees and shrubs. Its duration in the perfect state is very short, each individual living only about a week, and the species entirely disappearing in the course of a month. After the sexual union has taken place the males perish, and the females enter the earth, to the depth of six inches, or more, making their way by means of the strong teeth which arm their anterior tibiæ: here they deposit their eggs, amounting to nearly one hundred in number, from every female, which are soon after abandoned, and the females ascend to the surface, and, after languishing a few days, perish also.

From the eggs are hatched, by the warmth of the earth, little whitish grubs, called, in France, vers blancs, cach provided with six legs, situated near the head, and the month furnished with two strong jaws. They live on the roots of plants and other vegetable substances found in the ground; gradually increase in size, and change their skins once a year, about the commencement of spring, after which they approach nearer the surface in search of food; for during the winter they do not eat, but, having penetrated below the reach of frost, remain torpid until the succeeding spring. At the close of their third summer they cease eating, and penetrate about two feet deep into the earth: there by its motions from side to side the grub forms an oval cavity, which is lined by its excrements, and some glutinous fibres, in which it is changed to a pupa by casting its last larva skin. In this state the legs, antennæ, and wing-cases are visible through the transparent skin which envelopes them, but appear of a yellowish white colour; and thus it remains until the approach of the ensuing spring, when the thin film which encloses its body and limbs is rent, and the perfect insect digs its way to the surface of the ground, where the superabundant moisture with which it is imbued, is exhaled, and it expands its wings and takes flight.

According to Kirby and Spence the grub of the cock-chaffer sometimes destroys whole acres of grass, by feeding on its roots. It undermines the richest meadows, and so loosens the earth that it will roll up as if cut by a turfing spade. About seventy years ago, a farmer near Norwich in Engconsidered as some insect of this genus. The land, suffered much by them, and, with his men, words of Nahum, III 17, appear particularly coar- gathered eighty bushels of the beetle. In the acteristic of the manners of the nocturnal species; year 1785 many provinces in Frame ware so raywhich camp in the hedges in the cold day but
aged by them, that a pro

In their perfect state these, with several other species, act as conspicuous a part in injuring the Besides the leaves of fruit trees they devour those of the aycamore, the lime, the beech, and the elm. Mouffet relates that, in the year 1574, such a number of them fell into the river Severn, as to stop the wheels of the water-mills; and, in the Philowing darkened the air, annoyed travellers, and produced a sound like distant drums. In a short time the leaves of all the trees for some miles round were so totally consumed by them, that at midsummer, the country wore the aspect of the depth of winter.

Another chaffer (Mflolontha vitis F.) is sometimes exceedingly injurious to the vine. It prevails in certain provinces of France, where it strips the vines of their leaves, and also devours those of the willow, poplar, and fruit trees.

The animals and birds, appointed to check the ravages of these insects, are, according to Latreille, the common dung hill fowls, different species of owl, the European goat-sucker or night hawk, (CAPRIMULGUS Europæus,) bats, rats, the weasel, (MUSTELA vulgaris,) the martin, (MUSTELA foina) and the bad er, (URSUS meles.) To this list may be added the common crow, which devours not only the periect insect but their larvæ, for which purpose it is often observed to follow the plough. Our own country abounds in insectivorous beasts and birds, and, without doubt, the more than abundant Melolonthe form a portion of their nourishment.

We have several allied species of Melolontha whose injuries in the perfect and grub state approach to those of the European cock-chaffer .-The most common one is the M. quercina of Knoch; (in Melsheimer's catalogue;) it is not described by any author to which I have had access. It is of a dark chestnut-brown colour, glabrous, punctate; the breast pubescent; and each elytron with three elevated lines; length eight tenths, breadth nine twentieths of an inch. This insect agrees very well with the figure and descriptions of M. Fervide of Olivier; but, on the authority of Mr Say, it is considered as the species described by Knock (in his Nenv. Beitrage ur Insectenkunde) by the name of quercina. In its perfect state it feeds on the leaves of trees, particularly of the cherry-tree. It flies with a humming noise in the night, from the middle of May till the end of June, and frequently enters houses, attracted by the light. The grubs devonr the roots of grass and other vegetables ; in many places the turf may be turned up like a carpet, in consequence of the destruction of the roots. The grub is a white worm, with a brownish head, and when fully grown nearly as thick as the little finger.* It is eaten with avidity by

^{*} There is a grub, somewhat resembling this, which is frequently found beneath ans re-leaps,

crows and fowls. The perfect insect is devoured by some insectivorous animal, which frequents our gardens for that purpose, and whose beneficial foraging is detected by its abundant excrement, filled with the wing-cases of the Melolontha.

M. balia, (Say,) a smaller species than the quercina, may, according to Mr Melsheimer, " be found in its proper season in vast numbers under the deciduous leaves of forests: during the night the millions of wings that fan the air produce a loud Length of the male seven twentieths, breadth one humming sound, not unlike that emitted by the fifth of an inch. Length of female two fifths, enraged occupants of a humble-bees' nest." This breadth five twentieths of an inch. It feeds on species, with another, M. hirsuta, (Knoch,) are found in Massachusetts, but not in such quantities as the quercina. The balia is of a light chestnut brown; head and thorax blackish brown; the former and the breast beneath hairy. It is rather more than thirteen twentieths of an inch long .-M. hirsuta is dark chestnut, and hairy; the thorax with dilated punctures, and the wing-cases with five or six longitudinal series of hairs on each.-Length seven tenths of an inch.

Several other species are common here, but their specific names are at present 'unknown to ne. Of the smaller ones, are some which attack the wild rose and wertle-berry bushes. great abundance, and generally paired. Mr Melof May, the time of the sexual union of the species, it may be seen flying amongst the whortleberry bushes in profusion."

These species are nocturnal insects, never apwhich they remain under the shelter of forests, or concealed beneath the leaves of shrubs and grass. Others are truly day-fliers, committing their rava-

to our observation.

inch.

One of them appears about the middle of May. It eats the leaves of the pear-tree, and feeds also on those of the poplar and oak. It is a large insect, and was described by Linne as the SCARA-BEUS lanigerus. The body is of a broad oval shape, and compressed or flattened; the head and thorax yellow, bronzed; the wing-cases pale yellow, punctate; the legs brownish yellow with shades of green; the body beneath green bronzed, and clothed with long yellow down. Length nearly one inch; breadth rather over half an inch. It is not constant in its appearance; in some seasons being found in great profusion, when, by shaking the young pear-trees, any number of them may be obtained.

Another large species attacks the grape-vine. It is the SCARABEUS punctatus of Linne. The wing-cases are testaceous or brownish-yellow, with three distant black spots on each: the thorax darker, slightly bronzed, with a black spot each side; the head green-bronzed round the eyes; the body beneath and the legs deep green,

and is commonly called muck-worm; it differs, however, in some respects, from that of the ME-LOLONTHA, and produces an insect generically disby Mr Say.

Concord Gazette of July 28.

From the National Intelligencer.

CULTIVATION OF SILK.

The culture of silk seems likely to be seriously entered into in this country : practical men in different parts of the Union having taken the experiment in hand. Amongst these is Mr Joshua Peirce, whose nursery and farm on the banks of the Rock creek are at the distance of a short but nomantic ride from this city and Georgetown .-From him we have received the following letter, which shows that he is liberally disposed, not only to acquire information, but to impart it for the benefit of others.

Linnaan Hill, near Washington, June 7th, 1827.

Messrs Gales & Seaton-Having engaged in the raising of Silk Worms with a view of making an experiment as to the practicability of making it a lucrative business, and of introducing them into bronzed. Length one inch, breadth over half an this section of our country, I have now on hand about eight or ten thousand which have just commenced spinning, and, as a number of my acquaintances have expressed a wish to see them, you will much oblige me by giving notice in your paper, that they will be exhibited gratis for the opining the skull of the deceased, an offluvia came tinct, which is described as the Scarabæus relictus, present and next week, Sunday excepted. All ou resembling that which proceeds from old persons desirous of sceing them are invited to call soked rum casks.

A small species also attacks the vine; it is at my residence at Linnæan Hill. As it is a sub no doubt be read with much interest by many of your subscribers. I send you McMahon's gardening, which contains quite an interesting article on the subject, and beg leave to suggest to you the propriety of inserting it in your paper.

Yours, with much respect,

JOSHUA PEIRCE.

We have pleasure in availing ourselves of Mr McMahon's Gardener's Calendar:

About the year of Christ 551, two Persian monks, employed as missionaries in some of the Through the whole season till within a few christian churches established in India, penetrat productions into a variety of elegant fabrics .extensive this failure of the crops may be is un-stantinople these mysteries, hitherto unknown, or certain, but persons from several different towns very imperfectly understood in Europe; and unhave all concurred in the same tale, that their dertook to bring to the capital a sufficient number of those wonderful insects. This they accomplished, by conveying the eggs of the silk worm in a M. iricolor of Say. About the last of June and tion has discovered acres of this grain, where ten hollow cane. They were hatched, and afterwards first of July the two first of these species may be days ago the stalk had attained nearly four feet in fed with the leaves of a wild mulberry tree, and multiplied and worked in the same manner as in those climates where they first became the objects of human attention and care. Vast numbers of these insects were soon reared in different parts of Greece, particularly in the Peloponnesus. Sicihave been the state of the atmosphere to destroy ly afterwards undertook to breed silk worms, with the crop of oats, while all other grains are good, equal success, and was imitated, from time to time, we know not, but the fact is beyond dispute. Had in several towns of Italy. In all these places, extensive manufactures were established, with silk

"From the reign of Justinian, it was mostly in have been much less. But as it was, the grain had Greece, and some of the adjacent islands, that silk worms were reared. Soon after the conquest of Constantinople by the Venctians, in 1204, they attempted the establishment of the silk manufacture in their dominions; and in a short time the silk labrics of. Venice vied with those of Greece

and Sicily.

"About the beginning of the fourteenth century, the Florentine manufactures of silk became very considerable. It was introduced much later into France; the manufacture of silk though consideably encouraged by Henry IV. not having beer fully established there, till under Louis XIV. by Colbert.

"t is an established and well known fact, that bot! the white and the black mulberry trees grow as vell in almost every part of the United States, as it any country on earth; and also that silk has beer raised and manufactured into a most excellen fabric, under the direction of that great and vererable patriot, and friend of mankind, Dr Benjamn Franklin. That so useful a pursuit should be suffered to die away, in a country as well adopted for it as any in the universe, is as extraordinary as it is unfortunate and injurious to the red interest of the nation."

Old Soaker." Professor Francis, in giving his tetimony before the Court in New York durin a recent trial there for murder, stated, that on

RUSSIA.

The state of agriculture in Russia is very low. Grain is raised in sufficient quantities to supply the country with brend and whiskey, and to leave a large excess for exportation; yet by a comparison of the crop with the seed for several years, it appears that the produce is only 3 for 1. There are a few estates which yield 10 to 12 for 1, but there are so many that give only 2 for 1, that the average crop cannot be more than 3 for 1 of seed. The peasants have no lands of their own; they cultivate those of the crown or of their lords, and have no inducement to adopt any new modes of culture. They have but few wants, and are extremely ignorant and indolent. In Denmark ryc *produces 8, barley 10 to 14, and oats 10 for 1.

In Livonia, the inhabitants make hollow places in the trees of the forest, to receive and cultivate bees. Some of them had hundreds, and even thousands of these bee-hives. Mr Butner, a Livonian clergyman says the air, at some distance from the ground, is better for the bees than that of the bee-houses which receive the exhalations of the earth. Where forests are not conveniently situated, he says it is advantageous to place the hives upon trees standing alone, at 12 or 15 feet above the ground.

HAIL.

Storms of hail are frequent and destructive in the southern parts of Europe, and the subject of protecting the crops from their ravages by paragreles, or hail-rods, has excited much attention and discussion in France, Italy, Switzerland, &c. The Bulletin for March, 1827, notices 23 publications, (some of more than 300 pages) upon the officacy of these rods. Many fields furnished with paragreles have been preserved from the hail, while those in the vicinity, which were not so armed, have been ravaged. In some places, however, the hail-poles have not afforded effectual protection, and these failures have furnished arguments for those who oppose the system.

Paragreles are poles set in the fields, around which are wound ropes of straw, iron-wire, or other conductors of electricity. It is believed in France that electricity is an important agent in the formation of hail, and that this formation may be prevented by drawing the electric fluid from the clouds, by the aid of elevated metalic points.

SHEEP.

The English have had more regard to the form than to the fleeces of their sheep, and most of the 44 millions in that country are of the long-wooled large breeds. Fine wool for the manufacturers is imported from Saxony and Spain. The Saxons have given their attention to the fleeces, which they have brought to so great perfection that Spain possesses no flock that can be compared with some of those in Saxony. Sheep of the Saxon race are pretty numerous in the neighbouring countries of Silesia, Moravia, &c. In France there are but few flocks of pure merino blood. The French import great quantities of fine wool from Spain and Saxony, and they are now making efforts to introduce the Saxon race of sheep into France. Some of the French farmers have purand are attempting to acclimate them in France, struck in the street, reached nearly double the This long wool is in demand for the manufacture distance it did when raised in the steeple. of smooth stuffs, as bombazets, &c. It is admitted that the English sheep cat twice as much as the

M. L. de Chatenuvieux says the merino sheep are so multiplied in Europe that there must necessarily be a reduction in the price of their wool. He thinks the price of the superfine wool from the Saxon merinos will continue to maintain a high price, because there are but few persons who will bestow that care and attention on their flocks. which these small and delicate sheep require .--He expresses an opinion that the Saxony sheep come from the race of Segovia in Spain, and that stopped glass or stone jars. most of the other merines in Europe proceed from the race of Leon, which is larger and more vigorous, but less fine.

GRAPE VINES.

Horticultural Garden, Brooklyn, July 21, 1827.

SIR-I take this opportunity to inform my friends and the public, to whom I announced with what perfect safety the vines producing table grapes, imported by me from the north of France, had sus- the cart. The grass is so heavy, that it requires a tained, without any covering, the intense cold of strong arm to carry the scythe through the swaith. the last winter, that they are the kinds which I which, when turned out, looks like a whole winkinds of vines for vineyards from the north of France bore the winter equally well.

I deem it necessary also to inform the public that north are more compressed. It is the opinion of Dr Pascalis, who is a prtive of the south of France, that this observation applies more particularly to as the agriculturalist. exotic grape vines, and that the plants should be chosen from a climate and temperature as simi lar as possible to those of the country to which they are to be transplanted. Besides, the vines from the south being more early in vegetation, are more liable to be affected by sudden changes from cold to heat, and from heat to cold, so prevalent in this climate in spring.

I warrant my vines to grow, not only by assertion but by proof, and that they are of the genuine kinds, having an establishment of which I each soil and situation. The established price for vineyard vines is 25 cents by the quantity.

Those persons who have followed my instructions are perfectly satisfied with the success of the planting and growth of their vineyards.

Mr B. has formed a vineyard at his country seat on Long Island. The plants were not furnished by me. He has teld me himself that he had lost 4000 of the 8000 plants that he had set in the ground this spring, which is an enormous loss so fast, that they might be caught with a hook in considering the price of labour, the delay, the disthe proprietor in replacing them. This disappointment has happened to him although the spring has been uncommonly favourable by a succession boiled malt, or fresh grains, are proper food; thus, of warm rains and genial heats, which are the carp may be reared and fed like capons, and tench such favourable springs cannot be often expected and malt coarsely ground, are equally fettening. un this climate.

Respectfully yours, ANDREW PARMENTIER.

IMPROVEMENT IN THE ARTS.

We observe, in the Auction Hall of the Exchange, a large street lamp, or lantern, manufactured at the Jersey Glass Works, in a manner different from that of any article of the kind heretofore produced in this country. Its peculiar merit consists in being made of stained and marbled glass, by an artist from England; who we should imagine could not fail to find encouragement in his line in the United States. The colouring and ornamenting of the material (common window-glass) is beautifully done, and may be adapted to the greatest variety of fashionable and useful purposes. The dyeing or staining has been witnessed before, in some specimens from the same hand, but nothing in its present state of finfore in America. From what we perceive of this improvement in the art, we may rationally expect the attention of builders and directors of churches, and other public edifices, to be attracted towards it-so peculiarly adapted to the solemn and magnificent in architectural beauty and grandeur, as well as calculated for the more humble but general and practical accommodation of the fanciful and curious in the minor branches of commerce and trade.

MACHINE FOR RAISING WATER.

G. Bradley of Newton, Con. has sent us a partial account of a self acting machine, invented by them for raising water. There is a brook a little distance from their dwelling house, the bed of which is 18 feet lower than the sill of their house. The water of their well would not answer to wash with, and they were compelled to resort to the brook, until their necessities became the mother of invention to them. They have invented a sim-

ten dollars, which raises water to the amount of attached to the machine. They are fully satisfied ute. from this experiment, that water may be raised on the same principle to the height of 50 feet or more, in large quantities, for the purpose of carrying water wheels of every power-supplying distilleries, tan-yards, and farms on which there is ne living stream, &c. They have not given a very satisfactory description of the machinery, but say " a fall of 2 feet is necessary in raising the water 10 feet, and in that proportion for a greater or less distance. Suppose a person has a spring near his house, he has only to set up a penstock, throw the water into the top of it, and then put in, a lead pipe at the bottom of the pensteck, and take it to your house." They will give further information to those who will write them, (post paid.)

N. H. Register.

CANADIAN, OR TREE ONION.

This is remarkable for producing a bulb or on on at the top of the stalk.

The stem of this plant is naked and round; and the leaves are flat and narrow.

These opions are well deserving of attention. both as objects of curiosity, from producing an onion upou the stalk, and also for their use. When pickled they are generally thought superior in flavour to the common onion.

They were originally imported from Canada: are perennial, and are propagated by planting the bulbs in the spring or autumn. Either the bulbs of the root or those on the stalk will grow.

TO FATTEN FOWL.

At this season of the year, the most economical method of fattening chickens is to give them curdled milk. The practice, as far as we have observed, is to shut them up in some cool place, and confine them to sour coagulated milk, with a little meal or corn two or three times a week. On this food they soon become fat. [N. York pap.]

GINGER WINE.

The following recipe for making a pleasant ginger wine, is recommended from experience.

To 20 gallons of water, add 80 lbs. honey, or 70 lbs. sugar, the former in preference; boil and skim as the feculent matter rises; put the mixture into an open head, and add half an ounce of ginger coarsely ground or bruised, to every gallon of the mixture; and when cooled, ferment and proceed as in elder wine, adding to every 10 gallons, when bunging close, one fourth of brandy; and if the flavour of the orange is required, proceed as in currant wine.

BURNING-GLASSES.

These instruments are undoubtedly of very ancient origin; the most celebrated were those of Archimedes and Proclus; by the former of which the fleet of Marcellus was destroyed at the distance of a bow-shot. In modern times, there have been several inventions of this kind, remarkable for their large diameter and powerful effects; the principal of which are those of Magine, of Sepatala, Settala, and Buffon; the latter of whom made one that consisted of 400 mirrors, which reflected all their rays to one point, and with this he could melt lead he taken to pass the roller the same way that the and tin at the distance of 140 feet.

Sir Isaac Newton presented a burning-glass to

ple but durable machine, at a cost not exceeding cave glasses, so placed that all their foci join in to the fore end of the plough beam, in the place one physical point. This instrument vitrifies brick of a foot, or even a foot itself, will greatly help to 1440 gallons per day. There is no wheel or pump or tile in one second, and melts gold in half a min-clear the way for the coulter. But the most ef-

> New Well .- Mr. Disbrow has been employed for some time in boring a well for the Corporation in Jacob-street; and has lately stopped on striking an abundant spring, at the depth of 125 feet. The water is thought to have peculiar properties, and has been submitted to a hasty analysis, which gives a large quantity of muriate of Soda, and a little of the sulphates of magnesia and soda, muriate of magnesia, and carbonates of magnesia, lime and iron. It shows little evidence of uncombined gas; and the only decided taste it has is something like that of tar, the cause of which we believe has not been ascertained. Many thousands persons have already been to the spot to taste the water ... N.Y.

Chambers' Medicine for intemperance have been of great importance: the stubble left on the land administered in this village to individuals who are in the almost constant practice of indulging in the vents the plough from turning in the land with vile habit of drunkenness. The effect is that a neatness, and a crop does not succeed soon enough complete reformation has taken place in their to feed on it; but carted into the farm yard it betastes, so that instead of hankering after the hour- comes an excellent manure. Any sort of litter ly dram, the very smell of spirituous liquor has become offensive. We hope it will prove lasting. Herkimer American.

There is a very large manufactory of mill saws in Philadelphia, at which it is said they are made one third cheaper than they can be imported, and so much better that persons, who know the value of an American saw would give one third more

The price of poultry in London at present is enormously high. Young fowls were selling at \$2,00 each, and ducks were equally dear. Contrast this with the price of poultry in this country.

NEW ENGLAND FARMER. BOSTON, FRIDAY, AUGUST 3, 1827.

STUBBLE.

There are four modes of managing stubble land, viz. 1. To plough in the stubble as soon as possible after harvest. 2. To cut it up close with a scythe and cart it into the barn yard for manure. 3. Burn it on the land without cutting. 4. Let it remain till it wastes away, and is decomposed by the course which nature adopts in restoring vegetable and animal substances to their primitive elements. We will speak of each in its turn.

1. When your land is light and sandy, the stubble of wheat and rye may be ploughed into the soil to enrich it. This, together with the weeds will be equal to a moderate portion of manure .-With ploughs of the common kind, however, the ploughing in of stubble is difficult and disagreeable. The plough is apt to choke up, so that it is more than a man can well do to keep it clear .--Ploughs for this work should be much deeper built. than the common ones. And this work might be greatly facilitated, if a heavy roller were passed over the stubble, to lay it flat to the ground before the Royal Society, which consisted of seven con- this rolling be neglected, a small roller annexed into chaff and mixed with other food."

fectual mode for preventing a plough from clogging is to use what is called a plough cleaner, invented by Mr Joseph Kersey of Pennsylvania, of which we gave a drawing and description in the New England Farmer, vol. i. page 107. It consists of a piece of timber, pinned to the plough beam just before the coulter, with a staff or handle attached to its upper end, so placed as to come within reach of the ploughman, who by pulling the handle, turns the piece of timber on the pin. and causes the lower and to scrape the ground just before the coulter, and thus remove atubble, weeds, and other obstacles to smooth ploughing.

2. The celebrated Arthur Young advises the cutting wheat and rye stubbles, and raking into heaps for carting home to the farm yard for litter: and says " This is a business strangely neglected Cure of Intemperance. - A few doses of Dr. in most parts of the kingdom; but is nevertheless is not of much advantage as a manure; it prethere is valuable, and serves for the cattle treading into the dung. In those parts of the kingdom where this use of stubble is common, the price for cutting and raking into heaps is from 2s. 6d. to 3s. 6d. per acre (1798); a very small expense compared with the great advantages that undoubtedly result from it."

> 3. The mode of burning stubble on the ground has been heretofore detailed in the New England Farmer, vol. i. page 413, and vol. iv. page 6. It is highly recommended, and in many cases is, doubt-

less the most eligible practice.

4. Letting stubble remain to waste and decompose on the field can only be advisable when there is a good bite of grass growing among the stabble which you intend shall serve as fall feed for your cattle. See further on this subject, N. E. Farmer, vol. iv. pages 5, 6.

HARVESTING PEASE.

Garden pease are harvested by picking them off as they ripen; but field pease must of course be harvested all at once. They should be mown before they begin to shell out. Those among them which are unripe, will ripen, or at least become dry, after they are cut or pulled up; and such pease, when well dried are not unfit for the table. though their colour renders them less valuable in market. Mr Young says "The stalks and leaves of pease being very succulent, they should be taken good care of in wet weather; the tufts, called wads, or heaps, should be turned or they will receive damage. The straw, if well harvested, is very good fodder for all sorts of cattle and for sheep; but if it receives much wet, or if the heaps are not turned, it can be used only to litter the farm yard with."

Loudon observes that "in the early crops, the haulm is hooked up into loose open heaps, which, as soon as they are perfectly dry, are removed from the ground and put into stacks for the purploughing. When this is doing great care should pose of being converted to the food of animals, on which they are said to thrive nearly as well as on plough is to go. By means of this, the coulter hav. When intended for food for horses, the best will but seldom be clogged with the stubble. If method would seem to be that of having them cut

CATTLE AND SHEEP IN PASTURES.

Careful graziers make it a rule, however extensive their farms may be, to ride round and see every beast in every enclosure at least once a day. Plagued with flies, suffering from thirst or want of food they are very apt to break through fences, and commit trespasses, which at this season are more than commonly injurious on account of the state of the crops.

FOLDING SHEEP.

Mr Arthur Young says, "in respect to folding sheep, a very great change has taken place on inclosed farms in the practice of the best farmers, especially in Norfolk. They are now fully convinced, that it is an unprofitable practice, except where the openness of downs and common fields renders it necessary for the purpose of confinement. The number of sheep that may be kept on a farm, without folding, is much greater than can be supported with it. This is a very essential point. There is a deduction from the farmer's profit, in the injury done by folding, to both cwe and lamb, which has been estimated, by experienced judges, at from 2s. 6d. to 4s. per ewe; so that a farmer should consider well before he servations is pronounced unprofitable. Mr Bakewell used to call it robbing Peter to pay Paul.

"I am perfectly persuaded, that it would have land, nearly such a stock as I have done, if in one ed. When sheep are kept in numerous parcels it the head and tail of it, by which means one part their remaining perfectly quiet in small parcels.

many gentlemen over my fields, with a view to the old system. examine whether the sheep had seemed to have rested only on spots, to the too great manuring of permitting sheep to feed at large in pastures, as such: or on the contrary, to have distributed well as increasing the numbers of this very useful themselves more equally; and it was a pleasure animal, may be found in the benefit, which the to find, that they seemed generally to have spread in every part, if not equally, at least nearly so .---The improved countenance of several old lays fed | xxvii.) that it is the opinion of many eminent farin the same manner convinced me as well as my mers that nothing recruits poor soils so much as bailiff, that the ground had unquestionably been heartily feeding them with sheep for some years, improved considerably.

Folding in littered yards is described by Dickson (Complete Farmer, art. Sheep,) as combining ciple with success. The effects of keeping a very all the advantages of folding on arable lands with- full stock of sheep upon the land is that they preout any of its disadvantages. By this practice the vent any seed stems from rising to exhaust the and a little salt for seasoning, without the addisheep are confined in a yard well and regularly soil, and thereby give to the grass plants, which tion of milk, butter, eggs, &c. according to usual littered with straw, stubble or fern; by which they constantly keep pared down and bare by their means the flock is said to be kept warm and close bites, a habit of matting, and spreading their healthy in a bad season, and at the time a surpris- roots, so as to form a firm turf, and a close growth persedes the necessity of other and more expening quantity of manure accumulated. A great of delicate grasses. This, like every other valua-sive materials. improvement on this method, it is said, would be, ble practice may, no doubt, be over-done, particugiving the sheep all their food (except their pas- larly during a long, hot, and dry summer; beture) in such yard.

either on account of the sheep, or any alleged ad- cat when young, they have a tendency to clear vantage from the manure they make."

We believe that folding, or crowding them to- courage the exclusive production of grass." gether in close pens may be very injurious to their health; and doubt whether, in general, any bene- paring a particular spot for turnips is a practice fit derived from their manure can compensate for not without its advantages; and formerly a turnip forcing them in large flocks into comparatively yard, in which sheep or neat cattle had been ensmall yards, pens, or enclosures, especially in warm closed for a certain number of nights, was an apweather. Still, in our climate, they sometimes re-quire, or at least are the better, for occasional be doubted whether sheep are not more injured by shelter. Sheep are so well clothed by nature that being crowded together in yards, in a season of they rarely if ever suffer from cold, provided they the year, when, if left to themselves, they would are kept dry. But foul air and moisture are very feed principally in the night, than the land or its injurious to this animal. The opinion of Mr Law- owner is benefited by the practice of folding. rence appears to us to be correct, who says, " To Turnips may, we think, be raised with more econevery farm yard ought to be attached a sheep- only, as a second crop, by ploughing and preparing vard or home fold, completely fenced in, and either stubble or grass land, than by the old method .totally or in sufficient part surrounded with sheds But though sheep should rarely if ever be folded, composed of any cheap material. The sheds to we think they should as rarely be destitute of sheds be closed up, having windows for the admission of as other buildings, in which they may obtain shelair, to as great an extent as may be judged neces- ter or remain in the open air at their option .sary, the remaining space to be left open. The Sheep, as well as animals in general, are the best whole to be divided into pens for the needful sep- judges of their own wants, and seldom make a aration of the flock. The bottom to be littered, wrong choice when allowed the liberty of choosand I think it is better for the health of the sheep, ing. adopts a practice which, from a multitude of ob- that their manure should be frequently cleared away, rather than suffered to remain a whole season as is usually practised. On extensive sheep farms, there should be as many of these covered been impossible for me to have kept on the same folds, in the most convenient situations, as are necessary in order to completely secure the whole parcel with folding. I do not conceive that the flock. The most convenient part of these folds or fields would have carried three-fourths, so manag- enclosures, must ever be reserved for the first ewes expected to lamb; and thither they must, is not only driving to and from fold that affects after selection, be driven and confined in good them, but they are, in fact, driving about in a sort time; and so on in succession, by which a numerof march all day long, when the strongest have ous train of risks and mischiefs may be avoided. too great an advantage, and the flock divides into In feeding, the sheep should be divided into lots, nished us with the receipt has also laid us under sufficiently small, and properly assorted, as to of them must trample the food to be eaten by an- strength and condition. In grazing abroad, upon other. All these points are the very reverse of enclosures, the practice of division into small flocks of strong and weak, is excellent, and pro-"I attended, through the course of a summer, ductive of numerous advantages unattainable in

A very strong argument in favour of usually soil receives from their being pastured upon it .-Mr Young observes (Annals of Agriculture, vol. provided the sheep are not folded away from the land, and he himself has practiced upon this prin-British Encyclopedia says "that such a method and by their dung, grass lands are greatly melio-

be rash to deny; but generally it is not advisable | As there are very few plants which they do not pasture land of almost all noxious weeds, and en-

FOOD FOR CATTLE.

We know of no person in New England, who has been so successful in that branch of rural economy which consists in the breeding and rearing of neat cattle as Col. SAMUEL JAQUES, jr. of Charlestown, Ms. and we think that he has merited the thanks of the agricultural community for his liberality and public spirit, in communicating the mode by which he has fed his fine steck, with probably less than half the expense which would have been incurred in the common methods of treating the animals. The gentleman who furgreat obligations, and will please to accept our acknowledgements for the favor.

The following has been used by Col. JAQUES with the best success for feeding cattle,

Take Ruta baga, cut fine, 2 bushels Wheat bran . . I bushel Powdered oil cake 1 bushel English hay, barley straw, 7 bushels. and salt hay, cut, of each, Water 10 gallons.

Let them be perfectly mixed. Give a bushel of the mixture to a cow of the common size every night and morning, and proportionably to greater or smaller animals.

Whortleberry Pudding .- We are assured by a friend to improvement in domestic economy, that the whortleberry will make a very excellent pudding, when properly mixed with flour and water, mode of making puddings. The whortleberry adds a richness to the other ingredients which su-

How to subdue the Flag, or Cat's Tail Weed .cause, such a season, if the land is much over There are few weeds which infest our mowing But even this method of folding sheep, though stocked with sheep, they are under the necessity grounds which are more pestiferous, or are genwarmly recommended by some celebrated English of biting so close, that they are apt to destroy the erally considered more difficult to subdue than the agriculturists, is condemned by others. The writer of the grass. In other respects, however, flag, by some called cat's tail, so common in ter of the art. Agriculture in the Supplement to the there is no doubt, that both by the mode of eating, swamps and low meadows. A gentleman assures us however, that by cutting the plants as close to may be advantageous in particular cases, it would rated by being fully stocked with these animals. the ground as possible in June, in warm and dry

weather they may be subdued. The grass among which they grow, and which may be cut with them will soon start again, but the flags will be quite destroyed root as well as top.

Pine Apple Cheeses .- The Litchfield Post says Mr Timothy Collins of Goshen, (Con.) makes 12 pine apple cheeses daily, weighing 7 pounds each, which will sell for from 12 to 20 cents per pound. These cheeses are called pine apple cheeses, from the great resemblance they bear to that fruit .-The processes of pressing and drying are novel and interesting. Cheeses of the same kind are made at other dairies in Goshen. They possess no advantage over the common kind, except that of keeping longer in warm climates .- Hamp. Gaz.

For 11 years past, the average proportion of deaths in Boston has been one in 41; New-York one in 38; Baltimore one in 35; Philadelphia one in 32. In New-York one in 5 of the deaths are by consumption; in Boston one in 54 .- Ibid.

Defeat and Butchery of the Greeks .- The last Paris papers contain inclancholy tidings concerning the poor Greeks-two thousand five hundred of whom had been put to the sword! The Commercial Advertiser says-

"The Greeks, it seems, had assembled 10,000 men for the relief of Athens. Four thousand had marched in the direction of Asomato, at the north of the Pyreus, for the purpose of attacking the Turks in the rear, who occupied a fortified position among the clive groves, while the other troops were to attack them in front. On the 4th, Kariaskaki commenced the attack on the Turks and was killed, with 300 of his men. On the 6th an engagement took place between the Turks and those Greeks who had effected a landing from the fleet. Two thousand men, sent by Redschid Pacha, attacked them, and the defeat and slaughter of the Greeks was horrid. Out of 22 Philhellenists, 18 were killed. The total loss of the Greeks in killed was 2,500 men. Lord Cochrane with difficulty succeeded in taking on board the fleet the remnant of the Army, and General Church in rallying his troops, narrowly escaped being made prisoner. The expedition is said to have been well planned, and the defeat is attributed to the superiority of the Turkish cavalry. The Greeks, however, tho' defeated with great loss, still continued their efforts for the preservation of Athens. At the receipt of the last intelligence, General Church still kept possession of the heights of Phalermo with 3000 men, and on the 16th of May, that is ten days after the defeat, the Acropolis held out. On the 13th, Lord Cochrane was scouring the Archipelago in search of reinforcements.

The garrison of St. Spiridion, manned by a few handred Turks, had been taken by the Greeks, who massacred their infidel foes. This movement so incensed Redschid Pacha, that he caused all the Greeks in his power to be beheaded. On the 25th of April, it is stated, upwards of 2000 Greek women and children were massacred!

A fine corvette, of 18 guns, built at Marseilles. for the Pacha of Egypt, was said to have been captured by a Greek brig.

Nearly all the national vessels at Toulon, France were preparing for sea with the greatest expedition. Various rumours were affoat on the subject.

At Ballston the celebration of the 4th was peculiarly interesting and appropriate. The revoletionary veterans of the vicinity were assembled, and proceeded to the battle ground of Gates and Burgoyne. The different spots and positions distinguished by the most remarkable events and scenes of that memorable campaign, were visited and brought to the recollection of the spectators by the recitals of these living witnesses and actors of the day.

A new Catholic Church was opened at Opelousas, Louisiana, on the 10th ult. About 1000 persons were present. The church is calculated to contain between I and 2000. This is a further proof of the growth of the country-which will be great and happy, if people will restrain their passions, and not suffer themselves to be excited to violence for imaginary or small evils.

The late Mr. Windham was at a country sesthe Gospel," and not one of them was correct .but the other " preacher of the word " could nei- ficient numbers. ther read nor write. On admitting this fact, one of the magistrates asked, in amazement how he could " preach the word," without the facility of some little reading? "Very well," was the reply; "Mother can read, and I can 'spound."-Dublin Morning Register.

The Haverhill Gazette states that two enterprising individuals of that town have purchased a new steam engine, and are now preparing a boat to run as a regular packet on the Merrimack, between Haverhill and Newburyport. The boat will probably be in readiness for passengers in all next month.

The Newburyport Herald states that the boats which have returned to that port from mackerel fishing have not landed fish enough to pay their outfits. The fish are said to be very scarce in the Bay this season.

Patterson, a manufacturing town in New Jersey, contains 6236 inhabitants. 1453 persons are employed in the factories, whose annual wages are 221,000 dollars.

A jury in England has returned a verdict of manslaughter against the Engineer of a steamboat for the bursting of the boiler, by which a person got scalded to death.

A Leap .- We hear that some rude, unfeeling boys, a few days since, took a Dog and threw him into the rapids of the Niagara river, just above the Falls, and that the poor animal, in despite of his exertions, was precipitated over the stupendous precipice: when, strange to record, the Dog was discovered in the tumbling flood, by the ferryman, pulling for the shore; up-on reaching which he was found to have sustained only a slight injury on one of his legs. [Black Rock Gaz.]

A letter from an American gentleman in Paris, says that Mr Warden, former consult of the U.S. has met with a book, 100 years old, which contains a theory of the earth similar to that of captain Symmes.

It is reported that the venerable Charles Carroll, the only surviver of the Signers of the Declaration of Independence, has given \$70,000, towards the Maryland and Ohio Rail Road. The Rail Road Scrip is at 100 per cent advance.

A communication from Smithfield, R. I. will appear next week.

Wool.

On Thursday, the 23d of August, at the lower division of the hall over the new Market House, under the direction of the New-England Society, will be sold, a large assortment of American fleece WOOL. Wool growers and others, who wish to benefit by this favourable opportunity for disposing of their Wool, are informed, that we are prepared to receive it, any time previous to the 17th of August, at which time the catalogue will be closed. COOLIDGE, POOR & HEAD, Auc're Boston, July 27, 1887.

For sale at the Agricultural Warehouse, No. 52 North Market street, two of Pope's improved hand or horse power Threshing Machines. Satisfactory proof of the utility and operation of this Machine may be had or application as above.

Yellow Locust Seed, - Turnip Seed, &c.

For sale at the New England Farmer office, a few lbs. Yellow Locust Seed, superior scarlet short top Radish, White Mulberry, 13 varieties of Turnip, Girkin or pickling Cucumber, &c. with a new assortment of ornamental flower seeds.

Subscribers to the New England Farmer are insions, at which applications were made by six per- formed that they can have their volumes neatly half sons for licenses to preach. Out of the six, four bound and lettered at 75 cents, which is as cheap as differed in their mode of spelling "Minister of they can be done in this city-by sending them to this office. Miscellanies.

The following beautiful Epitaph on the death of Mrs Hawksworth, was written by her husband 1)r. Hawksworth, and is, we think, a model of this specics of composition.

ON THE DEATH OF MRS HAWKSWORTH BY HER HUSBAND.

Whoe'er, like me, with boding anguish brings His heart's whole treasure to fair Bristol's springs; Whoe'er, like me, to sooth disease and pain, Shall pour these salutary streams in vain; Condemn'd like me to hear the faint reply, To mark the flushing cheek, the sinking eye, From the chill brow to wipe the damps of death, And watch with dumb despair each shortening breath. If chance direct him to this artless line, Let the sad mourner know, his pangs were mine. Ordained to lose the partner of my hreast, Whose beauty warm'd me, and whose virtue blest; Form'd every tie that bids the soul to prove Her duty friendship, and that friendship, love; But yet, remembering that the parting sigh Ordained the just to slumber-not to die; The falling tear I check'd and kiss'd the rod, And not to earth resign'd her-but to God.

MONEY DIGGERS.

Digging for money hid in the earth is a very common thing, and in this state it is even considered an honourable and profitable employment .-

We could name, if we pleased, at least five hundred respectable men, who do, in the simplicity and sincerity of their hearts, verily believe that immense treasures lie concealed in the Green a vine depend on the care of a man. Mountains, many of whom have been industriously and perseveringly engaged in digging it up. Some of them have succeeded even beyond their expectations. One gentleman in Parkstown, on the summit of the mountain, after digging with unvielding confidence and unabating diligence for ten or twelve years, found a sufficient quantity of money to build him a commodious house for his own convenience, and to fill it with comforts for the weary traveller. On stopping lately to refresh, we were delighted by the view of an anchor, on the sign, emblematical of his hope of success, while we left him industriously digging for more. Another gentleman on lake Champlain, we were credibly informed, has actually dug up the enormous sum of fifty thousand dollars! The incredulous and unbelieving may stare at this assertion, but it is nevertheless true : and we do not hesitate to declare our belief that digging for money is the most certain way for obtaining it .-Much, however, depends on the skilful use of the genuine mineral rod. Don't dig too deep, is an appropriate maxim with all those who are versed in the art. Wood's Iron Plough, skilfully guided, is sure to break the enchantment, and turn up the glittering dust in every furrow. Countless treasures yet remain in the earth. Speed the ploughply the hoe-'twill all come to light .- Montpelier, Vt. Watchman.

A little world .- A few twigs, full of sap, were placed in a small quantity of water for several days, until a part of the sap became incorporated with the water. A drop of this water was put on the head of a large pin, and by the solar microscope it was found to contain more than 30,000 living creatures !- Matthews on Sound.

Nantucket .- Perhaps there is not a community in the world which has grown up to the magnitude of the town of Nantucket under such singular and untoward circumstances. This island was settled in 1639. The first civilized inhabitant was Thomas Macy, who fled from the spirit of persecution, which would have inflicted its barbarous punishment upon him for protecting against the mandates of the puritans, a defenceless Quaker. It was then inhabited by Indians. The whites cleared the land and devoted themselves to agriculture, and it can hardly now be received with full credit, that such was the fertility of the soil, the first settlers were not only able to produce food enough for their own consumption, but that from are entitled to a sixth volume gratis.

a place now importing the chief part even of the kitchen vegetables, quantities of pork were shipped for Boston. In 1690 the first whale was taken A widow's child is generally spoiled by the love from the beach and a new direction given to the pursuits of the inhabitants. The right whale was a visitant of the coast in the spring. He could not but attract the attention of adventurers and daring men. On the Cape they had already commenced pursuing this game, and the people here became eager to share in the toil, the danger, and the profits of the pursuit. At the time above stated, one Paddack came to this place, and the business commenced from the south side of the island, on the broad Atlantic. On the beach, where the waves have rolled unnoticed by the whaleman for almost a century, was all the activity and bustle Do not sign any writing which you have not consequent upon landing, in a single day, someread, nor drink any water which you have not times no less than eight fish. It is curious to see how these fish departed farther and farther from the coast, and how the fishing, in consequence, has expanded from the shores of this little spot to the North Atlantic ocean, in spite of obstructions which it seems strange were ever overcome .--Nantucket Journal.

"No Trust."-This should be the motto in every bar-room. If well observed, it would be for the advantage both of the landlord and the customer. The landlord, would sell less, but get more money; the customer would dripk less, work more, advance his own comfort and reputation, and the happiness of his family. A bar-book. is the ruin of thousands. It affords so great facility for a man to get rum when his peckets are empty, that he will take but little pains to fill them by industrious habits. Besides, the man who takes his frequent drams, his slings, his gallbursters, his phlegm-cutters, his anti-fogmatics, his cleven o'clocks and his four-o'clocks, is not aware what an enormous bill he is running up; Children tell in the streets what they hear at and if he were required to launch the ready four pence for every glass, would often look twice at the money, before he allowed it to escape his Berkshire American.1 fingers.

> Immortality .- Bautru, in presenting a poet to M. d'Hemery, addressed him, Sir, I present to you a person who will give you immortality; but you must give him something to live upon in the mean

Saxony Sheep.

On Friday the 24th August next, at 3 o'clock P. M. at Brighton near Boston, will be sold by public aurtion, a choice stock of about 100 Saxony Rams, just imported in the brig Comet, Capt. Meef, from Ham-

These sheep were selected from the purest blood in the kingdom, and will be found at least, equal in point of fineness of fleece and symmetry of form to any heretofore imported. The sale will be perfectly free and unlimited.

Samples of the wool from different parts of each auimal may be seen at No. 46 Central street, or at the office of the auctioneers, at any time previous to the sale.

COOLIDGE, POOR & HEAD.

AGRICULTURE.

[BY THE EDITOR.]

WORMS IN THE HEAD OF SHEEP.

A surt of fly which naturalists call Oestrus Ovis, about this time in the year, attacks sheep, and deposits its eggs in the nostrila of those animals producing worms, which frequently destroy them. A friend has assured us that the following is an infallible preventive of any bad effects from that insect. Smear the nostrils of the sheep with tar : app'y it before the fly makes its appearance, and continue the application till its departure. The tar should be applied two or three times a week, or often enough to keep the nose continually blackened with that substance. Perhaps if the tar were placed under cover, so that the sheep could have access to it, and mixed with a little fine salt, the sheep would make the requisite application. The tar will prove useful not only as an antidote against the troublesome and dangerous insect above referred to, but is an excellent remedy against cough, rot, and consumption of the lungs. It promotes and confirms the health of the animal, and would be useful to sheep, in a high degree if the Oestrus Ovis were not in existence.

EARLY ONIONS.

Mr. James Smith, an English Gardener, in the Transactions of the London Horticultural Society, gives the following "directions for forcing onions to produce bulbs in clusters at an early season." He sows the seed in April, thickly in a bed, and does not afterwards thin the plants which come up; this causes them to remain small; a part of them are used for pickling, and the remainder being about the size of walnuts are planted in January or February [as soon as the frost will permit in this country] pressing each onion into the earth so deep as to just cover it. As soon as the seed stalks appear be breaks them off, and and instead of making any effort to form new ones, the onions begin to form young bulbs round the old ones. By this process onions may be obtained two or three inches in circumference, fit for the kitchen early in Spring, at a time when spring sown onions are not larger than quills .-Onions thus thrown into clusters will be full grown by the end of June, and fit to take up then, but they do not keep well."

A process similar to the above is familiar to American gardeners; and is thus alluded to in Deane's New England Farmer. " If onions fail to have good bottoms the first year, and chance to escape rotting till spring ; they may perhaps get them by being transplanted. Even an onion that is partly rotten will produce two, three, or four good ones, if the seed stems be taken off as soon as they appear. They ripen earlier than young ones, have the name of rare-ripes, and will sell at a higher price.

GOURDS AND POMPIONS.

A writer for Loudon's Magazine says that a Mr Grey plants Gourds and Pompions in the paths

do good to the asparagus roots by protecting them from the sun, while the tall stems of the aspargus afford a shelter to the leaves of the gourds. Lust summer's (1824) drought, had burned up, on his gravelly soil, the cabbages, peas, turnips &c. by the begining of August, and had he not been and a second cutting must take place without deprovided with gourds as a substitute, the family lay. must have had recourse to market. The servants disliked them at first, but soon came to like them better than summer cabbage. He therefore recommends, especially where the soil is liable to be burnt up in summer, planting the vegetable marrow and other Cucurbitaceæ [plants of the melon and gourd species] as a reserve crop.

Mr Loudon adds in a note that " the tender tops of all the edible species of cucurbitacen, boiled as greens or spinage, are a more delicate vegetable than the fruit. It must be worth something to gardeners and cooks to know that either or both may be used for this purpose, when scarcely anything else can be got."

The following Receipt was communicated to JOHN PRINCE, Esq. by FRANCIS WINKLEY, a member of the Religious Society denominated Shakers, of Canterbury, N. Hampshire. It was published in the 2d vol. of the N. E. Farmer, but is now repeated for the benefit of recent subscri-

AN EASY METHOD TO MAKE GOOD SOAP.

The vats or vessels containing it are to be situnted in the rays of the sun; and at the same time sheitered from the rain.

To one barrel of good lye sufficiently strong to bear up an egg about six gallons of clean melted grease, and thus in proportion for any other quantity.* Stir the mixture well together, and repeat the operation twice daily, till it becomes so thick and stiff as to render stirring impracticable. Let it stand in this situation through the summer; or till needed for use, adding a little weak lye occasionally as the soap dries away.

With due respect, your friend. FRANCIS WINKLEY.

* Or add as much grease as the lye will absorb,

FOOT ROT IN SHEEP.

A friend informs us that this disease is very prevalent among flocks of sheep in many parts of the country. In the New England Farmer vol. v. page 233 we gave some remarks on this disease, translated from a letter received by Mr Thomas Searle, of Boston from a correspondent at Leipzig. The following is an extract: "Cut away with a sharp Surgeon's knife not only superfluous hoof, but also all the diseased flesh under it .--This may be distinguished from the healthy flesh by its greyish colour. Being well satisfied that nothing unsound remains in the foot, I then apply with a brush to the fresh wound some caustic liquor and immediately place the patient in a separate clean stable.

"It is surprising to see animals thus treated

over them; and he considers that the large leaves knees, spring up to day and ron about with the

" It is necessary, however, to examine the convalescent daily, and repeat the liquid application, and if any excessive heat is discovered in a foot, it proves that the first operation has not succeeded

"The caustic remedics which I have found most effectual, are diluted oil of vitrol and aqua corulea. The latter in the state in which it is found at the apothecaries without any addition. The oil of vitriol I mix with three times its quantity of water or for cases of not long atanding with some thing more.

Mr R. H. Parkinson's receipt for the cure of Foot Rot.

A speedy and easy remedy for both prevention and cure. To prevent it, take lime from the kiln. spread it on the floor of a barn two or three inches thick, or in some convenient house, large enough to hold the flock likely to be affected. first cleansing the feet by paring the superfluous hoof, and with a sponge or old rag dipped in chamber lye, wash the foot clean, then let the sheep stand on the lime six or seven hours, if twelve the better. The cure, the same as above, but the parts affected, after paring and being washed with chamber lye, should have lime applied to the quick or wounded parts, rubbing it on, and leaving as much on the hollow or fore part as it will contain then let the sheep stand on the lime as directed above.

FATTENING SWINE, &C.

We are informed by Judge Peters of Pennsylvania, formerly President of the Philadelphia Agricultural Society, in a communication which appeared in the Philadelphia American Daily Advertiser, that "sour food is the most grateful and alimentary to swine. One gallon of sour wash goes farther than two of sweet. I mean the wash acidulated to the degree required for distillation, not acetous.

" Dry rotten wood" [kept constantly in styes for fatting hogs to eat at pleasure] is a good thing ; but I will take the liberty to mention what I think a better, we have three blacksmiths in this town; and my hogs eat up all the ashes or cinders they make; we haul it into the pens by cart loads, and the hogs will devour this at times with more avidity than their ordinary food.

Charcoal it has been said will answer a similar if not more valuable purpose than either cinders or rotten wood." If swine are supplied with a small quantity of coals, (according to a statement by an Ohio farmer,) say two pieces a day to each, about the size of an hen's egg, they will discontinue rooting, remain more quiet and fatten faster than they will otherwise. Charcoal will operate on the human frame as a cathartic, and, probably may have the same effect on the animal we are treating of. If so it may supersede the necessity of using brimstone, antimony and other drugs with which hogs are often dosed. At any rate it will cost but little to give them a constant access to between asparagus beds, and lete the vines run who were yesterday hobbling about on their place, and they will be induced by instinct to consume such quantities as will promote their health and expedite their fattening.

When you first commence fattening your swine care should be used not to give them more than they will eat with an appetite. If they become gorged or cloyed their thriving is retarded, and there is danger from staggers, and other diseases consequent upon repletion or the high living, to which these four footed epicures are addicted.

The practice in Scotland is to rear swine chiefly on raw potatoes, and to fatten them on these roots boiled or prepared by steam, with a mixture of oats, barley or bean and pease meal. troughs should be often replenished with a small quantity of food at a time and kept always clean and seasoned occasionally with salt. Mr Mar shalt,an eminent English agriculturist says " young pigs require warm meat [food] to make them grow. Corn (grain) and cold water will make them healthy; but warm beverage is considered as requisite to a quick growth." The same writer mentions another mode of managing swine, which may be worth attention. Some English farmers, he says, "keep two or three little store pigs in the fatting stye. While the fatting hogs are taking their repast, the little ones wait behind them ; and as soon as their betters are served, lick out the troughs.

"Besides the advantage of having by this expedient no waste, nor foul troughs, there is another. The large pigs rise alertly to their food, lest the small ones should forestall them; and fill themselves the fuller, knowing that they have it

not again to go to.

"The disadvantage of this practice is, I understand, the large ones are apt to lord it too much ever the little ones; especially in a confined stye. If however they had a separate apartment assigned them with an entrance too small or the fatting swine to follow them, this disadvantage would be in a great measure remedied.

An English farmer fattened 8 pigs in the following manner, which may be recommended in cases where a constant and regular attention cannot be given to feeding the animals. He placed two troughs in the stye : one he filled with raw potatoes, the other with peas, and gave no water .-When the pigs were thirsty they ate the potatoes. In this way, it is probable, that the animals could not only do without water, but likewise needed no delicacy. brimstone, antimony, nor other medical substances, for raw potatoes are cooling and drastic; and might serve at once for food and physic. Instead of peas probably dry Indian corn, or what would be still better dry Indian meal might be substitut-

Rubbing and currying the hides of fatting hogs is not only grateful to them, but cooducive to their health and thriftiness. In every stye a strong post should be placed for them to rub against -They should have plenty of litter, which will be the means not only of contributing to their comfort, but increasing the most valuable manure.

The Complete Farmer says "when hogs are fattened entirely on acorns, chesnuts, and other productions of the forest, the flesh will eat much better and sweeter than if fatted in a stye. Some indeed say their fat will not be so solid nor so profitable, and therefore they commonly shut them up a week or ten days and feed them with dry peas; but this is a mistake; experience having shown that hogs, fatted with acorns only, have their fat as solid as those fatted with peas."

those of the English oak. In the United States, many, it also appears that it is indifferent whether the acerns of the white oak, and of the shrub oak would, perhaps, prove most valuable as food for swine. It might be well to try them, not only raw

Soaking corn for swine is no doubt a useful practice; grinding it still better. If a wash or mixture for swine be permitted to ferment till it becomes sweet with a little acid it will be the better; but it should not be suffered to become quite sour. Malting corn or suffering it to sprout increases its sweetness, and of course its nutritive

ON THE TRANSPORTATION OF FISH FROM SALT TO FRESH WATER.

M'Culloch, M. D. F. R. S. &c. was published in the Journal of the Royal Institution, London, and lacts relating to its objects.

The writer alludes to a former communication on the transportation of fish from salt to fresh has succeeded in adding many more to the list; the question of economy, the success has been far greater than any one was willing to believe.

"It is certain that the flavour of every fish which has yet been tried has been improved, and become the food of others. Many would breed, I can vouch for the superiority of the basse, the mullet, the loache, the alewive and the sole, from the pond, to those from the sea. This might be expected, for it is what happens notedly with respect to oysters.

"The sole becomes twice as thick as a fish of the same size from the sea, and its skin also becomes extremely dark or nearly black.

"The plaise also increases materially in thickness, and loses its spots. In some cases, it apbasse also turns much thicker and improves in

"The mullet almost ceases to grow in length, but enlarges in breadth, and presents a much deeper layer of fat.

"Crabs and prawns have found their own way into the pond, as have leaches, and some other small fish; and while formerly, there were none of the former two, the water is now absolutely swarming with them. Thus also, apparently, the eels have multiplied; as it is now easy to take a cart load at once, where formerly a dozen or two was a large capture.

"Oxygen is much more easily disengaged from fresh than from salt water. Consequently, the act of respiration ought to be easier in the former than in the latter; and therefore it is not to be presumed, as it has been, that sea-fish cannot respire in fresh water.

The writer adds the "Prospectus of a plan for preserving and rearing fish for the London market," from which the following are extracts:

"From various observations and experiments, of which evidence is subjoined, it has been found that sea-fish will live and thrive, and also breed as is the case in nature.

The acorns here recommended are probably in ponds and enclosures; and with regard to the water is salt or fresh, or brackish, or alter nately fresh and salt.

"It is also found that they may be fed in such but steamed or boiled, and likewise ground into inclosures, if necessary, as our domestic animals meal, and given with as well as without other mix- are; but that if sufficient numbers and kinds are placed together, they feed each other without requiring further care.

"It is further observed that every, or almost every species, improve in flavour and quality, as ovsters are known to do, under transportation.

"It is well known that, of all the fish brought to market, a very small proportion is in good condition, the rest being apparently ill fed; and hence the number of bad fish so well known to fish-mongers.

"It is much better known that, from bad weather, or other causes, the supply of the market is very An interesting article on this subject, by J. irregular. Thus the public suffer when the supply is short, and the merchant when there is a glut.

"The proposed plan, if executed, would bring republished in "The Boston Journal of Philosophy the fish within our own power to be taken alive and the Arts, vol. iii. page 31. The following when wanted, and from being better fed, in greatabridged view of the contents of this important er perfection, and more uniformly good. It would paper, will, we believe give most of the material be like taking stalled oxen instead of wild Scotch cattle.

"The plan is, to enclose, in any convenient part of the Thames (since the quality of the water water, and says a "Mr. Arnold, who has carried is proved to be indifferent,) a snace sufficient for on these experiments, at my wish, with great zeal, the purpose. A dock, or an excavation in the nature of one would be unnecessary, as the water and, both in respect to the physical fact, and to itself, in many places not navigable might be enclosed by a palisade. In this the fish would be received from the fishermen, by means of wellhoats alive. Those which chanced to die would as they have been found to do, and thus also produce food. But they might also be fed by means of butcher's offal, or other matters easily procured in a great city, as was the practice with the ancient Remans. From the enclosure, the fish would be taken by nets, the kinds in demand and the quantity selected, and the bad returned for improvement.

"With respect to fresh waters, we have evidence of the power of keeping and improving fish peared three times as thick as in the sea. The in them from the practice of the ancient Romans. From the testimony of Columella, and the other writers, " de Re Rustica," [on Rural Economy] it was the practice of the Roman farmers, in the earliest days of the Republic, to go down to the sea and bring up the spawn of sea fish to the fresh waters of Rome, where they multiplied and improved. It was a branch of farming. It became the amusement and luxury of the rich and great in the times of Imperial Rome.

"Lastly, this plan has been recently put to the test under the direction of the writer of this note in Guernsey, by Mr. Arnold. In a pond of about four acres only, many sea fish are now thriving, and all those which have had sufficient time have propagated; all have improved in quality and many very remarkably. This pond was at first worthless, containing only a few cels; at present it produces a large rent, and can supply the market, when the weather prevents the boats from going out. It is remarkable also, that since the introduction of the sea fish, the eels have multiplied a thousand fold, so as themselves to form a considerable revenue. This proves that fish may be fed merely by bringing different kinds together,

A scientific friend of ours, who has recently returned from a journey from Boston to the interior parts of New-Hampshire, informs us that the Cusk, a sea water fish, has been introduced into Winnipissiogee Lake; and is now quite frequently caught by angling .- EDITOR N. E. FARMER.

RIPENING GRAPES.

It is stated in the Transactions of the London Horticultural Society, that Mr. Thomas Fleetwood, of Dunnington near Alcester, hastens the maturity of grapes on open walls by the following method. Before the vines are out of flower, he brings each branch into a perpendicular position by a thread attached to its extremity, and fastened to a nail in the wall, carefully confining the young branch with the bunch thereon as close to the wall as possible. Fixed in this way, they ripen a month carlier than when left to hang in the usual

THE COW TREE.

This tree, which has been named Galactodendron, and appears to belong to the family of Sapoteæ, grows on rocky declivities on the northern Andes. Its leaves are large, oblong, thin, dry, and coriaccous. " Its thick ligneous roots scarcely enter the rock; for several months in the year rain scarcely waters its fan-shaped leaves. The branches appear dry and dead. But when an incision is made in the trunk, a sweet and nutritious milk runs from it. It is at sun-rise that the vegetable liquid runs most abundantly. Then the natives and negroes are seen to come from all parts provided with vessels to receive the milk, which becomes yellow, and thickens at the surface. This vegetable milk possesses all the physical properties of the milk of animals, only it is a little productive of a perpetual verdure and supply of thicker, and mixes easily with water. When fresh herbage unknown in artificial pastures, boiled it does not coagulate, but a thick yellow consisting of one or two species of plants only. pellicle is formed on the surface. Acids do not form with this milk any coagulum as with that of the cow."-Humboldt, Voyage aux Regions Equinoxiales du Nouveau Continent, lib. v. chap. 16. p. 263 and 264.

THE GRASSES. By Mr George Sinclair.

BIGNONIA CATALPA.

This is a native deciduous tree of the United States, covered with a smooth brown bark; the flowers are produced in large branching pinnacles, towards the ends of the branches; they are of dark white, with a few purple spots, and faint stripes of yellow on their inside. The flowers The branches dye wool a kind of cinnamon color. THUNBERG mentions that the Japanese lay the leaves on parts of the body affected with pains; and that a decoction of the pods is esteemed serviceable in the asthma. Poultry are very fond of the seeds, and thrive on them. The timber of the catalpa tree, makes very durable fence posts.

SALES OF MANUFACTURES.

The third semi-annual Sales of Manufactures of the United States, under the patronage of the New-England Society, commenced Tuesday last, in the spacious Halls over the City Market. The Exhibitions were very numerous and splendid, and purchasers apparently filled up all the places not occupied by lots of Goods. Of the company were many Gentlemen from New-York and other places. The sales of yesterday were principally of Cabinet Furniture, looking glasses, elegant time pieces, hats and other articles. The sales of cotton, woollen and other dry goods took place on Wednesday last. The samples, although not so heavy as on former occasions, are, we are told, of finer fabrick, and greater variety .- Centinel.

RAIL ROAD.

The Commissioners of the proposed Western [30 miles] with the survey, and find only a rise of 27 feet to a mile, which is little impediment to the facility of travel on a Rail way-besides which the descent is regular from W. to Boston, and the downward transportation may be two to one of the upward. The citizens on the route assist the Commissioners all in their power, and have the most liberal views, and the Commissioners devote every moment to the discharge of their duties.

One of the Committees on the proposed Hoosack Canal has reported that four towns on the

History of Louisiana .- The New Orleans Mercantile Advertiser contains a favourable notice of Martin's History of Louisiana, the first volume of which is lately published. This volume brings the history of that territory down to the period when it was taken possessiun of by Spain, in 1769.

LUCERNE. (Continued from page 32.)

Of the preparation of the land for Lucerne.

At whatever season you sow, the land ought to be rendered very fine by ploughing and harrowing, because all seeds buried under clods will never sprout. If you harrow after each ploughing, the labour will be less. It is not possible to prescribe the number of ploughings, because clear and net revenue for ten years, which demands much depends on the nature of the soil. The nature of the Lucerne root points out the necessity of deep ploughing. The duration and the goodness of a field of Lucerne depend in a great measure, upon the success of the first year; if the seeds do not come up well, if they are sown too thin, weeds will obtain the lead over the grass. If you sow Lucerne in the Spring, two fall ploughings will much facilitate your deep ploughing in the Spring; besides, the earth is admirably divided by the winter frosts. Winter is an excellent labourer. After the last ploughing, if the furrows are deep, you must harrow before sowing. Then sow, and harrow: first with the teeth of the harrow down, then with the flat side of the harrow, and so alternately till the seeds are well covered, and it would be well to attach a bush harrow to the harrow with teeth. [In general, these directions do not differ from our usual course in sowing clover and other grass seeds, and the same treatment which is adapted to clover will be proper for Lucerne, except that the ploughing should be as deep as possible.]-EDITORS.

Of the care required for Lucerne fields.

When the soil is adapted to the plant, and it has come up well, it requires no care. This remark does not agree wth the assertions of authors, who prescribe weeding as necessary to success; a precaution useless, an expense superfluous, if the Lucerne has not been sown too thin. I had scarcely, says the Abbe Rozier, chosen Languedoc frequent rains while making are very injurious to as the place of my retreat, than I began to sow Lucerne, and full of the ideas I had before acquired, I caused my fields of Lucerne to be regularly weeded. The peasants smiled at my care and solicitude. I asked them the reason of their ridicule,-the Lucerne, said they, will do part. For this reason it should be stirred as little more for itself, than you can do for it; let it alone, as possible in the middle of the day. Great care it will kill the weeds without your help. For this should be taken that the hay should be well cured, time they were right; the part of the field which was not weeded, was the next year as good as that which had been. After that, I was not so ready to throw away my money for nothing. The Abbe occupies some pages with the destructive the third is usually very good also, but in the effects of an insect, a Scarabæus, something like our rose bug, upon fields of Lucerne, but as we may never be visited with that scourge, we shall omit his remarks on this subject for the present.

Of the different crops of Lucerne in the same season.]

If you give credit to the assertion of an English writer, Mr. Hall, in other respects a writer of great merit, the southern parts of France have the advantage of making even seven crops a year. during winter. Unhappily for them it is not true, be the seasons ever so favorable, even when you have water at command and can water your fields at pleasure. If you cut the plant before it is in full flower, you obtain only a watery plant of little substance, and which loses three fourths of its weight in drying. It would, besides, afford but little nourishment, the results:

Supposing that the crop should be cut from the beginning to the middle of April, is it possible that the Lucerne should have time to flower seven times in the same season? It is rare, that we can have more than five crops. The ordinary number in the provinces, of which Mr. Hall speaks, is four fields which are rich, than on those which are crops. If the season shall have been favourable it poor and sandy. is a fine and rich product. No field yields numerically so much as a good Lucerne field. It is a no culture, no advance except that of preparing the land for the crop at first; the cost of seed, acre, or 400 square toises of Lucerne field, are of it. usually let for one hundred and fifty livres, or thirty dollars a year! Happy the proprietor, who has much land fitted for Lucerne.

Many persons affirm that Lucerne will succeed in any soil; if this assertion was as true, as it certainly is false, a great part of Provence and Languedoc would be covered with Lucerne, because natural meadows are very scarce in these provinces for want of water, but experience has proved, most decisively, that Lucerne requires a deep soil, not clayey, neither too stiff nor too sandy.

In the central provinces of France, Lucerne is cut three times in ordinary years, and four times in favorable ones; and from two or three times in the northern provinces. It is a general rule that Lucerne should not be cut except when in flower ; before that state, it is generally too watery, and its juices crude; after that period, it becomes too dry and too woody. Cattle should not be suffered to feed on Lucerne fields after the last cutting, nor during winter, when the ground is soft. The heads of the plants yield to the hoofs of the cattle, and injure the grass essentially. It is useful to pass a harrow over a field of Lucerne in the spring, and the crop will amply repay the expense of it. Lucerne should be cut in a cool dry time, and tended as rapidly as possible. Rains. this grass. Let it be cut under circumstances ever so favorable, and be perfectly dry, it-must not be carried in with the dew upon it, nor moved in the very heat of the day, because, in that case it is very apt to lose its leaves, which are the best otherwise it is upt to heat, and even take fire. The first cutting of Lucerne in any season is the least valuable, because it is apt to be mixed with other grasses or plants. The second is the best; fourth and later crops, the juices of the plant are not so rich, and of course are less nutritive.

Of the means of renewing the vigor and growth of Lucerne Fields.

Lucerne fields will wear out in time, but you may retard its period of decline by different treatment and manures. The first, which is the most prompt, convenient and cheap, is to feed your sheep upon it after the last cutting, and even

Mr. Meyer proposed in 1768, to employ Gypsum or plaster of Paris to revive and recruit old Lucerne fields, and communicated to the economical society of Berne, the several experiments he had made. These experiments were repeated by Mr. Kirchburger with care, and the following wers

- 1. That a quantity of calcined plaster, equal in measure, to the quantity of oats which would be required to sow any piece of land, is sufficient to manure it.
- 2. That gypsum succeeds better on Lucerne
- 3. That it produces a greater effect the first than the second year.
- 4. That it is less active in a moist soil than in a dry one.
- 5. If you sow the plaster as soon as it is possiand the wages of the mowers. One third of an ble in Spring, the first crop will feel the effects

Mr. the Abbe Rozier adds "I acknowledge according to my own experience, that plaster is very beneficial for Lucerne fields which begin to decline; that it facilitates in a great degree the growth of the large clover; that it is very useful in meadows covered with mosa."

The Abbe proceeds to recommend air-slacked lime, which he prefers to plaster. He notices, and approves a suggestion of the celebrated Duhamel, that when a Lucerne field becomes partially disfurnished by the death of some plants, to supply their place by laying the branches of the adjoining ones, which will take root; but it seems to us that a simpler course, which we have long since adopted with elover is preferable, which is, every spring to run over the field with a harrow, and throw in fresh seeds in the bare spots.

Of the value of Lucerne as Food.

Lucerne loses some of its value in proportion to its distance from its native soil; that is to say, it is not so nourishing, because its juices are more watery when grown in northern countries. Notwithstanding this no fodder can be compared to it in point of quality; none keeps animals in so high a state of flesh; none augments or increases the quantity of milk so much as Lucerne. These praises in all respects merited, require however some qualifications. Lucerne is heating to animals, and if you do not moderate the quantity in the hot season of the year, and especially in Southern provinces, horned cattle will become diseased. If you trust your labourers, they are so proud of seeing their cattle fat, that they stuff them with this food, and are unwilling to believe that it can be the cause of disease. I know but one mode of preventing the waste of Lucerne by your servants, and labourers, and that is to mix it in equal parts with straw, not in layers, but confusedly and generally mixed. The straw contracts the smell and flavour of the Lucerne; the animals eat it with pleasure, and are never injured by it. Lucerne given green to horned cattle or horses, is apt to purge them; for which reason it is a rule never to give it till it has been cut 24 hours. Care also is taken to give it in small quantities at a time, lest they should be hoven. This is not peculiar to Lucerne. The same effects are produced by green wheat, oats, &c. All pasturage which is too succulent is dangerous. In case this accident of being hoven should occur, an expedient which I have tried has never failed, (says the Abbe Rosier) which is to make them swallow an ounce of nitre (salt petre) in a glass of brandy, to empty the bowels of the animal, and to make him run. (To be concluded next week.)

Every thing respecting the Thames Tunnel is proceeding favourably.

The following is from a person long resident in some of them are drawn by women. Sussex, (Eng.) :- So great an effect has the most on the South Downs of Sussex, there is annually growths of from 3s. to 4s. per tod, even though the ewes from which it was shorn should have been originally equally good as to breed and staple. The experiment has, he intimates, been tried for several succeeding years, by the occupants of the farms alluded to having exchanged, each year, fifty ewes of the same age and quality, and the effect ascertained by the wool of one of the parcels of ewes invariably degenerating. Nor is this, he signifies, the only instance of the kind he has witnessed. Thin chalky land, covered with a finetextured turf, interspersed with wild thyme, small wild clover and eyebright, is that, he subjoins, which produces the finest wool. It is, indeed, a well known fact, that wool always becomes coarse, though increased in weight, from sheep being fed return in the same furrow. The plough commonon strong land. Hence it is that a Southdown ewe produces a fleece full a third beavier, though much coarser, the year she is fattened, than any one that preceded it.

THE PLOUGH.

was fastened to the yoke, and a handle was added by which the plough might be guided." Mr ancient medal dug up at Syracuse, which resemed to have its shape from the plough; in the most is boiled, hold each 150 barrels. ancient form of the Greek A, one branch (the beam) is twice as long as the other (the share.)in the form of a sharp toed-boot the holder (a female) has one hand on the top of the boot and a in one day, in this novel kind of dining room. instrument, now used for ploughing by the nations of the east, is similar to those of the ancients. times .- The Chinese ploughs are simple, and them for the purchase, remarked in his character-

The uncient Greek plough, described by Hesitrifling change of soil or herbage on the growth od, consisted of three parts-a long block sharpenof wool, that, on two farms adjoining each other ed at the point; a draught pole attached obliquely to the upper part of the block, and extending a difference in the value of their respective to the yoke; and a plough tail to direct the implement, fastened in like manner, and extended back. A plough of a similar construction is now used in Sicily. The plough of the modern Greeks has a crooked share, shaped like the claw of an anchor; it is only a continuation of the sloping handle, which is large and strong. . The most ancient plough used by the Romans, was of the simplest form. In the days of Virgil this implement had become more complicated and efficient. They had ploughs with and without mould-boards; with and without coulters; with and without wheels; with broad and narrow pointed shares. The beam was fastened to the yoke, like our cartpole. The Romans did not plough their lands in beds or ridges, as we do; but the cattle always ly used had no mould-board, and this may be remarked of the ploughs of most ancient, and some modern nations .- Hamp. Gaz.

A LONDON BREWERY.

An idea of the immense extent to which the This instrument has held the first place among brewing of porter is carried on in London, may the implements of agriculture in all ages. CULTURE OF SILK.

In a part of New England where the silk worm has been an object of attention for a longer time than in most parts of the country, the little German settlement on Ebenezer creek, in Georgia, excepted, some new modes of cultivating the mulberry are introduced. I am informed that several of the "seed farmers" sow their seeds broad-cast like turnips, in the spring, and in the following season cut the plants with a scythe as soon as the worms begin to ear out of the cocoons. This mowing is regularly prosecuted overy morning in the quantities wanted, and unless the season is one of severe drought, the fields will be cut twice or thrice before the worms begin to wind up.

The advantages stated of this mode are these:

1. The leaves are gathered with less labour and expense, being cut and taken together like hay or

2. The leaves are larger and more tender than on the grown tree, and the worms eat with more appetite and produce more silk.

3. The time of gathering the supply is so short that the leaves are got with the morning dew upon them, which is deemed by practical men, to be an essential advantage.

4. More worms can be supported from a given first cultivated on the banks of the Nile, in Egypt. vastness, this is one. It covers about eight acres space of ground, and the mulberries are ready after one season, instead of waiting several years for the formation of an orchard.

My informant who took pains to make minute inquiries on the spot, stated in one instance where the worms tended by one young woman, supplied with leaves in the mode described, produced silk to the value of \$400 in one season .- N Y. Times

OATS.

Great complaint, we learn, has been made in the of oats by blight. We are happy to say, that the farmers in this neighbourhood appear to be more tive) to an excess, thereby producing nervous disbent with the weight of the delicious harvests, in Nor is this goodly prospect likely to end in merc straw. On the contrary, as far as our inquiries and observations have extended, we have reason to believe that this species of grain, hereabouts, will turn out remarkably plump and heavy.

A failure in the crop of oats in a given section of the country is, perhaps, more severely felt than that of any other grain, because each section is accustomed to depend on itself for supplies, and operation, where the blight has fastened itself not on importations, as of other kinds of grain .-Vast quantities of oats are consumed annually at the livery stables, at taverns, and by stage proprietors; and it is thought that no other grain could be substituted for them, which would be equally convenient in its use, and equally healthy and pleasant for horses. It is estimated that the several lines of stages, which run from Boston to Albany alone, consume 100,000 hushels of oats in a year. The farmer never wants a market for this kind of grain, and there is no other crop which he

Terrapin .- There is now in the possession of Mr Seth Swift a large terrapin, taken from an island in the Pacific Ocean, and brought to this that, bearing a man weighing 250 pounds, it moves without the least apparent difficulty. The terrapin is a curious animal. None are more familiar with its habits and history, or have derived greater advantages from it as food, than the whalemen. It has often been known to live a year without aliment, and even then to be luxustantly he found himself at the bottom of the rious food .- Several islands of the Pacific abound steps. After having recovered in some measure with it, and the fishermen, after having been confined to their homely and monotonous fond, have enjoyed in a high degree the meat of the terrapin. Hundreds have often been taken on board a sintempt, wondering at this strange manner of pay- | gle ship, (in some instances weighing a ton each,) ing debts. Meanwhile the doctor had charged and daily been served up to the crew-a loxury the faithful conductor. No sooner had the sheriff which epicares would " delight to honor." Luxuries pall upon the taste, but the terrapin is an exception. Never can the terrapin, although ser-

> Effects of Ardent Spirit .- Two persons near Red River, in Louisiana, lately made a bet which should drink the greatest quantity of ardent spirit. A gallon of whiskey was procured, and they both commenced, drinking by turns the contents of a tumbler. The gallon in a few minutes went for more; but on his return found the other lifeless.

Origin of Diseases .- " I tell you honestly what I think is the cause of the complicated muladies of the human race; it is their gormandizing and stuffing and stimulating those organs (the digesanother grand cause; the fidgetting and discontenting yourself about that which can't be helped; passions of all kinds-malignant passions, and worldly cares, pressing upon the mind, disturb the brain, and do a great deal of harm."

"Lord Erskine," says Dr. E. Clarke, "told me that Barke's manner was sometimes bad; 'it was like that of an Irish chairman.' 'Once,' said he. I was so tired of hearing him in debate upon the India bill, that, not liking he should see me leave the House of Commons while he was speaking, I crept along under the benches, and got out, and went to the Isle of Wight. Afterwards that very speech of his was published, and I found it to be so extremely beautiful, that I actually wore it into pieces by reading it."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 24, 1827.

GARDENING.

The love of gardening is so natural to man, as to be common to children, and the enjoyments of a garden so congenial to our ideas of happiness as to be desired by men of all ranks and professions, who toil hard in cities, hoping, with Cowley, one day to retire to a " small house and large garden." The cares of a garden are a source of agreeable domestic recreation, and especially to the female sex; to the valetudinarian they are a source of health, and to age a source of interest : for it has been remarked of a taste for gardening, that, unlike other tastes, it remains with us to the latest period, and increases rather than diminish-

A statement appears in the last National Intelligencer of the health of Washington, the Capitol of the United States, compared with Baltimore, Philadelphia, New-York, and Boston; by which it appears that Washington is a very healthy city. The deaths there are said to be one in fifty, while in Boston they are one in forty-one-in New, York, one in thirty-seven-in Philadelphia, one in thirty-two; and and in Baltimore, one in thirty-eight.

From the 1st of Jan. to the 1st of Aug. 1827 15,000 arrived at Quebec-and probably 5000 at other northern ports-making over 30,000 emigrants to America in six months.

Thames Tunnel. A meeting of the share-holders of this institution was held, at the London read from Mr Brunel to the Directors, on the subject of the late accident. This contained a statement in detail of the difficulties, which had attended the undertaking, but expressed strong confidence in eventual success.

A company of merchants at Natches, Miss. has offered premiums of \$50 for the best sample piece was gone; and the person who proposed the bet of Cotton Bagging; \$25 for the best pair of blankets, and \$25 for the best of Denim for negro

Sutton Chasm .- In the town of Sutton, in Worcester county, is an immense chasm in the rocks, called "Purgatory." It is half a mile in length, from 75 to 100 feet in width, and the distance from top to bottom is 114 feet. A great number of apertures open in the bottom, by which one may descend to a still greater depth.

The vast walls on either side of the chasin are composed of solid granile, and on one of the highest points is a single rock which is estimated to weigh 500 tons. This rock corresponds with one on the opposite side, the two faces showing that they were once united, as do the faces of the perpendicular walls generally. There is granite enough here to build a city as large as Boston; and the distance to the Blackstone canal is only four miles. Ice is usually found in the chasm in all seasons of the year. The Worcester Ægis gives a particular description of this natural curiosity .- Hompshire Gaz.

Toby, about three miles northeast of Sunderland least I mile. This is stated to be the largest exvillage, has been described by President Dwight, and Professor Hitchcock. It extends quite through the mountain, and is 65 feet in depth, 12 rods in length, and from two to twenty fect in breadth .-It is formed by two vast rocks of pudding stone, which seem to have been originally united. At the top is an aperture called the window. Near the cave is a fissure 10 feet wide, 45 deep, and 130 long.—Ibid.

Good Beginning .- By an act passed the last session of the Assembly it is provided that the militia of Connecticut shall not be required to militia of Connecticut shall not be required to perform regimental or battalion duty oftener than once in two years.—Hartford paper.

| A new sum of the state of the public of the publ once in two years .- Hartford paper.

In the list of letters remaining in the post office at Cincinnati, (Ohio) we find the following; "Bernard M'Nelly, care of Robert Davis, 25 miles from Cincinnati, Jorsey settlement-or elsewhere.

" Knowledge is wealth .- In a neighboring county, a few days since, a man sold his horse to a stranger and received \$45 in Jersey city bills. Had he been a subscriber for either of the newspapers printed under his nose he would have learnt from it, in season, that this bank had broke. He has since subscribed, and paid in advance like a man."

A black man, who attempted to get into Mr Alexander Muirhead's Store at Cheraw, So. Ca. down the chimney, stuck so fast in the flue that they were obliged to pull the chimney down to extricate him.

We understand that Mr James Colburn of Dracut, has invented a composition which renders Shingles incombustible and much more durable. Many buildings in his neighborhood have already been covered with them. The price of the combence from that made in the nut mill, but there is much less sediment, I think not more than a quart or at most three pints to a barrel.

Dreen. Tiega County, Jume 12, 1827.

**Dreen and the shingles have a fine slate colour.

Caution to Farmers .- Mr David Merwin of Orange, last week lost seven fine sheep, by their getting into a field from which a crop of rye had been removed. These sheep died in consequence, as it is supposed, of feeding upon the grain which had shelled upon the field in harvesting.

St. Giles's Church in London, has now an illuminated dial; the clock, by its own revolution, highta itself as soon as the sun sets, and extinguishes the same when the sun rises.

Church and College endowments .- It gives us | Subscribers to the New England Farmer are ingreat pleasure to learn, that a series of articles formed that they can have their volumes neatly half from the pen of Dr Chalmors of the University of bound and lettered at 75 cents, which is as cheep as St. Andrew's, on the use and abuse of Church and they can be done in this city-by sending them to College Endowments, is appearing in Mr C. this office. Subscribers who began after the last Chalmers' Journal of Useful Knowledge, and that volume commenced can be supplied with the dethe first article was published in the number ficient numbers.

Authorship of Junius .- A correspondent of the Morning Chronicle writes, "A noble duke, in whose archives at Stowe this difficult problem has been at length solved, will greatly gratify the public by an early and authentic communication of the documents which now place it beyond doubt; and the communication will further instruct many modern writers on the theory of presumptive proof or pickling Cucumber, &c. with a new assortment of and the weakness of slight circumstantial evi-

TO THE EDITOR OF THE NEW ENGLAND FARMER.

SIR-I would thank ynn to publish in your paper the following notice. In June 1825 Joel Farnham took out a patent for a Cylinder Graer Cider Mill. I am now credibly informed that a man by the name of Constance H.Wicks, who lived in the neighman by the name of Constance H. Wicks, who have in the neighborhood, had frequently seen the above nill in operation, and has lately taken out a patent for one on the same principle, and has now employed agents to dispose of rights in the different New England States. The undersigned thinks it property of the property of the property of the same to reveal inspects people from purchasing the right. or to give this puloue notice, as he is interested, who are parentee, so as to prevent innocent people from purchasing the right of said Wicks, or his agents, thereby subjecting themselves to a law suit.

JOEL FARNHAM, Jr.

ADVERTISEMENT

Joel Furnham's Improved Cider Mill.—A mill on this plan of full size is 4 feet by 2.1.2. The cylinder is 16 inches diameter and 9 inches long, the periphery fixed, with points of iron or steel, placed in a spiral form, projecting 3-16ths of an inch, placed 2.36s of one eighth of an inch from each other, there height 17 rows around said block or cylinder, and 43 teeth in a row; the teeth may be 4d brads. The cylinder is put in motion by a whirl and band.

The mill winds band.

This mill without the power cost from 10 to 12 dolls.; and by giving it 500 revolutions per minute it will grind or grate with one horse power sixty bushels of apples per hour; with two horses doubte the quantity. The apples are grated very fine without breaking the seeds.

There was rising of two thousand barrels of cider made in

one of these mills last year, without expending one cent for repairs. Agents will shortly be out in the state of Massachusetts pairs. Agents will snortly be out in the state of massinguisetts to sell out the rights of towns, counties, &c.

Applications, post paid, directed to JOSEPH F. WHITE, No. 213 Water St. New York, or to JOSEPH R. NEWELL,

omego, Tioga County, June 12, 1827.

We the subscribers hereby certify that we have made cider al Joel Farnham's cider mill, at his dwelling place, in Tioga town, and with his Grater Cider Mill, and it will do the work complete as the above given by Mr Leonard.

G. L. TALCOTT, J. M. QUIGG, R. BROWN, E. TALCOTT, Jr.

This certifies that I have one of Joel Farnbam's patent cider mills, and it will grind from one and a half to two bushels of apples in a minute; it will grind a bushel and a half without any urging, but if urged it will grind two bushels, and the cider is perfectly clear and pleasant when well worked, and I think it will make more cider than any of the old fashinned mills.

SACRED LYRIC.

BY JAMES EDMESTON, LONDON.

Where can I go from Thee! All present Deity! Nature, and Time, and Thought, thine impress bear; Through earth, or sea, or sky,
Though far afar!—I fly,
I turn, and find Thee present with me there.

The perfume of the rose And every flower that blows, All mark thy love, in clusters of the vale.

The corn that crowns the fields.

The fruits that garden yields Proclaim the bounties that can never fail.

The vapour and the cloud, The thunder bursting loud Speak of Thy majesty in words of flame ; The ocean as it roars,
Lashing the rocks and shores,
Declares from what a mighty hand it came.

The vasty globes that roll, Each on its own firm pole, Through all the boundless fields of space alone.

Prove that indeed Thou art, The life-wheel and the heart, Of systems to our little world unknown.

From Thee I cannot fly; Thine all observing eye, Marks the minutest atom of thy reign; How far so'er I go, Thou all my path wouldst know. And bring the wanderer to this carth again

But why should I depart?
'Tis safety where Thou art; And could one spot thy being hold, I, poor, and vain, and weak, That sacred spot would seek,
And dwell within the shelter of thy fold!

FISH PONDS.

These are considered to be no small improvement of watery and hoggy lands, many of which can be appropriated to no other purpose .-In making a pond, its head should be at the lowest part of the ground, that the trench of the floodgate, or sluice, having a good fall, may, when necessary, speedily discharge the water. The best method of securing the work, is to drive in two ment was informed lately that one of his men had or three rows of stakes, at least six feet long, at run his sword through his body. On enquiry he a distance of about four feet, extending to the found that he had sold his sword to buy spirituous whole length of the pond-head, the first row of liquors. which should be rammed not less than four feet deep. If the bottom be false, the foundation may be laid with quick-lime; which, slacking, will make it as hard as a stone. Some persons place to wit Tuesdays and Thursdays. a layer of lime, and another of earth dug out of the pond, among the piles and stakes; and, when these are well covered, drive in others as occasion may require, and ram in the earth as before, till he pond-head be of the height designed.

The dam should be made sloping on each side, and a waste left to carry off the superabundant of the Fr. Chamber of Deputies. The General is water in case of floods or rains; the depth of the nond need not exceed six feet, rising gradually in shoals towards the sides, in order to allow the fish to sun themselves and deposit their spawn. Gravelly and sandy bottoms, especially the latter, are well calculated to promote the breeding of ably are published all accounts of duels-ruins these animals : and a fat soil, with a white rich water, such as the washings of hills, commons, cidents from intemperance, &c. &c. streets, sinks, &c. is said to be the most proper for fattening all sorts of fish.

account of its delicacy, quick growth, and prolific nature, as it breeds five or six times a year. This fish delights in ponds that have marl or clay bottoms, with plenty of weeds and grass, on which ed; then one every morning till the whole is it chiefly subsists during the hot months.

ing singular method of furnishing a fish pond with a variety of fish. About the latter end of April, or the beginning of May, take the root of a willow that stands near the water side, and is full of fibres; wash off the earth which adheres to it, then fasten it to a spike, and drive it into a river or pond well stored with fish; they will speedily be induced to deposit their spawn or roe in the fibres of the root. After a few days, (in cool weather, perhaps weeks) remove the spike, with the willow root, from the pond, and convey it to that which you design to store, driving it to the depth of four or six inches under the surface of the water; and, in about a fortnight, a great number of young fish will appear. The root, however should not be left too long in the first pond or river, lest the heat of the sun animate the spawn, and disengage it from the root .- Domestic Encyclopedia.

Forgetfulness. A gentleman who had a short memory, wrote in his pocket book: "Mem.—to marry next Thursday." As a proof that this precaution was not altogether useless, Mr Bwho had married in the morning, went to bed at night in his usual lodgings. And it is related of Mr Harvest whose character is drawn by Bickerstaffe in the comedy of the Absent Man, that having appointed a day to be married, he entirely forgot it, and went a fishing.

A Wife .- In the new piece of Love and Reason, old General Dorlan is persuading Adjutant Vincent to marry, "She is an angel !" says the General: "I don't want an angel-I shouldn't know what to do with an angel," was the reply of the single hearted Adjutant. "She is all sweetness," rejoines the General : " So is a beehive." answers Vincent, "but it does not follow that I should like to thrust my head into it."

Swallowing a Sword .- The Colonel of a regi-

Each dose may be taken in a glass of In a late publication, we meet with the follow- any kind of spirituous liquor mixed with water.

TO THE FARMERS OF THE UNITED STATES

Gentlemen .- You have raised abundance, and a variety of forage for cattle, but there is one species of herbage of which the horse, the cow and sheep are particularly fond, and which is wonderfully productive; that to which I have reference is called Tares. It grows early in the spring, and should the grass crops fail, it is found to be an excellent substitute; cattle will soon grow fat by feeding on it. I presume the seed could be imported from England, it will grow on almost any soil-in the county of Sussex, I have seen hundreds of acres on the South Downs, where the mould has not been more than six inches deep. The farmers sow it and sell it to those that own horses and cows, oy the acre, half acre, or quarter; the purchaser mows it down and carries it home at his own expense.

A short time past, I was conversing with an English farmer, that had known well the value of Tares, and he told me that he should import the seed; a few bushels will sow a large quantity of land, and the seed should be preserved from the crop. The farmer that I alluded to died shortly afterwards .- N. Y. Daily Adv.

How to preserve ready made Coffee good for a con siderable time in bottles.

(Abridged from Count Rumford's Essays.)

The bottles having been made very clean, must be put into clean cold water in a large boiler, and the water must be heated gradually, and made to boil, in order that the bottles may be heated boiling hot.

The coffee, fresh prepared, and still boiling hot, must be put into these heated bottles, which must be immediately well closed with good sound corks.

The bottles must then be moved into a cool cellar, where they must be kept well covered up in dry sand, in order to preserve them from the light.

By this means ready-made coffee may be preserved good for a long time, but great care must be taken not to let it be exposed to the light, otherwise it will soon be spoiled.

An Infallible Barometer. Put two drachms of pure nitre, and half a drachm of chloride of ammonia, reduced to powder, into two ounces of spirit of wine, or pure acohol, and place this mixture in a glass tube, ten inches long, and eight lines in diameter, the upper extremity of which must be covered with a piece of skin or bladder, pierced with small holes. If the weather is to be fine, the solid matter remains at the bettom of the tube, and the alcohol is as transparent as usual. If rain is to fall in a short time, some of the solid particles rise and fall in the alcohol, which becomes somewhat thick and troubled. When a storm, a tempest, or even a squall is about to come on, all the solid matters rise from the bottom of the tube, and form a crust on the surface of the alcohol, which appears in a state of fermentation. These appearances take place 24 hours before the tempest ensues; and the point of the horizon from which it is to blow is indicated by the particles gathering most on the side of the tube opposite to that part whence the wind is to come.

AGRICULTURE.

MILLET.

Mr. Fessenden-In Agriculture, as in all practical sciences, facts are much more important than theories; and it is the duty of every farmer to communicate the result of his experiments. A plain and exact history of his cultivation will be useful to himself and to others; and it would be well for him to remember that it may be as useful to record his failures as his successes .- I give you the history of a small Millet field.

The land is a moist good soil; and measures seventy-two square rods. It was planted last year with potatoes, very slightly manured with rock weed in the drills, and vielded a poor crop. It was manured this year with slaughter yard and barn manure mixed, at the rate of 25 cords and three fourths to an acre; that is 336 cubic feet of manure were put on the piece and ploughed in. It was sowed with seed obtained at the New England Farmer office, and rulled on the 14th June, at the rate of 5 pecks of seed to the acre. The field was moved on the 19th inst. and carried in yesterday weighing 3000 lbs. at the rate of 6900 lbs. to the acre. It was cut as soon as some of the seeds would shake out when rolled in the hand; and from experience heretofore, I deem it quite equal to my best English Hay for any Yours respectfully, kind of stock. Salem, August 25, 1827.

INSECTS.

MR. FESSENDEN .- With a view to confirm the facts, respecting the insect, which preys on the ent-worm, (partially described in the N. E. Farare made.

This season my plants were visited as usual, by the cut-worm; but not in such crowds, as in the last year. They however, succeeded in destroying many plants, until about the 10th of June. at which time, their great enemy, the cut-worm destroyer appeared, and in sufficient numbers to put a stop to further depredations. I had frequent opportunities of witnessing the prowess of this insect in the destruction of the larvæ, which prove so troublesome to the gardener.

These new insects are of different sizes, from half, to more than an inch in length. They are provided with 6 small legs, placed near the head. They are quick in motion, and their whole complexion is black. They lie just beneath the surtace of the earth. When this insect seizes a cutworm, that lies near the top of the earth, the exertions of the latter to disengage the assailant are such, as to bring both into view on the surface.

On the 12th of June, P. M. one of these insects of more than ordinary size was put into a glass vessel, and three cut-worms were placed with him. He not only killed, but nearly devoured them in the course of the afternoon. The next morning, the glass vessel was half filled with earth, and 14 cut-worms (none very small, some large) were put into it. They soon crawled into the earth. In the evening the earth was examin-

considerably caten. The next day he disposed of from their ravages. They are fond of flowers, the remainder in the same manner. He was then especially the flowers of the rose and grape, both kept fasting, and after thirtysix hours had clapsed, of which they soon destroy; and by them the ver a very large lurva of the earth-beetle (called, dure and beauty of a garden are laid in ruins. dorr-bug) was put with him. At first, he made some faint attempts to fasten on the worm, but is some variation, depending on the warmth of the did not, until forced by famine-he slew the vic- season. In 1825, they appeared on the 8th day lim, and feasted on the careass.

Mansfield, August 3, 1827. R. GREEN.

MR FESSENDEN,-Had not your correspondent suffered severely by the ravages of the insects, called rose-hugs, he never should have attempted the 3d of June, (weather warm, and dry,) and on an investigation of their habits and mode of economy. And now he regrets, that after much research, were more numerous than ever known before he is not able to present you with something, that The weather was very warm, the thermometer at might prove an effectual antidote.

Mansfield, May 28, 1827. R. GREEN.

REMARKS ON THE SCARABÆUS ROSE-US, OR ROSE-BUG.

The writer will not trouble himself, nor the reader with vague opinions, as to the origin and final exit of the insects in question; but bring into view such facts as have come under his observation: neither has he a wish to trespass upon the province of the entomologist; but from several considerations, having seen no specific name by which they are called, he is disposed to depart from the path generally pursued, and call the insect, Scarabæus Roseus, a name sufficiently sigmineant for his purpose. If others prefer a different name, they are at liberty to select, and to make use of what they please. The insect, however, belongs to the Scarabæns family, in the ormer, page 313, vol. 5th.) the following remarks der, Coleoptera, according to Linnæus. More modern entomologists have subdivided this family or genus, and given different names to the subdivisions, but facts are the same.

An individual rose-bug is unimportant, otherwise than it regards science, but collectively they are a potent enemy, and unavoidably arrest our active, but in a cool one, especially if it be wet, attention, especially, when they assail us on all they are languid and move but little. About 9

and intrude on our persons.

These insects appeared in this vicinity some time during the revolutionary war with G. Britain They were first observed on rose bushes, and sally, called rose-bugs. At first, their increase six of these spoilers were known to infest a single they have of late years greatly increased, and hand. As the evening approaches, if it be cool, alarming. In many places their ravages were they feed and occasionally travel a small distance, clusion, that, if they should increase for two or rain the sun break out warm, they are very active. three years to come, in the same ratio, as they When shaken from a tree in the cool of the evenhave increased for the two years past, scarcely a ling, or at any time when they are wet with dew, green thing, on which they prey, would be left they fall on the ground and crawl to the tree, or unmutilated. They are voracious, especially when anything else standing near, and ascend, as they they first appear, and not very delicate as to their cannot under these circumstances make use of food. They prey upon many kinds of plants, their wings. In a scorching sun they seek a shrubs and trees, but especially on rose bushes, shady place, and frequently collect where there is the nice varieties of the cherry tree, grape vines, a cluster of leaves. When they settle on a plant, plum trees, apple trees and almost all kinds of shrub, or tree, they seem generally, disposed to young fruit as apples, peaches, apricots, nectarins, stay on the same, until they have destroyed the

stroyed 10 of the number, some of which he had and shrubs, not excepting the shrub-oak, suffer

As to the time of their annual appearance, there of June, and by the 12th, they were very numer ous and so continued for several days. By the 28th, the number was comparatively few and depreciated daily, ontil the 6th of July, after which none was observed. In 1826; a few appeared on the 4th, they were numerous. On the 8th, they 4 P. M. stood at 93° in the shade. In the garden of the writer, the atmosphere was literally alive with the insects, which from their great numbers made a general hum, similar to that of the swarming of bees. The wind was from the west, but the insects came from the east, against the wind. and none is recollected to come from any other direction. The fragrance of the garden, (there being at that time, many plants in flower) was carried by the wind to some distance, and un doubtedly invited them there. They were very numerous for several days, but by the 24th, they were less so, and decreased from day to day. By the 9th of July very few were seen, and after that time only an individual was now and then observ ed, the none after the 21st appeared. The coef weather and rains in the latter part of June, and the beginning of July, undoubtedly, protracted their continuance. It is probable, that in other places, at some distance, there may be some difference of time as to their appearance and continuance, depending on local circumstances.

They are greatly influenced by the state of the weather. Their progress is accelerated by heat, and retarded by cold. In a warm day they are points, our interest, our comforts, our pleasures, o'clock, A. M. in fair warm weather, they begin to move from place to place in quest of food and company, of which they seem excessively fond, and by 10 A. M. or before, they are found in pairs, and frequently collected in great numbers, from from this circumstance they were, almost univer- 2 to perhaps 20 or more on a single leaf. Eightywas slow, and the injury done was small; but rose bud, and were crushed with one grasp of the their depredations have been great, extensive and they become still, but if the night be very warm, such the two last sensons, us to warrant the con- but do not make use of their wings. If after a ed; and it was found, that the avenger had de- &c. Indian corn, beans, clover, many forest trees foliage, and then resort to others. They may not

tion, and others a different kind. However, be this as it may, they are, when they first appear, emnivorous, having taken no food during the chrysalis state.* They do not prefer the foliage of the peach tree, nor that of the pear tree, but will occasionally feed on both. In 1825 they destroyed the foliage of a thrifty mountain ash, and essentially injured it; but in 1826, they scarcely noticed it. In a few days after their first general appearance, especially if the weather be cool, they seem to be less numerous, but this is, perhaps, not the fact any farther than they may be destroyed. At this time they become more stationary, probably devour less, leave some plants or trees and assail others, yet the work of destruction goes on.

The leaf is an impertant organ, and when a tree is stripped of its foliage in the month of June, unor at least declines. In my garden stood a number of young, promising cherry trees, which had been inoculated. They were assailed by the ravagers and robbed of their foliage-debility and decay ensued-a few, however, aurvived this shock, and put forth leaves the ensuing spring-but a new crop of intruders came, and it was fatal.

These insects, like many others, pass three different stages, the egg, the larva and the chrysalis, before they arrive to the mature or perfect and will be now attempted.

These insects in their perfect form are nearly the middle of the body, which is covered with a crustaceous substance, overspread with minute pointed bristles of a light brownish yellow, only conspicuous under a magnifier. There is but little difference in the general appearance between the male and the female, excepting the latter is a little larger than the former. The posterior segment of the body, or apex of the males is longer and larger than that of the female, and the dark line dividing the apex from the other part of the body is most conspicuous in the former.

The head is flattish and the eyes are black, prominent and immevable. The antenna are beautiful organs, (viewed through a microscope,) jointed, moveable, small at the articulation, near the eyes, and at the extremity, an oblong club, which is divided longitudinally into three portions. These portions the insect opens and shuts horizontally, at pleasure, when moving from place to place.—The thorax is broad, hexagonal and convex. The elytra (wing-cases) are divided by a straight longitudinal suture, covering the back, leaving the posterior part naked. These are articulated to the anterior part of the back, and are raised up, as on a hinge, to admit the expansion of the wings. The scutellum lies between the superior parts of the elytra, and is in form triangular .- The wings are two, and lie directly under the elytra, folded up by the nicest articulations. membranous, transparent, and show some light shades of red and green in the sun. When unfolded, they extend beyond the length of the body. The abdomen is formed of annular segments, and contains the viscera. The legs are six, long and well jointed, formed of a crustaceous substance of

Some may prefer one kind of vegetable produc- joints. Each tibia is armed with dark thorns, and each tarsus has 5 joints, furnished with thorns, and at the extremity, two curved claws. The two the thorax, the two middle ones, to the unterior and under part of the abdomen; and the two posterior which are longer and larger than the others, to the under and central part of the same; and their backs.

They, like most other insects, are oviparous, and deposit their eggs below the surface in moist. light earth, and in grass land. The depth of deposit is from near the surface to 3 or 4 inches, according to the state of the soil. The eggs are before the dew falls. about one thirtieth of an inch in diameter, white, contained in a transparent membrane, of sufficient less it be otherwise healthy and vigorous, it dies, strength. When they have performed their last work, which is the preparation for a new crop, still more numerous, they, both male and female, in a short time, perish by exhaustion, some in the earth and some above it." With respect to the time make excellent pies. For this purpose it is a great when an individual deposits her eggs, there is some variation. Some perform this office sooner than others; but from a variety of experiments made by placing the insects, male and female, in pots of earth, kept moist, covered with millinet, fed and expessed to light and proper heat, and the state. A general description may be necessary, frequent inspections of the bodies of the females, carefully made, it is thought, they generally perform that office in about 20 days from the time all of a size, about 4 lines in length and 14through they emerge from the earth, but in different places and at different times, occupying the space of 2 or 3 days, more or less. It is an unhappy circumstance, that they occupy so much time before they can complete their object. Time, however, is necessary for the eggs to become matured. If the body of a female be inspected soon after her emerging from the earth, the eggs will be found, by the aid of a magnifier, to be in a confused mass. After a few days they will be more distinctly seen, some more perfected than others, and as the period of oviparition approaches, the eggs approach to maturity. In about 20 days the eggs are matured, distinct, and a little oblong, but after they are deposited, become round, or nearly so. The number of eggs found in an individual have never exceeded 30, generally below twenty.

To be concluded next week.

FOR THE NEW ENGLAND FARMER.

ON PEACHES, &c.

Mr Fessenden-Among the luxuries which are the produce of our climate, the peach is one of the most valuable, but, in years of great abundance, as the present is likely to be, large quantities of the liquor may be decanted clear and sweetened this delicious fruit are suffered to go to waste on with white or loaf sugar. It will improve by age, the ground, or even prostituted as food for swine. I wish to invite my brother farmers to lay by, in reserve for another year, the superabundance of the present season, which may be done by drying in the sun all the fruit which they will not be able for cabin use in long voyages. to dispose of to advantage.

In plentiful years, none but the finest will pay for marketting; and many fall and get bruised .-This refuse fruit I invite them to dry, which may he done by splitting, taking out the stones, and exposure to the sun. The day after they are put

all have an equal relish for the same kind of food. a reddish yellow, or light chesnut colour, blackish out, and have got wilted, the work of dessication may be considerably advanced by pressing the out side of the pieces with the finger, so as to push out the inside, and thus exposing it better to the anterior legs are articulated to the under part of effect of the sun. They may be laid out on milk pans or pieces of boards, but if the quantity of fruit to be dried be considerable, I have used with much convenience dryers constructed as follows. I have taken pine slats about one inch square, and nailed with the two last named, they have, when disturb. on them shingles, so that my dryers are the width ed, a contemptuous motion of throwing them over of the shingles, and about four feet long; refuse shingles answer the purpose very well, and they may be nailed on with cut tacks: these dryers have the advantage of lightness and cheapness. and they are quickly made. They may be laid on the roof of a shed, and should be housed at night,

> If the weather comes on wet, the fruit will be liable to moulder; in that case, it must be finished in an oven heated moderately. Peaches well dried in this manner, will keep in paper bags in a dry room, and he good the third year.

> They are a luxury as a dried fruit, and will also improvement to soak them in a little water, or yet better in current wine, 6 hours before they are wanted for baking.

PEACH WINE.

The refuse fruit may also be used to good advantage for the making of wine, which I have done in the following manner. After taking the stones out, the fruit should be well mashed with the hands, thrown into a boiler with a sufficient quantity of water, well boiled and kept mashed so as to get it to yield its juice. When boiled enough, it should be worked through a sieve to get the liquor as clear as possible; and for that purpose the sieve should be often washed in cold water. Add they good Havana sugar enough to have it pleasant, and let it rest twelve hours for the sediment to settle at the bottom; and to the clear liquor add of good brandy 2 or 3 quarts for a barrel-then barrel it, and bung it down. This is of the nature of the French boiled wines, Vins cuits, Vins de liqueur, and if well managed is a most excellent wine, both for its great substance and its superior flavour.

LIQUOR FROM THE STONES.

The stones may be used for the making of a liquor which will be found equal to the best imported Noyeau. They should be broken immediately after being taken out, and whatever of the fruit adheres to them should be left on. The almonds which they contain should also be bruised. and both shells and almonds then put into a demijohn, or other vessel, until it is two thirds filledthen filled up with good brandy. After six months

There can be no doubt but the dried fruit, the wine, and the liquor would be made welcome to a ready and profitable market in the City, and that the dried fruit would be particularly well adapted

With much estcem,

Your friend and serv.t. J. M. G. Weston, August 27, 1827.

REMARKS .- To the above judicious article we add the following from the New England Farmer's Almanack, (advertised in this day's paper). The article is written by a gentleman in New Jersey, and describes his peach house:

He has a small house with a stove in it, and drawers in the

^{*} It is admitted, that they, on taking the "velt," the chrysatis state, carry with them all that is necessary for that state of seclusion; but eventually, their stores are exhausted by the astonishing process of metamorphosis, which is carried on, and they emerge from the earth with strong appetites.

^{*} At the time, when "taking leave of absence," they were found, male and female, 2 or 3 inches below the surface of the earth, and in one instance, sub copula.

sides of the trusse, tathed at the bottoms. Each drawer will hold dig through it; and leave digging where the botnearly half a bushet of peaches, which should be ripe, and not oeeled, but cut in two and laid on the laths with their skins downwards so as to save the juice. On shoving the drawer in, they are soon dried by the hot air of the stove and laid up,-Peaches dried thus eat like raisins. With a paring machine, which may be had for a dollar or two, apples or pears may be pared, and sufficient quantity dried to keep a family in pics, and apple bread and milk, till apples come again. With a paring muchine, one person can pare for five or six cutters.

ARTIFICIAL PONDS.

Pastures that are destitute of water, should have artificial pends made in them, for watering places.

" Observe where rushes, reeds, flags, and other aquatic plants grew spentaneously; or where frogs are observed to lie squatted down close to the ground in order to receive its moisture. Or soil .- Deane's New England Farmer. observe where a vapour is frequently seen to rise from the same spot. Some say, whenever little swarms of flies are seen constantly flying in the after sun-rise, there is water underneath."declivity is sufficient to give it a horizontal vent, it will be worth the husbandman's while to dig other conveyance, to carry the water acress the light soil, through which it might otherwise sink. There is no difficulty in making a durable pend in a clayey seil. Let a large hellow basin be made in such earth, and it will preserve the water that falls in rain. But it is apt ly pernicious to the stemach. prevent it. The declivity, by which the cattle enter, should be paved, and gravel should be spread Or it might be better if the on the bottom. whole were paved.

There are many large natural pends, which have outlets in one part, and are supplied by brooks or rivers in other parts; but a greater number of smaller ponds which are perfectly stagnaut, unless when they are agitated by winds .-Such pends as the latter, in het seasons, are apt to become putrid, and contaminate the air about them. For this reason they should, if possible, be drained. And when the water is net deep, and an outlet can be made without too much cost, they should be drained for the sake of reclaiming the seil. This will be of great value, as it commenly is found to be extremely rich, being made up of the finest particles of soil, wafted into them by winds, and of decayed vegetable substances, besides the fine mould washed into them by rains.

Many farms centain little sunken spets, which are most of the year covered with water, and produce some aquatic bushes and weeds. These are notorious harbours for frogs; and are also called frog ponds. They should be drained if it be practicable. It is commonly the case, newever, that draining them in the common way, by making an outlet, would cost more than they would be worth when drained, because of the height of the land on every side. But in this case if the banks be not clay, they may be drained in the following manner.

Take notice on which side land that is lower than the pond is nearest. On that side, in the bank near the pond, dig a kind of cellar, two er three feet deeper than the surface of the pond; do it in a dry season. If a hard stratum appear, tom is loose gravel or sand. Then make an open or a covered drain from the pend to the cellar .-The water will be discharged from the pend, and soak into the earth through the bottom of the ellar, till a scurf is fermed on the bettem that stop the water from soaking into the earth. This scurf should be broken from time to time, and taken away with a long handled hoc. Or, the cellar of the different towns, and examined by the Commay be filled up with refuse stones, which I think is preferable to the other method.

dry, a small ditch should be drawn round it, and the route is not yet fixed upon, and will not be, as thus gained will be rich muck, much of which may the purpose of making a more accurate comparibe carted away for manure; and common earth, son. It is however pretty satisfactorily ascertainer sand, may replace it, without detriment to the ed, that a Rail Way may be constructed between

BREAD.

The disease called dyspepsia has become so same place, and near the ground, in the merning general and obistinate in this city, as to constitute one of the most terible plagues with which for the lead that may be transported over the rest "If a well is made in a sloping ground, and the we are afflicted. There is scarcely one in five of it by one. From the summit of the route to among persons of sedentary habits, who are not Providence, the descent is gradual and pretty unimore or less affected by it. We have no doubt such a passage, and by means of pipes, or any the principal cause of its prevalence is the unwholesome nature of the bread in common usc .-This, like many other articles of food, has been favourable than was anticipated. The greatest quantity of water will be obtained refined till its nutritious qualities are almost dein this manner, because there will be a continual stroyed. For the sake of fineness and whiteness, given the Commissioners every possible facility the coarser, but more neurishing particles, are excluded from its composition; and it is wrought into a tough, dry, and indigestible substance, high-Fortunately for to be thick and dirty, if some pains be not taken to the health of our citizens, an opposition line of spirited manner, that the best route should be sesome extent in the baking business, has of late lected, whether it prove to be their own or some years been set on foot, for the making of what is called family bread. This, as it is not refined to death, may be eaten with safety. Another kind, and liberally in the undertaking, and no local jeat of which large quantities are now baked, called bran bread, and made of unbolted flour, is the only one proper for confirmed cases of the dyspepsia, many of which have been cured by the use of it. Though brown and coarse in its 29pearance, it is quite palitable .- N. Y. Mirror.

> Steam Boats .- In the summer of the year 1807, Fulton for the first time ascended the Hudson equal, if not exceed any thing of the kind. Its river from New York to Albany, in a boat propelled by steam. This was the first successful experiment of the kind ever made. In a letter that I e addressed to his friend, Joel Barlow, under date of August 22, 1807, Mr Fulton observes:

> " My steam boat voyage to Albany and back has turned out rather more favourable than I had calculated. I ran it up in 32 hours, and down in much lower price. 30. The latter is just five miles an hour. I had a light breeze against me the whole way, going and coming, so that no use was made of my sails." His boat was comparatively a rude structure, and his engine of small power. After a lapse of twenty years, we now witness numerous steam boats, capacious to an extreme, elegant in form inch in length, slipped into the treachea, or windand finish, and which, without much exaggeration, pipe. This took place about 9 o'clock. The dismight be called floating palaces. But in swiftness, as well as in elegance, the progress of improvement has been great. Instead of five miles an hour, they now run at the rate of ten or eleven. and, in some instances, twelve .- Alb. Arg.

> The Hop Duty (by which the product of the year is estimated) was stated to produce 95,000l. the child is now in perfect health.—Keene paper.

Boston and Providence Rail Road .- We understand that the Commissioners of the Board of Internal Improvement finished viewing the different proposed routes of the Boston and Providence Rail Road on Saturday last, and intend soon to commence the survey. For a greater part of the distance three and in some instances four, different routes have been proposed by the inhabitants missioners,-the most westerly passing near the Wrentham meeting-house, and the most easter-If the pend should not then become sufficiently by, near the Mansfield meeting-house. It seems discharge itself into the cellar. The land that is we understand, until some surveys are made for the two capitals, without a variation of more than 25 or 27 feet in the mile from a level, excepting a distance of three or four miles about the middle of the route, where in the transportation from Boston to Providence, two horses will be required form, and it seems probable that no extra power will be required in this part of the route, in either direction. The route on the whole, is much more

The inhabitants on the different routes have and assistance in exploring the grounds, and though those of each town and neighbourhood are inclined to think favourably of their own route yet they all agree, in the most liberal and public other. The people of Providence and Pawtucket express their readiness to co-operate cordially ousies or rivalships seem likely to throw any ob stacles in the way of the enterprise, the only competition as yet exhibited, being a generous emulain its favour .- Centinel.

NEW INVENTION.

Mr Nosh Safford of Springfield, Vt. has lately invented a Hydraulic Machine which bids fair to operation as a common pump is very easy and effectual, and leaves no doubt but it will be a pewerful instrument for throwing water. Their simplicity and ease of construction is such, that they can be afforded very low. One of the largest dimensions and up to all necessary power probably will not cost much over \$100, the smaller at &

SURGICAL.

A distressing case occurred last week, in the family of Mr Michael Metcalf, Jr. of this town .-One of the children, two years old, was playing with some kidney beans, one of which, half an tress of the child increasing, it became apparent in the afternoon, that suffocation would seen end the sufferings of the little innocent. The parents then consented that the operation of bronchotomy, cutting into the windpipe, should be performed. This operation, by Dr. Twichell, seven hours after the accident, was completely successful and

LUCERNE. (Continued from page 36.)

. After having completed the extracts from the Abbe Rozier on Lucerne, we met with an English work, which is still more full on the same subject; and as it would be well to put our readers in possession of so many facts, and of such a variety of authority, as wholly to satisfy their minds of the great value of this grass, we shall insert copious extracts from this English work, " the Complete Farmer," printed 1793.

Columella, an ancient writer, ealls Lucerne the choicest of all fodder, because it will last ten years, and will bear being cut down four, ad sometimes six times a year; it enriches the land able cultivator. "As to its duration, it will last will bear three cuttings and two feedings in a in which it grows, fattens the cattle fed with it, and is a remedy for sick cattle. Yet notwithstanding it was so much esteemed by the ancients, and hath been cultivated to great advantage in France and Switzerland, for many years, it has not yet found so good a reception in England as it justly deserves; [this was written 34 years ago] nor is it cultivated here in any considerable quantity, though it will succeed 25 well in this country, as in either of the last mentioned, being extremely hardy, and resisting the severest cold of our climate. [This is as true in Massachusetts: it is ses and sheep upon it. As there is no grass, Mr. Chatcauvieux of Switzerland, by planting hardier than Clover.] Mr Roque lays it down as a maxim from his own practice, that Lucerne will grow on any soil, provided it be not too wet, to rot the roots. The strongest land is however to hour; when made hay it is likewise the best for try. Mr. Chateauvieux found, that when the be preferred, and the deeper the soil, the better milk; wherever it is much cultivated they prefer thermometer fell to zero the Lucerne did not sufa fine tilth. The Lucerne should be sown broad-horses upon it, preferably to any other, without cerne. He says, that in order to ascertain how east, in fine weather, at the rate of fourteen corn; and they were fat and in fine order. It is far Lucerne may be worth the farmer's attention. with it, the Lucerne will be better. Lucerne may perly dried will make excellent hay. Lucerue of it. will not grow on newly 'sroken-up land; it must be tilled a year or two; potatoes make the best same in the United States. More than twenty profit of making dung all summer. preparation for laucerne. In Languedoc they sow years ago, same seeds were imported and sucweeds and other plants. In Normandy, whose clip_ate resembles that of England, they sow grain with it. When the plants are a year old it will its slow progress in the United States.] be proper to go over the ground with a large if there are any patches, where the seed miscarand turned in the same manner, or the leaves, fice of the New England Farmer.

The addition of a splendid of an unknown duration; for a good brick house ornament to the garden would recompense the care necessary to bring the Rhododendron from his forest bower .- National Ægis.

· BUILDING.

BY DR. MEASE OF PHILADELPHIA.

A very capital error in building in the United thin walls, is both cold in winter, and hot in summer; a hoose with thick walls just the reverse. To the N. W. and N. E, in particular, the walls ought to be three times the common thickness.

The opportunity here offered, cannot be omitted of bearing a testimony against the common but uneconomical, unhealthy and dangerous practice of erecting wooden buildings, particularly in cities. The evil, however, will correct itself. The frequent fires in Boston; the almost entire destruction of Savannah a few years since, and the dreadcent conflagration of Portsmooth, N. H. speak more forcibly than words, as to the propriety of abolishing the custom of building with wood. is to be regretted, that in the United States advo- larly interests us to repress in our citizens. cates for wooden structures are found. To such the following observations are offered.

By building of wood, much immediate as well as remote inconvenience, is to be expected; and certainly, however suddenly felt may be the comfort arising from an increase of despatch, the numerous considerations of perishableness, want of safety, and call for repairs, added to the reflection, that the public taste is, for the time, deprived of one great field of exertion, will very much weigh with an enlightened people, when once they become awakened to their advantages, and proud of the singular novelty of their physical

vallies: The laure! spreads along the hill sides, ble to all the langers of wind and fire, and is not mining upon the practicability and expediency of at one season presenting a wine random area may be added, the concideration, which will weigh adopted for such a work, passed through this

growth mentioned by Dr. Bigelow. It is found hind them, will build of brick, if they wish to Governor Clinton, enclosing a copy of the Reflourishing in a wood within the town of Leicester. leave monuments of kindness, rather than a rent-solve of the Legislature relating to the Survey, The leaves are broad, long, and of a deep green charge, behind them. A well-finished brick house, announcing to him the appointment of Commisto insurance, which in all populous places sooner or later takes place, it bears an analogy to policies on annuities, where one subject lingers unof case, taste, and duration, there can be no lesitation between them. The whole doubt in the mind of a builder rests in the competition between immediate convenience and the remote advantage will be habitable for centuries.

Considered politically, and in this government every citizen is on the watch of public happiness and political warfare, there is this good attending et, now cost £11. brick buildings; from durable habitations, in which more money has been spent, and more of the refined tastes gratified, an affection for the States is, the thinness of the walls. A house with soil is increased. A habit of thought arises, favourable to population: a greater proportion of money is thus realised. The great national fund of course is augmented, fixed to the soil and pledged to society.

The last and highest consideration is, that migration would be less easy, and not so common. were a finer spirit of building to prevail. the Tartars to build houses instead of wagons and tents, as Baron Tor says they still do, and as they ing an association for the encouragement of dodid when the Huns impelled the Goths against the feeble Roman empire, they would not rove, and their country might become a land of tillage .-The facility with which we may move, is a strong incentive to that leve of change which it particu-

Prolific .- An Irish lady now resident in Pennsylvania, was a short time since delivered of five children at a birth, but who unfortunately did not long survive .- The same lady before she left Ireland had five children at another birth, and twins while she resided in New-York; making twelve children in eighteen months. Had she resided in France under Napoleon, he would have pronounced her the ' first woman of the age,' and if we have many such emigrants the next Census of the United States must be wonderfully in-

The commissioners appointed to make a recon-

The Survey of the Commissioners is to be exand favour which may warrant the Commissioners n making, with the State of New-York, the informed that Governor Clinton has, in answer, with great cordiality signified his assent to the proposed Survey, so far as the Executive of that State is concerned; and that the success of this important undertaking, from its commencement to its consummation, will be viewed by him with great interest and high gratification-Wor. Yeom.

Nearly two thirds of the distilleries and brewers in and about Glasgow have given up business for the present, in consequence of the scarcity and dearth of malt, hops, &c. Malt has now become so scarce, that it is with the greatest trouble and inconvenience running about for it that it can be got, and it is as high as 52s. a bolt. Hops that at Martinmas could have been bought for £5 a pock-

What a contrast ?- In the spring of the year 1815 the editor of the Black Rock Gazette paid at the rate of \$5 a ewt. for transporting a printing press, and types from Seneca Falls to Buffalo in wagons, a distance of 116 miles. - Goods, by any considerable quantities, can now be transported from the city of New York to that of Pittsburg, a distance of about 575 miles, for a few cents over \$2 a cwt. including all expenses!

American System .- A meeting of the planters. has been called in Natches for the purpose of formmestic manufactures.

It may be useful to our fair readers to know that muffs, tippets and other articles of fur, which when put into any kind of wood or paper box or drawer, are so generally liable to injury from moths, if put into tin boxes, will remain for years uninjured.

A meeting of the officers of the Revolutionary Army bas lately been held in Baltimore, for the purpose of again memorializing Congress on the subject of the half pay which was promised to them in 1780. The Hon. Philip Reed, of Maryland, presided.

A company has been formed in N. York for the purpose of settling sugar plantations in Florida.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 31, 1827.

SOW WINTER RYE.

be the less apt to be laid bare by the heaving of have assumed their distinctive marks from having the ground by frost. In the Memoirs of the New York Board of Agriculture, vol. i. page 82, it is observed, that rye should be sowed the last week Essex white, &c. " in August or the first week in September, at the rate of about 36 quarts per acre, some say 48 qts. a man of accurate observation, having, in a piece But if not sowed at that time, it ought to be delayed until late in November, so that it may not come up till Spring. Mr A. Worthington had a good crop, which he sowed in a January snowstorm. Rye raised on upland makes much better separately. The produce was 15 ears, yielding flour than that which is raised on low or damp 604 grains of a strong bodied, liver coloured

Rye may be sown to great advantage for green fodder for cattle and sheep, particularly the latter, in the spring. When it is meant for this purpose, it should not only be sowed early in autumn, but These 604 grains were planted singly, nine inches should be sowed thicker than when it is intended to stand for a crop of seed. Some say that it may well be mowed for hay two or three times in the course of the summer, and this piece of husbandry is recommended for farmers, whose lands are mostly dry and unsuitable for grass.

The quantity of seed to be sown on an acre sowing, and the purpose for which it is intended. If it be sowed in the latter part of August, or beginning of September, and is intended to stand for a seed-crop, the quantity should vary from 32 to 48 quarts, according to the goodness of the soil. Later sowing requires more seed, and in some cases two bushels to the acre will not be too great a quantity. Bannister's Husbandry says " when improvement in a field of grain of the same nathis grain is sown for sheep-feed, it is proper to allow 3 hushels to the acre, for where the blade, haulm, or stalks form the primary object, a much larger proportion of seed is requisite than when the crop is meant for harvesting."

ON THE CULTURE OF WHEAT AND OTHER CULMIFEROUS PLANTS.

Culmiferous plants have two sorts of roots .-The first originate with the germination of the grain, and are always under the soil, and are called the seminal roots: the second spring from the first joint which is formed above the surface of the soil, and from that joint strike down into the soil; these are called the coronal roots. The coronal roots appear chiefly intended for drawing nourishment from the soil, the richest part of soils being on or near the surface. From these facts some important hints may be derived as to the culture of wheat, rye, &c. The use of stirring the surface in spring to facilitate the entrance of the coronal roots is obvious; the immediate effect of a top dressing is also apparent, and also that manures may be ploughed in too deep to give the full amount of their beneficial effects to grain far as to impregnate the stigmas; and having crops or grasses.

To procure new varieties of wheats, (says Mr Loudon,) the ordinary mode is to select from a field a spike or spikes from the same stalk, which has the qualities sought for; such as larger grains, thinner chaff, stiffer straw, a tendency to earli-

grains from such ear or ears, to sow them in suit- choice till a bushel or two of seed is procured.the produce is ripe, select the best ears, and from these the best grains, and sow these, and so on till a bushel or more is obtained, which may then You cannot sow your winter rye too early in be sown in a field apart from any other wheat. In September. If it be sowed early, its roots will get this way, many of the varieties of the common such firm hold of the soil before winter, that it will winter wheat have been obtained. Other varieties been long cultivated on the same soil and climate, and take local names, as the Hertfordshire red, matters and lime. The former has a direct influ-

> Marshall (Yorkshire) mentions a case in which of wheat perceived a plant of uncommon strength and luxuriance, diffusing its branches on every side, and setting its closely surrounding neighbors at defiance, marked it; and at harvest removed it wheat, differing in general appearance from every other variety he had seen. The chaff was smooth without awns, [beards or bristles] and of the colour of the grain; the straws stout and recdy .asunder, filling about 40 square yards of ground, on a clover stubble, the remainder of the ground being sown with wheat in the ordinary way; by which means extraordinary trouble and destruction by birds were avoided. The pruduce was two gallons and a half, weighing 201 lbs. of prime grain for seed, hesides some pounds for seconds. nated near a habitation; but by carrying on the the winter. ture, that inconvenience is got rid of. In this sit- to that of summer wheat on a great variety of acuation, however, the botanist will be apprehensive counts. It is sown and the ground prepared at a of danger from the floral farina of the surrounding season of much greater leisure. One of the great white wheat.

or pollen of the male organs of the blossom of another variety of a different quality. Thus, supposing a farmer wished to render a very good variety earlier. Let him procure in the blossoming senson, from a very early soil, some spikes of an early sort just coming into blossom, and let him put the ends of these in water and set them in the shade so as to retard their fully blossoming till the plants he has destined to become the females have come into flower. Then let him cut out all the male organs of the latter before they have advanced so done this, let him dust the stigma with the blossoming ears of the early or male parent. The im regnated stalks must then be kept apart from other wheats so as the progeny may be true .-When the grains ripen, sow the best, and from

able soil in an open airy part of a garden. When This operation has been successfully performed by T. A. Knight, and though it may be reckoned too delicate for farmers in general, it will be looked on by the philosophical agriculturist as not improbably leading to important results, as has attended the practice in the case of garden fruits and flowers.

The manures best calculated for wheat are allowed by all agricultural chemists, to be animal ence in supplying that essential constituent to wheaten flower, gluten; and the latter azote and lime, both actually found in the straw of wheat .-At all events, it is certain wheat will not thrive on any soil that does not contain lime. In this Sir II. Davy, Chaptal, Professor Thaer, and Grisenthwaite fully agree.

R. H. Gardiner, Esq. in some observations on the culture of wheat (originally published in the Hallowell Gazette, and republished in the N. E. Farmer, vol. ii. page 35,) says "all that I have sown on light soil, has looked well in the spring; but what was sown late, that is, after the middle of September, has been invariably struck with rust before it was ripe; while what was sown early has as invariably given a good crop. Most of my experiments have been made on green sward. After having I have selected a piece of ground which required ploughing, and generally of a light loam. I have ploughed it once and harrowed it twice or thrice, putting on between the should vary according to the soil, and the time of One grain produced 35 ears, yielding 1235 grains; harrowing, from 15 to 20 loads of manure to the so that the second year's produce was sufficient to acre, and sowing the seed before the last harrowplant an acre of ground. What deters farmers ing. I have always fed it in the autumn, believfrom improvements of this nature is probably the ing it would be less likely during the winter to mischievousness of birds; from which at harvest mould or die, if eaten close, than if left long on it is scarcely possible to preserve a small patch of the ground. I have found that the lighter the soil grain, especially in a garden or other ground sit- the less liable was the wheat to be destroyed by

"The cultivation of winter wheat is preferable crop. But from what observations Marshall has disadvantages of our northern climate is the exmade he is of opinion his fears will be groundless. treme shortness of our spring, so that it is diffi-No evil of this kind occurred, though the cultiva- cult for our farmers to complete the work, which tion of the new variety was carried on among is absolutely necessary to be done, after the frost is out of the ground, and before the season of But the most systematic mode of procuring new planting is ever. If therefore any work, as the varieties is by crossing two sorts, as in breeding: sowing of wheat can be postponed till the autumn, that is by impregnating the female organs of the it is of great importance. The winter wheat is blossoms of one ear with the fecundating matter less liable to injury from insects than the summer; mine has never suffered from them. It affords good fall food, and the larger quantity of roots and stubble to be ploughed in make the land in a betwhich he was in the habit of cultivating somewhat ter state for the next crop. The grain is heavier, and the same number of pounds will yield a larger quantity of flour, and of a much superior quality. For these reasons, it cannot be too strongly urged upon the attention of our farmers. From my experience I should recommend that winter wheat should not be sowed later than the middle of September, and the soil on which it is sowed should be a light loam, and that about five pecks of seed be sown to the acre. I have also found the use of plaster on wheat advantageous, as also rolling the wheat after it is well up. Winter wheat might probably do better after peas and beans than on. green sward."

An able article " on the cultivation of wheat in the produce when ripe, select the earliest and New England," written by Judge Buel, of Albany, ness or lateness, &c.; and picking out the best finest spikes for seed. Sow them and repeat the was published in the New England Farmer, vol-

v. page 217. Mr Buel is of opinion " that the soils of New England, being of primitive formation, are not naturally adapted to the culture of wheat, because they do not contain all the elements of that valuable grain. And that this natural defect can be remedied only by the application of animal manures, or manures containing the elements of animal matter. Animal matter must furnish the gluten which is the principal and most neurishing constituent of wheat. The elements of gluten exist in bones, urine, horn, hair, night soil, in the refuse of the tanner, morocco dresser, tallow chandler, soap boiler, the offal of the butcher, the dung of fowls, soot, wonllen rags, fish, &c. And the proper application of these substances, in sufficient quantities will ensure a crop of wheat."-See New England Farmer, vol. i. pages 103, 132, 178, 379, vol. ii. pages 28, 33, 41, 53, vol. iii. 353, vol. iv. 209, vol. v. 67, 217.

New England Furmer's Almanack, for 1828.

In press, at the New England Farmer Office, and will be Varmer.

TO THE PUBLIC.

Although, in general, we dislike prefaces, especially to short and ephemeral productions, yet, in the present case, some apology may be deemed necessary for adding another almannek to the great number which annually issue from New England presses. We were induced to this pruceeding by circumstances to which we shall briefly advert. As Editor and Proprietor of the New England Farmer, a paper devoted to Agriculture and Rural Economy, which has an extensive and increasing circulation, we have sources of intelligence, relative to improvements in agriculture and the useful arts, as well as means of distributing it, which the public good, as well as a regard to our own interest would seem to require that we should avail our-

Knowledge of that kind, which ministers to the necessities, comforts, acd conveniences of life, may, in the form of a small, cheap, annual publication, visit the fire sides and domiciles of many individuals, who cannot afford the mbney nor the time necessary to purchase and peruse the papers and volumes, composing the channels by which opulent intellect derives its mental treasures.

Should this year's New England Farmer's Almanack meet with the encouragement which our hopes lead us to anticipate, and present appearances promise, we shall issue it annually, as long as life, health, and circumstances favourable to its publication are granted by indulgent Providence.

THOMAS G. FESSENDEN. JOHN B. RUSSELL.

This Almanack, in addition to the usual miscellaneous matter pages of agricultural matter on the following subjects:

-on Charcoal-on Fish used as a Manure-on Gapes or Pip in Poultry-Agricultural Axioms-on Fallen Fruit-on Staggers in swine-How to raise Cabbages, which shall not be club-footed by Dr. Green of Mausfield, Ms .- How to Fatten Fowls-A cheap method of preventing the disagreeable smell of Privies -Root Steamer, with a drawing-on Grafted Trees-on Painting walls to Mature Fruit-on Cattle stalls-Signs of a good several days its effect was doubtful, if not dan-Farmer-on Drying Peaches-on the value of Time-Machines for gathering Clover Heads, with two illustrative engravings-Sir Astley Cooper's Chilblain Ointment-on the cultivation of from it. It appeared that the snake which attack-Turnips on a large scale, with a drawing of a machine for the purpose, &c .- Miscellagies.

This Almanack may be purchased, wholesale and retail at the following places. Of Bowles & Dearborn Booksellers and Stationers, No. 72 Washington Street Boston-O. D. Cooke & Son, Hartford, Con.-Holbrook & Fessenden, Brattleborough, Vt.-Isaac Hill, Concord, N. H.-John Prentiss, Keene, N. H -J. W. Foster and Childs & Sparhawk, Portsmouth, N. THE THAMES TUNNEL.

Yesterday (July 17) Mr Brunel made another report to the Directors on the steps taken for the cleansing of the Tunnel. It appears by it, that the entire upper row of apartments in the shield have been cleared of the mud, and the leakage through them is at present so inconsiderable, that a few men at the hand pump are able to keep it clear. The water in the extremity of the shaft next the shield has been reduced to four feet, and persons could walk into the Tunnel this day, to the length of 70 feet without wetting their shoes. It is expected that the work will be resumed by the end of next week. The instalments on the stock are paid with an alacrity that demonstrates published to-morrow, the New England Furmer's Almanack, for the utmost confidence of the Stockholders of the 1823. By Thomas G. Fessenden, Editor of the New England ultimate success of the undertaking .- Lond. pap.

> American Canvass .- The Phenix Mill Company have reduced their prices so as to furnish their canvass at the cost of Russian duck. The excellence of this canvass, which has been extensively used by the government, the Packet Lines of New York, and the New Bedford whale ships, is well established. Capt. Austin, late of the ship Panther, of Boston, states that in a situation where the American and Russian canvass had been exposed to mildew, the former were one quarter longer than the latter, and he has no doubt of its superiority in every respect. This article is for sale in any quantity, by Mr Joseph Howard, of this town .- Essex Register.

Bite of a Snake .-- A Mr Schuyler of this city had a number of men employed at mowing in his meadow, who met with a large black snake and killed it. When the workmen came home from the meadow they told Mr Schuyler that they had killed a snake of a very unusual size. Mr Schuyler enquired where they had left it, and proposed going to find it and bring it home. When he found the place which his informers had pointed out, he saw a snake and picking up a handful of hay stooped down to take hold of it near its head. The snake instantly seized the finger of Mr contained in similar works, will contain a Calendar of the Courts Schuyler, coiled itself around his arm, throwing for each state in New England; the Sun's declination; and 10 its extremity into his face and around his neck, biting very severely. Mr S. made several un-On Soaking Seed Corn in copperas water-on Small Farms' successful attempts to shake the serpent from his held; at length he put his hand upon the ground and bruised the head of the snake with the heel of his boot. In this effort he made the animal relinquish his fangs, and succeeded in killing it .-Mr S. was much affected by the wound, and for gerous. Nearly a fortnight has elapsed since the accident, and Mr S. has not yet wholly recovered ed Mr S. with such ferocity was not the one which the workmen had seen, but was probably its mate. It was of the common species of black-snake, and nearly five feet in length .- Troy Budget.

> 100 Saxony Rams were sold at Brighton on Friday last, and brought nearly \$3000-average

Cambridge Wit .- A gentleman of Cambridge College having a clubbed foot, which occasioned him to wear a shee upon it of a particular make, and with a high heel, one of the college wits called him Bildad the shuhite.

For sale at the New England Farmer Office, No. 52 North Market Street.

Lucerne or French Clover seed-Red or Dutch Clover-White Honyauckle Clover, and other Grasses .- White Onion Seed.

With every variety of GARDEN SEEDS.

Horse Rake.

For sale at the Agricultural Warehouse, One of Pire's patent revolving Horse Rakes One of Willis's patent Side Hill Ploughs, an excellent implement.

Medical Lectures-Boston. TIME CHANGED. Medical Lectures of Harvard College will begin the THIRL WEDSEDAY IN OCTOEFR, at the Medical College, Mason street, Boston. The time having been clanged from the THIRL WEDSESDAY IN NOVEMBER, when they formerly began.

WALTER CHANNING.

Aug. 31, 1827. 8t Dean of the Medical Faculty.

Miscellanies.

A WISH. Mine be a cot beside the hill. A bee hive's hum shall soothe my ear; A willowy brook that turns a mill,

The swallow oft beneath my thatch Shall twitter from her clay-built nest : Oft shall the pilgrim lift the latch, And share my meal, a welcome guest.

With many a fall shall linger near.

Around my ivied porch shall spring, Each fragrant flower that drinks the dew : And Mary at her wheel shall sing, In russet gown and apron blue.

The viltage church among the trees, Where first our marriage vows were given; With merry peals shall swell the breeze, And point with taper spire to heaven.

EPITAPH IN A COUNTRY CHURCH YARD.

Reader, pass on, nor waste your time On bad biography and bitter rhyme; For what I am this cumbrous clay insures, And what I was is no affair of yours.

THE GAME OF LOSING TIME.

the uncouth moralist.

I fear I should be an unwelcome correspondent if, on the subject of gaming, I should speak too much in the style of a philosopher. It would be a difficult task to persuade your readers that time is infinitely more valuable than gold: I have frequently heard players complain of the loss of the latter, but hardly ever the former. They have not elways in their recollection, what Dr Young has said upon this important subject.

Time destroyed Is suicide, where more than blood is spilt.

Dr Young's observations are very pretty, and in my present state of mind, very proper to be attended to. Be it known to ye, gentlemen, that I lost a thousand guineas in the course of yesterday evening; which has almost turned my brain, induced me to commence moralizer, and to congratulate myself on having done it in a few hours; since time is so highly estimated by the learned of all ages.

But, with all proper deference to their superior judgment, I had rather say, with Dr Johnson, that I have " only lost my time," than acknowledge to you, (as the fact is) that I have only lost a thousand guineas.

not in my perfect mind." Whilst I am penning greater quantity of flour than we export to all the this incoherent epistle to you, I doubt not but I am West India islands. Those states import, from still playing the losing game: Having lost my their sister states, more than 625,000 barrels a money, I am now staking my time, which must in-fallibly be lost, if you refuse a place in your very foreign export of flour was only 813,000 barrels

musician keeps it and beats it; the saunterer kills ing 200,000 for consumption, chiefly from Maryit; and the bookseller makes money by disposing land and Virginia, in the last year; and the latof an annual map of a small portion of it. Many ter, of itself, is almost equal to the whole export ladies lose time; and they would be extremely of the United States to the British West Indies happy if they could also lose the effects of it, for and Cuba-which, in 1825 was no more than 223, it behaves unmercifully rude to youth and beauty. | 000 barrels. AGRICULTURE.

FOR THE NEW ENGLAND PARMER.

FALL TARRING.

Mn Fessenden-I noticed in your paper of the 23d ult. a few observations on the subject of the Canker Worm, and the application of tar as a remedy. After stating that many persons had tried the experiment of the tar, and failing alto gether in the object of its application, have become skeptical as to its efficacy in preserving our orchards from the ravages of that destructive worm, the writer undertakes to point out the causes of this failure, and asserts from the authority of an intelligent cultivator, that the grab when it finds its ascent into the tree intercepted by means of the tar, deposits its eggs below; and by the time these become animated, and possess the power of locumation, the ordinary season of tarring has long passed by, and they ascend the tree over the dried tar without annoyance. Agreeably to this hypothesis, the writer recommends tarring very late, or at the season proper to meet the necessity of the case. Admitting the spring to be the only season in which they ascend the tree, the opinion of the writer is the only one naturally suggested to the mind, that accords with the fact of their escape-but it is merely hypo-

It is a well known fact that the capker worms ascend in the autumn as well as in the spring; and as far as my own experience extends, in much greater multitudes. In the summer of 1826 I had some canker worms in my orchard, but not so many as materially to injure the fruit, and last spring I applied the tar. I commenced as soon as apply it every day when the ground was not frozen, until none of them appeared in the tree. I I had ten times as many worms upon my trees as the year before. There was hardly a leaf in the whole orchard that was not devoured. To me this was inexplicable until a gentleman of my acmany as in the spring. Fully relying on the correctness of the account, I applied the tar to my own trees, on the first of last month. For the first two or three applications. I caught but few-but every night from the 4th to the 10th, when the mostly covered with them. There were but few nights, however, from the 1st to the 10th of the standing on the 16th but the following night being ter account than to throw it all to the hogs. seemed to preclude the necessity of applying it to recommend an experiment to my brother farm-cloth.

it rained and the wind blew heavy from the S E. As the pomace is pressed out, let it be thrown and nost of the night, the ground must have been into a heap, under cover, if possible. Perhaps a open to the escape of the canker wo ms. The corner of a eighty foot by twenty three eat b'ishnext morning I went into my orchard, and was ment might be spared, and let this laxor to farm indeed amazed at the view presented by my trees. Not only every particle of the tar was covered in such quantity, and at such intervals as not to with them, but the trunks and principal branches cloy, and cause them to loathe it. Especially let were nearly as much crowded as the tar. No system of tarring now in use, I am thoroughly convinced, would have saved my trees on a rising so andtitudinous as on that night. They had been enclosed in the ground for three weeks, almost the whole time of their ordinary ascent at that season of the year, and .when in common years the ground is open almost every night to their escape. I have always, however, caught most in stormy nights when the wind is at the S E. From all I can learn, I am inclined to believe that they continue under ground, after they enter it in the summer, not more than four months before they commence their return; and if we undertake to preserve our orchards by means of the tar, we must commence as early as the middle of October. and continue to apply it every day when the ground is not frozen, until some time in the following April But when the canker worms are so numerous as to destroy the whole foliage of an orchard, and the ground closed for ten or twenty days in succession during the season of their as cost, and suddenly opens, as on the 29th of last month, the common mode of tarring will not ans T. W.

Bristol, (R. l.) Dec 18, 1827.

APPLE POMACL.

Ma. Fessenden,.. l am conficen my the frost was out of the ground, and continued to farmer's plan, of Norfolk county, is by no means the most economical way of disposing of his ap ple pomace, though I may not be able to convince was pleased with the idea that few or none had him of it. I admire his separate apartments for escaped me. I was much deceived, however, for bogs, and his conductors to convey the water to them from his spacious cider-mill establishment; and, as food for his hogs, if dealt out in such quantities as they will actually consume. I have no objection to giving them their share of the pomquaintance of much intelligence, assured me that ace. But as it is evident that six or eight hogs they ascend in the fall; that he had applied the will eat but a small part of the pomace from two tar to his own trees at that season, and caught as or three hundred barrels of cider, I think there is great waste in giving them such a quantity. Fur indeed, what is not consumed by the hogs is almost wasted outright; because it contributes but very little to the value of manure, until it has passed through the hogs, or other stock, and beground was not closed by the frost, the tar was cause I am perfectly satisfied, from the observa tion of thirty years or more, that it is a valuable food for all ki ds of farm stock. There is nothmonth, in which the ground was not frozen too ing that domestic animals more greedily devour; hard for them to escape-and none, I believe from and in a scarce season for hay or grain, such a the 10th to the 20th I tarred my trees, notwith- quantity of pomace might be turned to much bet-

colder than I anticipated, none could escape from My farming establishment, I presume, is small, the ground. But the 29th day of the month was very small-compared with that of the Norfolk warm, and towards the evening a little range, and farmer; but I make, annually, a much larger pro-I observed the tar that I had applied on the 16th portion of manure, (I think) with a less number of was getting quite liquid and running down the hogs, without pomace; chiefly from weeds, and five cents per yard. Nothing is more absurd than bodies of the trees. This condition of the tar such kind of robbish. I will, therefore, venture the Southern fears, of paying dear for American

on that day, and I omitted it. The following night ers, which, on trial, I believe they will prefer stock be dealt out in due proportion to them all: poultry of all kinds be well supplied with it. I prefer them fatted on apple seeds to any thing else. And they fat very quick on them. Thus the grain may be all saved, that they would otherwise consume. For if it can be secured from waste, it will serve for their winter's food. And it will be at all times grateful to cattle, sheep and hogs, and save a proportion of their food, of much more value, I doubt not than the raw pomace in a mass to be worked into manure by the hogs Respectfully.

A BROTHER FARMER.

December 12th, 1827.

From the Newburuport Herald.

Take a fresh Musk-rat's skin, cut a strip one and a half inches wide, put it round the child's neck flesh side to the neck, an going to bed at night .- and four or five nights will effect a cure in the most obstinate case

Having heard of the same remedy for the Asthma or difficulty of breathing, and at times suffering greatly myself in that way, I was induced to try the musk rat skin in the same manner. I found it would apply that's as well to my case, as the child's on which I have tried, and know it has nearly cured the cough on applying the skin five nights shich raged to an alarming degree.

Yours respectfully, CHARLES B. PATTEN

Amesbury, Dec. 7, 1827.

To kill Ear-wigs, or other Insects, which man have accidentally crept into the ear .- Let the person under this distressing circumstance, lay his head upon a table, the side upwards that is affect. ed; at the same time let some friend, carefully drop into the ear a little sweet oil, or oil of almonds. A drop or two will be sufficient, which will instantly destroy the insect and remove the pain, however violent.

Grass Banks .- When the Belgians, who have lit tle access to turf, wish steep banks to be covered with grass, they first form them of earth, made into a sort of stiff mortar, and cut to the requisite slope, and theo cover the surface with rich soil mixed up into a plaister with water and grass seeds, which soon spring up and cover the whole with verdure.

Lord Kingston is said to have upwards of thirty thousand mulberry trees growing upon one estate in Ireland, and has already sent a quantity of raw silk into the market.

Domestic Broadcloths, for gentlemen's surtouts. are now selling in Boston for two dollars seventy=

From Loudon's Gardener's Magazine.

On the Culture of the Potato, in respect to Earliness, the Curl, the Worm, and other Circumstan-

It has been a very old custom to obtain potatoes for sets from cold situations and poor soils, it being conceived that a change from such a soil and climate would make them grow better and more luxuriant in rich soils and warm situations, like removing an animal from a cold country and short pasture to the rich pastures in the warm valleys.

I have endeavoured to trace the effects, long and well known, to their true causes, and to combine the whole in one connected system, which, if correctly attended to, will produce every variety of the potato six weeks earlier than they are at present obtained, without any additional trouble

or expense whatever.

Obtaining a crop six weeks carlier than usual is an object deserving the highest consideration; its coming into use at the season of the year when the poor man's garden affords him no new vegetables, when the stock of the old potatoes is become short and dear, and, withal, so bitter, unpalatable, and unwholesome; to have then a crep of new potatoes is a delicacy indeed, especially to the poor, depending so much for their support upon the potato; still more so to the Irish poor, to whom the potato may be said to be the staff of life.

I have planted several rows of early pink-eyes from ripe tubers, which are now coming up, almost all corled. Not a curl appears upon any of the same variety from unripe tubers, although planted within a few yards of each other. The last autumn being warm and long, enabled the worm to grow stronger and more vigorous to attack the potato, in which it made holes, and therein, perhaps, deposited its eggs, which, nourished by the heat, acquired life and strength; and, after the potato was planted and began to grow soft, it grew vigorous, and preyed upon its sap, rendering the plant weak and curled. I am inclined to think that the worm is the cause of the curl; and that, if potatos intended for sets were taken up before being ripe (before they are full grown), the worm will not have attacked them; and that, if it has, exposing the potatoes to the sun, as I have described (vol. ii. page 171.), will kill the worm before it has deposited any of its eggs. This hint I submit to your intelligent readers I must own, however, that it requires more experiments than I have yet made, to come to a final conclusion on the subject.

The worms prevailed last autumn in the potato, to that destructive degree, that they consumed much of the wheat sown upon the potato ground, before they were destroyed by the frost. In this and the adjoining counties, in almost all the ground where potatoes were grown, large patches appear naked, without a plant of wheat, although the plants now remaining are strong and healthy.

Allow me to impress on the minds of your readers the facts, that taking up the potatoes intended for seed next year before they are ripe (before they are full grown), and exposing them to the time, observing the eye cut and placing it upward, will secure, without any other trouble or expense, a crop of every variety of the potato, six weeks earlier than the same variety of the potato, Mallowed to grow ripe, will produce.

I am, Sir, &c.

A Denbighshire Gardener.

many cases be effected by a powerful stimulant, lately landed "are quite of a superior class of soand, for all practical purposes, nothing is better ciety," and many compliments on their personal than hot water, as any person may prove to himself with a withered nosegay. Camphor, however, is a still more powerful stimulant; and, by combining this substance with water by the me dium of alcohol, as much can be effected in the way of restoration to life, as is practicable in the vegetable kingdom. In the Transactions of the Prussian Gardening Society directions are given for dissolving the camphor in alcohol to saturation, by adding it till it remains solid at the bottom of the vessel. The alcohol so prepared is to be added to water in the proportion of four drops to an ounce, and the two fluids bent together, till the flocculi of camphor disappear. Plants or parts of plants are then to be immersed in this liquid, but not longer than four hours; for, if the vital principle cannot be restored in that time, they may be considered irrecoverable.

Watching the Swarming of Bees .- The hive is placed upon a weighing beam, about three feet eight inches long, with a board on the other end, on which stones of the weight of the hive are put. When the bees began to cast, (an ordinary ton swarm is between 4lh. and 5lb. weight,) and when the first pound's weight of bees have left the hive, the beam will turn back a little, the same way as a merchant's scale does on the counter: but before the scale rests, it forces out a trigger, like the pin of a mole-trap, which lets off a small iron wire to a bell in the house, that gives sufficient warning to the bee-mother to go and take care of the swarm. The above method has been practised for several years by Mr. Duncan, gardener, near Ayr .- (Glasgow Chronicle.)

SHEEP.

Numerous droves of sheep, containing (altogether) as many as five or six thousand head, been driven through this town, westwardly, this fall. The whole number sold in this State may be computed at 20,000. The prices which they have brought have been only from thirtyseven and a half to seventy-five cents, average about fifty cents a head!-though a considerable portion were much improved by the Merino cross. What would these animals have been worth, if the farmer's Bill had passed the last Congress? Not less, we would judge, than two dollars a head. Frankfort, (Ken.) Reporter.

New South Wales .- The cultivation of sugar appears to make rapid progress in this colony .-Two vessels laden with sugars of the new crop sailed for England in June last. Mr John Macarthur has been indefatigable in bringing forward improvements in agriculture, and particularly the wools of the colony. 175,000 acres of land on this side of the mountains are to be measured forthwith, and appropiated as a glebe to the Australian Church. This quantity is independent of the grant, for the like use, over the mountains. 200,000 acres also, at Van Dieman's Land, are destined to notice the advance in politeness. The Van Die- pounds] upon the whole.- London paper.

Restoring Vegetable Life .- This object may in man's Land paper states, that the female convicts appearance and accomplishments .- British Farm. Chronicle.

> Porter plaster for bruises .- This simple, singular, and safe remedy for bruises, is nothing more than a gallon of porter simmered in an earthen vessel, till, when cool, it will be of the consistence of a plaster. This preparation was spread on an old glove, and applied round the ancle of a coachman, who was thrown off his box, and miserably bruised. In three days it so effectually performed a cure, that Coachee was enabled to re-mount his box, perfectly relieved from all swclling and pain .- Eng. Receipt Book.

> Mechanical or Artificial Leeches .- This instrument has been invented by Mr. Salandier, and acts as an equivalent to leeches. Its advantages consist in extracting the precise quantity of blood that is wanted to be taken from the patient ;-in withdrawing the fiuld with every desirable despatch and gentleness ;-in not causing that repugnance, which naturally attends the application of disgusting insects or worms ;-in not causing any injury-and finally, in being practicable in every station, climate, situation, and country .-This instrument is manufactured at l'aris, by the Engineer Dumoutiez.

CHILDREN.

The following from the Middlesex Gazette, upon the management of children is correctly conceiv-

Very few boys will be insulting, or mischievous, or backward at school, who are properly managed at home. And a majority of parents, being tired of the noise, roguery and ill behaviour of their children at home, send them to school with no rules or lessons for their conduct, expecting the master in the pientitude of his wisdom and leisure to make them fine scholars, and fine gentlemen, and amiable men and women all at once, and all this is expected many times without a frown or blow, as though it were perfectly easy for a school teacher to make of forty boys at school, what a parent cannot make of two at home. "The milk of human kindness" in children is often spoiled at home, and parents wonder they do not grow right up at once, just as they ought to in every particular, under the tuition of their teach-

Remedy for Chilblains .- Soak them in warm bran and water, then rub them well with mustard seed flour; but it will be better if this is done. before they break.

MANAGEMENT OF PIGS.

The following experiment was made by a gentleman of Norfolk. Six pigs of the Norfolk breed. and of nearly equal weight, were put to keeping at the same time, and treated the same as to food and litter for about seven weeks. Three of them were left to shift for themselves as to cleanliness; sum for a month or six weeks, and, at planting become the property of the Church. An order the other three were kept as clean as possible by was made by Sir Thomas Brisbane, previous to a man employed for the purpose, with a curryhis departure, for the appropriation of 20,000 acres comb and brush. The last consumed in seven of land to the Wesleyan Missionaries, who are weeks fewer peas by five bushels, than the other employed in the conversion of the aboriginal na-three; yet they weighed more when killed by tives of this country. In mentioning the improve- two stone and four pounds [thirty-six pounds]. of these distant colonies, we should undoubtedly upon an average, or six stone twelve pounds [108]

Observations respecting t e Utility of Swallows, by the Rev. David Ure, Minister of Uphall, in Scotland.

One advantage, which this country enjoys with most others, is derived from the Swallow. These migratory birds are of an incalculable advantage to the interests of society at large, but more immediately to the husbandman. Nature has, by instinct, directed them to build their nests, and bring forth their young, at the season of the year when thuse insects, on which they live, are beginning to injure the rising crops, by depositing their eggs for the production of caterpillars. Were those myriads of insects, with which the air then swarms, allowed to fly about, without an enemy to destroy them, the caterpillars, their offspring, would, in a short time, become se numerous, that every vegetable would be totally destroyed. One of their greatest enemies is the Swallow. The most of common birds also feed their young with caterpillars-which circumstance astonishingly lessens their number. But the Swallow feeds her young with the insect or parent of these caterpillars, and is of superior advantage; for, by destroying a single fly or insect, in the beginning of from coming into existence. Thus applying a remedy to the evil in the most effectual way .--Every encouragement, therefore, should, by the lovers of Agriculture, be given to those friendly visitants. Some thoughtless people discourage them from frequenting the neighbourhood of bce hives, from a suspicion that in their flight they pick up the bees. This perhaps is no more than a suspicion: for it is probable that Swallows will not injure bees or any other insects that are armed with stings. But although a few bees should be destroyed by them, their loss is of very little consequence, compared with the advantages arising from the destruction of the caterpillars and other devouring vermin. It is believed, by accu- a million and a half of sheep, and 25,000 hogs. rate observers that one nest of Swallows will devour in a season, about 100,000 insects, which, with their caterpillars, would destroy an immense quantity of growing vegetables. Another advantage arising from the Swallow is, that it never lives on grain, which is not the case with most other hirds.

Patent Water-wheel .- The Dever (New Hampshire) Republican, states, that "Mr. Elijah Skinthe open single screw or spiral water-wheel, called the 'open screw water-wheel,' which promises to be of great utility. This wheel is used by placing it herizontally in a river parallel with the current; and, where the depth of water will admit, wholly immersed, giving the water free passage into the screw or float boards. In small streams, where there is but little head and fall of water, this wheel may be used in a similar manner to the good." tub wheel, by means of the water passing through a long hollow cylinder in a perpendicular or oblique direction. The advantages claimed for this improvement are, that these wheels may be used to advantage in slow and deep currents where dams cannot be conveniently built, without obstructing navigation, and may also be used in tide waters with the ebb and flow of the tides, or in floating mills, or at the bow or stern of vessels for working the pumps, &c.; and lastly, its cheapness of construction."

Cultivation of silk .- Considerable attention is now paid to the cultivation of this article. A number, within our knowledge, have engaged successfully in the business. Their success will be productive of much benefit. It will excite the attention of others to this employment. The following facts are worthy of attention. Four acres of land planted with the mulberry, near Boston, have supplied food for as many worms as made 420 pounds of ailk-worth \$3,30 per pound, or \$1,470; all of which were attended to by four girls, and only for a short period in the year .-This employment is well calculated for those, who are advanced, and also for those families in which there are many young children, neither of which it was here. would be very profitable in any other way. It is said, that the best method of cultivating the mulberry is to sow it broad cast, then the leaves may be mowed off and raked together for use, without much trouble. The leaves are also more tender than those, which grow on trees, a sufficient number of these however, must be reared to furnish annual supplies of seed .- Dunstable, (N. H.) Gaz.

To preserve seeds in a state fit for vegetation.— Fill an old cask about half full of moist earth; summer, many thousands of vermin are prevented then put the seeds, these especially which are not of an eily nature, and consequently liable to spail soonest, as near the centre of the cask as possible; then fill up the remaining portion of the cask with moist earth, ramming it tight, and heading the cask so as to make it completely air and water tight as possible, and stow it away in a place to which no salt water is likely to reach. In this way, seeds may be brought, with perfect safety, from the East Indies or New Holland.

> Ment .- The consumption of Meat in London may be nearly ascertained by the annual sales of cattle at Smithfield market, which amount to about 150,000 hend of large cattle, 30,000 calves,

Bread Stuffs .- The annual consumption of corn in Lendon is about eight millions of bushels; four fifths of which are made into bread, and amount to 64 millions of gr. loaves. The Butter consumed is 11,000 tons. Cheese 13,000. Milk valued pulled, and sold, to raise 50 cents to buy rum. at nearly five millions of dollars ;- Poultry, from 3 to 400,000 dollars. Game of various quantities.

Agriculture in Russia .- An economical Society and a school for the education of future agricultuner, of Sandwich, has patented an improvement in rists, have recently been established at Moscow, through the exertions of Prince Galitzin. "The branches of instruction are the following: the Russian language, book-keeping, agricultural chemistry, botany, the physiology of plants, the management of woods and forests, technology, farming, and the veterinary art. The course lasts 5 years. The Society publishes a journal in the Russian language, which has already accomplished much

> It is proposed to light the city of Fittsburg with Seneca Oil. It is found in abundance floating on the surface of some of the creeks, and it is said that it might be furnished for twenty-five cents per gallon, if a market was opened for its use.

Fruit and Vegetables .- The neighborhood of left to right. London furnishes it with fruit and vegetables, and occupy about 6000 acres, which are laid out in the body, is a better way of emptying the stomach. gardens, and give employment to 30,000 persons than the new invented pump. [This is easier said in winter, and nearly 100,000 in summer.

SILK MANUFACTURE.

About six weeks since, Mr Douglas, a Scotchman, came to Windham, Conn. for the purpose of establishing himself in the weaving of silk ribbands .-To this he was led from the low rate of board, and the great facility of obtaining good and cheap silk. He has wrought so long in his native country, and latterly at New York, that his opinion ought, perbaps, to be entitled to some weight .-He atated to mo, that it was his sincere conviction that he had never worked, or seen, from Italy or France, superior ailk to that manufactured in Wiedham county, and those immediately adjoining; nor did he expect to see it better dyed than

It has been estimated. I believe, that silk to the amount of thirty or forty thousand dollars, is annually produced in this county; but this is probably much under the present proceeds. In Tolland, also, and some of the adjacent counties, it is largely cultivated. The quantity produced by single families, varies from 10 to 150 lbs. weight .-It is presumed that Capt. Storris, of Mansfield, has raised the present year upwards of 100 lbs. of silk. Here, then, is \$1000 gained without interfering in the least with the other products of his farm, besides affording an abundant supply of luxurious feed for his pigs and poultry !- Mass. Journal.

To preserve flowers .- Gather them in various stages, from the young bud to the full-bloom blossom, and press them carefully between several folds of blotting paper, changing them into dry parts of the paper, every second or third day, untill all their moisture is absorbed, then press them between the leaves of some book. The same cautions apply to leaves, which should always be th€ most perfect.

Russian Tallow .- The amount of Tallow in the market of St. Petersburg, the last season, was 160,000 casks; of which 135,000 were seld at c reduced price from the previous years' sales; & ceurse 25,000 casks remained on hand, to be disposed of at a still lower price.

It would seem from an article in the Portsmout. Times, that some person lately had a sound tooth

A Profitable Farm .- Mr Comfort Elliot, of Cregden, N. H. has a farm of 80 acres, on which he has this year raised 175 bushels of grain and 1930 bushels of potatoes. He has this fall turned of, in stock, grain, butter, shoats, &c. enough to amount to over 500 dollars, and has a bandsome stock left. He has hired but three months' labor during the season .- Concord Gazette.

A Kentucky paper says 20,000 sheep have been recently sold in that state, at prices averaging about 50 cents a head.

The Egyptians instructed the Greeks: the Greeks performed the same office to the Romans, and the latter have transmitted much of that knowledge to the world, of which we are in possession at this day.

Cadmus, in 1519, B. C. introduced alphabetical writing into Greece, from Phænicia. The alphabet then had only sixteen letters; and the mode of writing was alternately from right to left and

Dr. Arnot says lying with the head lower than than done.]

From the National Intelligencer.

INTRODUCTION OF FOREIGN PLANTS AND SEEDS.

The following circular, addressed by the Secretary of the Treasury to a portion of the American consuls abroad; in relation to the introduction of valuable foreign plants into the United States, is made public, in the hope that the object which it has in view may be the better promoted, by causing it to be more generally known.

Copies of the circular have been placed in the hands of the principal collectors, of whom they may be had by such masters of vessels, or others going abroad, as may be willing to aid in carrying into effect a design believed to give promise of public utility.

CIRCULAR.

Treasury Department, September 6, 1827.

Six-The President is desirous of causing to be introduced into the United States all such trees and plants from other countries, not heretofore known in the United States, as may give promise. under proper cultivation, of flourishing and becoming useful, as well as superior varieties of such as are already cultivated here. To this end I have his directions to address myself to you, invoking your aid to give effect to the plan that he has in view. Forest trees useful for timber; grain of any description; froit trees; vegetables for the table; esculent roots; and, in short, plants of whatever nature, whether useful as food for man or the domestic animals, or for purposes connected with manufactures or any of the useful arts, fall within the scope of the plan proposed. A specification of some of them, to be had in the country where you reside, and believed to fall under one or other of the above heads, is given at the foot of this letter, as samples merely, it not being intended to exclude others, of which you may yourself have knowledge, or be able on inquiry to obtain knowledge. With any that you may have it in your power to send, it will be desirable to history as may be attainable in the country to wasted on objects utterly useless. which they are indigenous; and the following particulars concerning which information may be the shade, sought:

They should be put in a box with sandy be put into a box, and each plant secured by laths earth in the following manner: first, about two fastened crosswise above the roots, and the inter-In removing seeds or plants from remote places inches of earth at the bottom; into this the seeds stices between the roots filled with wet mossgrafted or budded fruit trees.

Where the time will permit it is desirable that the roots of the plants be well established in the boxes in which they are transplanted. Herbaceous plants require only a short time for this; but, for plants of a woody texture, two or three months is sometimes necessary.

that are sown, may be made about two feet bread, two feet deep, four feet long, with small holes in the bottom, covered with a shell, or piece of tile, superfluous water. There should be a layer of wet moss of two or three inches deep at the bottom, or, if that cannot be had, some very rotten wood or decayed leaves, and upon that about twelve inches depth of fresh loam earth, into which the plunts that are to be transplanted should be set. The surface of the earth should be covered with a thin layer of moss, cut small, which should be occasionally washed in Iresh water during the voyage, both to keep the surface moist, and to wash off mouldiness, or any saline particles that may be on it.

When the boxes are about to be put on board ably confer a lasting benefit to the country. the ship, hoops of wood should be fastened to the sides in such a manner that arching over the hox. they may cover the highest of the plants; and over these should be stretched a net work of pitched cord, so as to protect the plants from external injury, and prevent the earth from being disturbed by mice or other vermin.

To each box should be fastened a canvass covor, made to go entirely over it, but so constructed as to be easily put on or off, as may be necessary to protect the plants from the salt water or winds, and sometimes from the sunshine. Strong handles should be fixed to the boxes that they may be conveniently moved.

During the voyage, the plants should be kept in a light airy situation; without which they will perish. They should not be exposed to severe winds, nor to cold, nor for a long time to too hot a sunshine, nor to the spray of the salt water .-To prevent injury from the saline particles with which the air is sometimes charged at sea, (especially when the waves have white frothy curls upon them) and which, on evaporation, close up the porce of the plants, and destroy them, it will be proper, when they have been exposed to them, to wash off the salt particles, by sprinkling the leaves with fresh water. The plants and seeds that are sown, will occasionally require watering on the voyage; for which purpose rain water is best. If, in any special case, instructions upon this point, or upon any other connected with the management of the plants during the voyage, be necessary, they should be made known to those having charge of the plants. But after all, much will depend upon the judicious care of those to whom the plants may be confided during the voyage.

Plants of the succulent kind, and particularly of the bulbous family, should not be planted in earth, but in a mixture of dry sand, old lime, rubbish and vegetable mould, in about equal parts, and should not be watered.

It may not be necessary, in every case, to observe all the precautions here recommended in regard to the putting up and transmission of seeds; but it is believed that there will be the risk in departing from them, in proportion to the distance

structions, to exclude the adoption of any other conviction that the matter imperatively demandmodes of putting up and transmitting seeds and our most careful researches, and the sincere co plants, which are in use in any particular place, operation of "every practical farmer, and every and which have been found successful, especially man who has the interest of the country at heart. tached from the vessel which you now command.

I am, respectfully, &c. SAM. L. SOUTHARD.

From St. John-(N. B.) Gazette. SEED WHEAT.

In the Gazette of the 12th ult, we laid before our readers, such information as we had previously obtained, concerning a species of wheat, new in this country; and in consequence of the manner in which it was introduced, called "Tea Wheat;"* and on the 26th, we took notice of a communication in the Fredericton Royal Gazette, of the 18th, on the same subject, and extended our remarks. The very great importance of the subject, and its intimate connection with one branch of our agricultural interests, will, (we trust) be a sufficient apology for bringing it again, and thus early, under consideration. Our friend, (the editor of the Royal Gazette) who has taken a lively interest in this matter, on the 2d instant, states, that "be had received such additional information on the subject, as to produce in him a firm conviction, that the matter imperatively demands the most careful research," &c. The same Gazette contains a communication, relating to some wheat lately imported from Malaga, which also has the quality of resisting the effect of rust, &c. &c. We do a liv and heartily concur with the editor of the Read Scretto and aish to give all possible publication that in the facts .-The new crops not to r ? sent season of via a verse received this purpose and Portant in a proprovident farmers to take a disposal convex change of wheat or by purchase, as effectually to secure themselves as much as they may think proper, to the use of the new seed; and we think it will be a gross and palpable neglect, in such persons, as emit to avail themselves without loss of

The same methods may be observed with young of the country from which the seeds are to be time, of the valuable information thus circulated brought, and to the difference of its latitude, or of The Royal Gazette, of the 2d inst. says as follows the latitudes through which they will pass on the "We have already received such additional inforvoyage. It is not intended, however, by these in- mation upon the subject, as to produce in us a firm We have conversed with a gentleman who has fact-and the same individual has already bought up seven bushels of the tea wheat, every grain of which he will carefully preserve for seed, (giving Sir-I have to call your attention to the enclos- other wheat in exchange) and we earnestly trust ed copy of a communication from the Treasury the example will be generally followed, and that Department to the consuls of the United States at those farmers who may not be disposed to part various ports; and to desire that the objects of with it, will at least carefully preserve as mech

> Malaga Wheat .- We have this moment receiv ed the following communication:-

Sir,-Having seen in your paper some notices respecting what is termed "Tea Wheat," and beso full and satisfactory, that no further explana- ing acquainted with similar qualities in another parcel, casually brought into this Province, I beg You will be pleased to report to the Department to follow A. B's, example, in calling the attention what you do in execution of this object, and return of the public to it through the medium of you the papers to the Department when you are de-columns. The original sample was brought from Malaga, in the Mediterranean, and first sown in the upper districts on this river-how long ago I cannot say, but it may now be procured in considerable quantities. Mr. Thomas Pickard sowed an extensive tract of land with it, and had it quite free of rust. Mr. William Wilmot sowed half a bushel of it last year, and although every other part of his wheat grounds were affected by rust. not the least symptom of it appeared among the "Malaga Wheat." Mr. Benj. Sloot, sowed a peck of it in the midst of a field of the usual wheat of the county, and not a single stalk of it bore a rusted head, while all around the common wheat was much affected. There must be many other instances no doubt, if the facts were known, but these are surely sufficient; and the sources of information being at our doors, the matter should certainly be investigated.

I am sir, yours, &c.

"In addition to C. D's, favor, we understand Maj. Harding, of Maugerville, planted this year one bushel of the Malaga Wheat, which he expects will yield him at least fifteen bushels ;-the grain of which is unusually large and full. Major-Harding has also a large quantity of Tea Wheat in equally fine order."

A new variety of Oats -Our agricultural friends will be gratified a descring that a new species of oats, possessing rue and estimable qualities, has been introduced taison into the Province 4 few bashels of there an lerstand, were . up ited by kis Exceller y. ' a lieutenant governor sown, during the last energy in a field enon the Pecinsula -and have then found to matere and ripen nearly a month and the than have a varia has yet been naturalized in conclusion A2. are productive, rise with a street, . . . and are large and plump in the garage duce of the field, to which we have all a se will be preserved as seed for the ensuing of a n;

^{*} See N. E. Farmer, Vol. VI. page 82.

it will be sown during the next in the different convert any substance into manure, which is good quarters of the Province; and should it preserve and wholesome food for man or beast. its present qualities, and continue to ripen as early in future years as in this, it must be regarded as a benefiction of the most important character. Such an oat, in fact, has long been a desideratum in our agriculture. The species, which is now common in the country, lingers so long before it reaches muturity, that it delays the harvest beyond the most convenient periods, and crowds the farmer's labor upon his hands. An oat which will ripen, as this does, before, or along with the early-sown wheat, will cause a more regular distribution of the toils of the harvest, bring the sheaf to the stack or barn in finer condition, and multiply at once the amount of food both for the family and for the stock. Notwishstanding Dr. Johnson's cynical definition of the oat-we are satisfied that the emancipation of Nova Scotia depends upon it-and that the universal introduction of a finer variety of that grain would tend to hasten the happy and prosperous event .- Helifax Novascotian.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 21, 1827.

To Correspondents.—An article from Plymouth, on BEES, and another on FISH PONDS, ARIMAL MANUEES, &c. will appear next week.

INTRODUCTION OF FOREIGN PLANTS AND SEEDS.

The article on this subject, which we have given in this day's paper as emanating from a high official source, must be very gratifying to all who have the agricultural interests of the country at heart. The "directions for putting up and transmitting seeds," &c. appear to as to be (in general) tion, copied from these "directions," is contrary by Dr. Deane, in his N. E. Farmer, says, "many years, and retain their vegetative faculty; whereto the nature of the oil," &c. "Seeds of cucumbers, melons, and gourds, which have thick horny coverings, and the oil of the seed of a cold nature, will continue good for ten, fifteen, or twenty years," &c .- (Gleanings in Husbandry.)

is turned to this substance, which in former times was little to be expected. Their male stock was was considered rather as a nuisance than as an let out every year to breeders, from all parts of article of any value on a farm. A writer for the England; and thus, by judiciously crossing the N. E. Farmer, (see Vol. II. page 51) states, in substance, that he had used poinace for manure, ley variety descended, after three or four genewith good effect, after having mixed it with "a rations to their posterity. By no other means, quantity of leached ashes, in the amount of one could this new breed have spread so rapidly, nor quarter of the bulk; this was heaped up and lay have been made to accommodate itself so easily all summer to give the alkalı a chance to work on the acid." The pomace, thu prepared, made an commendation of this plan was, that the ram-hirer excellent manure for grass land. If it were mix- had a choice among the number of males, of some ed with unicached ashes, or a small quantity of what different properties, and in a more or less quick lime, just sufficient to neutralize the acid advanced stage of improvement; from which it it would, no doubt, be found valuable as manure. was his business to select such as suited his par-But we think its best application is that pointed ticular object. These were reared by experiencout by "A Brother Farmer," in this day's paper .- ed men, who gave their principal attention to this

WOOD PECKERS USEFUL.

A senseless warfare is often waged by boys, and "children of a larger growth," against the wood pecker, a bird which is not only harmless, but useful. Some have supposed that these birds injure apple-trees, and other trees, the bark of which they perforate: but this is not the fact. They are in pursuit of the borer, and other insects injurious to the trees. Mr Cornelius Cowing, of Roxbury, informs us that he lately found in the stomach of one of these birds, no less than 23 borers, which had been recently extracted, probably from orchards in the vicinity. The tongue of this bird is said to be sharp pointed, and bearded .--Having made a hole with his bill into the habitation of the insect, he impales it on the point of his tongue, and is thus able to extract and convert it

BREMEN GEESE.

flourished a fork over.

BREEDS OF DOMESTIC ANIMALS.

The choice of the best breed of horses, cattle, and hogs, which is too little regarded, is of the greatest importance to a farmer, and deserves his correct and judicious. But the following asser. nicest attention. The expense is as great-nay, many times greater, in keeping a creature of bad to generally received opinions. They state, that, breed, as of a good, and the value is very differ-"the oily seeds soonest lose their germinating ent. Mr. Bakewell, (of the Dishley farm, in Engfaculty." The Dictionary of Arts, a work quoted land) rendered himself famous by his breed of cattle. His principal aim was to gain the best, whesorts of seeds will continue good for several ther sheep or cow, which will weigh the most in the most valuable joints; and at the same time as others will not grow after they are one year that he gains the shape which is of the greatest old. This difference is in a great measure owing value in the smallest compass, he finds by experto their abounding more or less with oil; as also lence that he gains a breed much hardier and easier fed than others. In his breed of cattle, his maxim is, the smaller the bones the truer will be the make of the beast; the quicker it will fatten, and the weight will have a larger proportion of valuable meat.

The practice of Bakewell and his followers, furnishes an instance of the benefits of a division We are glad that the attention of agriculturists of labor, in a department of business, where it old races, all the valuable properties of the Dishto a change of climate and pasture. Another re-It is not good economy, (generally speaking,) to branch alone; and having the best females as

well as males, they were able to furnish the necessary supplies of young males to farmers whose time was occupied in other pursuits. The prices at which Bakewell's rams were hired, appear enormous. In 1789, he received twelve hundred guineas for the hire of three brought at one birth; two thousand for seven; and for his whole letting at least three thousand guineas .- (Encyc. Brit.

By proper management, Mr. Bakewell caused his cattle to be very gentle. His bulls would stand still in the field to be handled; and were driven from field to field with a small switch .--His cattle were always fat, which he said was owing to the breed.

"Cross breeding, under judicious management, might probably be often employed to correct the faults of particular breeds, or to impart to them new qualities."-"Were I," says Sir J. S. Sebright, "to define what is called the art of breeding, I should say it consisted in the selection of males and females, intended to breed together;-We have just seen some young goese of this in reference to each other's merits and defects. breed, raised by Colonel JAQUES of Charlestown, It is not always by putting the best male to the Mass. much surpassing any of their species,- best female, that the best produce will be obtainwhich have ever before met our view. There ed; for should they both have a tendency to the were eight of them, hatched in the fore part of same defect, although in ever so slight a degree, May, and fed on grass only, till ten days ocfore it will in general proponderate so much in the they were killed; heing then about seven months produce, as to render it of little value. A breed old. They weighed, after being dressed, on an of animals may be said to be improved when any average, sixteen pounds each! and were as fat, desired quality has been increased by art, beyond fair, and fine as any thing that un epicure ever what that quality was in the same breed in a state of nature; the swiftness of the race-horse, the propensity to fatten in cattle, and the fine wool in sheep, are improvements which have been made in particular varieties of the species to which those animals belong. What has been produced by art must be continued by the same means, for the most improved breeds will soon return to a state of nature, or perhaps defects will arise which did not exist when the breed was in its natural state, unless the greatest attention is paid to the selection of the individuals which are to breed together.

"We must observe the smallest tendency to imperfection in our stock the moment it appears, so as to be able to counteract it, before it becomes a defect; as a rope dancer, to preserve his equilibrium, must correct the balance before it is gone too far, and then not by such a motion as will incline it too much to the opposite side. The breeder's success will depend entirely upon the degree in which he may happen to possess this particular talent.

"Regard should not only be paid to the qualities apparent in animals selected for breeding, but to those which have prevailed in the race from which they are descended, as they will always show themselves sooner or later, in the progeny : it is for this reason that we should not breed from an unimal, however excellent, unless we can ascertain it to be what is called well bred; that is, descended from a race of ancestors, who have through several generations, possessed in a high degree the properties which it is our object to obtain. The offspring of some animals is very unlike themselves; it is, therefore, a good precaution, to try the young males with a few females. the quality of whose produce has been ascertained; by this means we shall know what sort of stock they beget, and the description of females to which they are the best adapted. If a breed cannot be improved, or even continued in the degree of perfection at which it has already arrived, but by breeding from individuals so selected as to cerrect each other's defects, and by a judicious combination of their different properties (a position that will not be denied), it follows that animals must degenerate by being long bred from the same family, without the intermixture of any other blood, or from being what is technically called bred in and in.

Bakewell and Culley say "like begets like," therefore breed from the best. Of this says Sir J. S. Sebright, there can be no doubt, "but it is to be proved bow long the same family, bred in and in will continue to be the best." Cross breeding appears no doubt more consonant to what takes place in nature than breeding from very near relationship; and arguing from analogy, the result of certain experiments made by T. A. Knight, on the vegetable kingdom, seems to justi-

same rule holds good regarding the human species. By a train of unfortunate circumstances, a brother and sister, German, ignerant of their close connexion tegether, were married. They had ten children, all of whom died before their parents."

POUNDED OYSTER SHELLS MAKE GOOD MANURE.

At Holkham, in England, oyster shells are broken to pieces, either by passing them through oil-cake crushers, or repeatedly drawing a heavy iron roller over them when spread upon a stone, or hard burned brick-on-edge floor. A mill for crushing bark would answer the same purpose.

Forty bushels of this manure were drilled in the usual way, upon 27 inch ridges, slightly covered with earth and the turnin seed communication. The control of the coverage of t with earth, and the turnip seed sown upon it.—

The growing and manufacturing of silk is hecoming more strength and manufacturing of silk is hecoming more extensive in this country, and the attention of many public spirited individuals has recently been turned to it. That it the same size, manured with farm yard dung, at the rate of 8 tons per acre. The turnips were a good erop on both pieces, no difference perceptigood crop on both pieces, no difference percepti- and comprises an area of only about forty-six square miles—it ble; the succeeding crop of barley, and the crop soil is less productive than that of many other towns, yet the of clover afterwards, to all appearance, were equally good on both.

IMPORTANT NEWS.

On the 20th of October, a battle was fought between the allied fleets, and the Turko-Egyptian fleet, in the Morea, which terminated in the entire destruction of the latter. The Turkish fleet was attacked in the Bay of Navarin, at two o'clock. At 5 o'clock the first line of the Turks was destroyed, and their ships of the line and razee frigates were sunk or burnt; and the remainder went on shore, and were burnt by their crews. Of this formidable armament, there remain only about twenty corvettes and brigs, and

The report on the Lead Mines, gives a very satisfactory view of the impertance of this property to the United States-the expected annual supply is equal to 10,000,000 pounds. A tythe of which, as rent received by the Government, will be more than sufficient for the purposes of the English White Mustard seed, by the pound or bushel. Army and Navy.

A norsery garden has been established in the city of Caraceas by Dr. Fanning, (an American) for the purpose of collecting the most useful and ornamental plants of Colombia. He is also forming a botanic garden in the vicinity, under the patronage of Belivar.

It has been calculated that the manufacture of wool, (including the various mechanics and laborers employed,) in the New England states, subsists about 20,000 families, or 120,000 persons, and that these will consume the surplus products of 40,000 families of agriculturists; together, about 369,000 individuals.

Sea Coal .- The annual consumption of Sea Coal, in Loodon, is about one million and a half chaldrens.

Rare Production.—In the market yesterday, at Knight, on the vegetable kingdom, seems to Just!

If ns in concluding that occasional crossing may be some not en'y advantageous, but even necessary for the purpose of correcting defects. Nevertheless, as the last mentioned writer and Cline observe, it can only be safely resorted to by skilland experienced breeders."

Sir John Sinclair says that cattle will deteriorate by breeding from near relations; and "the came rule holds good regarding the human special content of the same regarding the bunnan special content of the same resource in the same rule holds good regarding the human special content of the same rule holds good regarding the bunnan special content of the same rule holds good regarding the bunnan special content of the same rule holds good regarding the bunnan special content of the same rule will be safely a same rule and the same rule holds good regarding the bunnan special content of the same rule will be safely a same rule and the same rule same ing from being the production of our northern clinites, olicitate at this inclement season. The fruit, we understand, was gathered for the purpose of relieving the tree which bore it, of a part of its redundant stock, and to aid the growth of another vigorous crop. It is refreshing to turn from the coise and distractions of those party times, to witness the silent course of nature, pursaing her operations in unfailing regularity, offering lessons of order for human imitation, and teaching that as a good tree is hown and prized by its fruits, so every public servant whose political worth stands approved, should be duly estimated by the community whose interests he promotes, and be rewarded with those tokens of continued confidence and favor which may incite him to bring forth more abundantly his fruit unto perfection.—Centinel.

> Silk .- In Norton's & Russell's State Register it is stated, that " in the town of Mausfield, in Tolland county is annually raised upwards of 3000 pounds of silk, which, (in it

> may he made profitable, and a source of great income, cannot be doubted when we look at the single instance of the town of Mansfield. That town has less than three thousand inhabitants in a yearly revenue of about 29,000 dollars. What an induce ment is bere held up to the industrious and enterprizing, and if initiated, how long should we be dependent on the old world for silk?

> Literary Generosity .- The Providence Ameri can relates an account of a gentleman, known only by the designation of A. B. who had volunteered and actually rendered his services, in three different towns in Rhode Island, as a teacher of a school for several months in each, free of any expense; and when his board was offered to be paid, he declined the offer. After finishing his services in one town he left 16. pease; and when his board was offered to be paid, he declined the offer. After finishing his services in one town, he left 46 dollars with a qualified female who had attended his school, that he might continue the school in the summer months. He still remains "the unknown Teacher." Under date of Oct. 13, in the Newport Mercury, he again offers to teach a school in Coverty, R. I. and has probably commenced.

At Taunton, Mass. 1,200 tons of nails are made they were abandoned. A spectator of the combat calculated that there were 150 vessels of all classes engaged in the fight.

and they abandoned. A spectator of the combat animally, and three hundred tous of plates, hoops and machine ty. Ai Pittsburg, there are seven rolling and slitting mills, eight air founderies, six steam engine factories, one wire factory, &c. Some of these are very large establishments—one of them has two engines of 100 and 120 horse power.

MISCELLANIES.

[From the Bijou, for 1828.]

ON A LITTLE GIRL. BY WM. FRASER.

That beautiful and starry brow. With youth and joy all splendent now-Can it be marred by years? That passionless and stainless breast. Where iunocence bath raised her nest-Must it be racked by fears? That glowing cheek and sun bright eye Whence laughter wings its archery-Will it be stained with tears ? Such is, alas! the bitter doom

That waits each tenant to the tomb :-And how canst thou, young bud of beauty, be Excluded from the pale of destiny!

But years will pass nor leave behind One stain upon thy scraph mind-Then, come, thou fearful age! And fears that rack thy breast may prove The token sure of passionate love-Such is love's hermitage! And tears from pity's fount will flow, And on the cheek full sunny glow. Of joy the fond presage !

Thy days shall onward wing their way, Like the month of fragrance-breathing May; Or should Grief come thy beanties to enshroud. It shall pass o'er thre lile an April cloud.

CHLIST MAS.

Right well our Christian Sires of old, Lov'd, when the year its course had roll'd, And brought blithe Christmas back again With all its hospitable train. On Christmas eve, the bolls were rung-On Christmas eve, were authoms sung; and Christmas blessings oft would cher; The poor man's heart, thro' half the year. All hailed with uncontrol d delight, And general voice, the happy night, That to the cottage, as the crown, Brought tidings of salvation down.

CHURCH GOERS.

"Two levely ladies dwelt at -And each a churching goes; Lamma goes there to close her ever, And Jane-to eye her clothes.

Some of Billy Black's Conundrams .- Why is a short negro like a white man? Because he is drug; but still the pedlar was a favorite visitant, not a full black.

Why is a man about to take a glass of-brandy, like a man going to beat his wife? Because he days, however, could not always last. Our politi is going to li #-her.

chouse which Jews resert to? Because He brews were compelled to be ake themselves to other drink in it.

Why is the month of a hard drinker like an India rubber over-shoe? Because it never lets in bonds-but in process of time, finding the statute

new novel of "The Baccamers? Because they their depredations have been bold and frequent. are hardly worth reading.

A shormaker for the purpose of eclipsing an opponent who lived opposite to him, put over his door the well known motto of . Mens conscia recti ' His adversary, to offer a more general bait to the twenty-fifth year, before they subject themselves public, placed a bill in his windows, with these to the cares and fatigues of a married life; as the words, " Mens and Womens conscia recti." This constitution of but few women can be regarded as anecdote brings to our recollection a joke which firmly established until after their twentieth year.

the witty Joseph Miller has recorded it in his laugh- taste previous to that age, will applaud his advice, ter stirring volume. A painter was desired to make but such as may meet with husbands to their mind. a hatchment, on which was the motto " Sic transit will judge of their own fitness, and laugh at the gloria mundi." It so happened that he was desired Doctor. to deliver in his performance on a Monday; it was not however, finished before the succeeding day, and as a proof of his attention and accuracy, he altered the motto, and delivered the melancholy emblem of death to his customer, with the following alteration, " Sic transit gloria Tuesday".

The day of small things .- A dealer in cat and dog meat, in London, has lately placed over his door, in golden capitals, the following words,-"cat and dog meat bazaar."

Pedlars .- About the year 1821, the good State of Massachusetts swarmed with a race of longsided, cunning, guessing, question-asking, hypocritical, bargain-making rogues, who prosecuted their trade with indefatigable diligence.

The pedlar, taking his cargo of tin trumpets, or adulterated essences on board a vehicle, rooking more like a ministere of Noah's ark when it rested on the mountains of Millbury, than any christian conveyance-or packing his needles and thread, his combs and calicoes, in a huge box strapped over his shoulders, roaming to and fro on the earth, seeking whem to cheat. His home was every where, and his dwelling-place in all habitations of man or beast. You might find him in the public room of the tavern, round the fire-sine of the farmer, or snugly rested in a corner of the barn. The rising sun shone upon his path among the hills of the north, and his declining heams li hted the eternal pedlar on his way to the sea shore. He intruded himself on the domestic privacy of every home, and his inexhaustible eloqueoce yielded him many a penny of profit on his miserable wares. Sometimes with the hardy en terprize of New England character he crossed the mountains, and rended his wooden nutmers and pumpkin seeds among the astonished natives of the west, whose exhausted purses and length. ened faces bore testimony to the superiority of Yankee skill in cheatage over their own incentiity. True it was, the farmers' children had their teeth set on edge by eating sand instead of sugar. and our village belle often mourned over the transitory splendar of her go-to-meeting gownand the sick man died after taking the poisonous and his gains grew great when resting on such a prolific source as public credulity. These golden cal fathers issued an edict to prohibit the trade of Why is Mr. Filller's browery like a public, the itinerant merchant, and wandering vagrants States. The terror of the law, for a space, freed the good people from the visitations of these vagashowed its teeth without biting they began to re-Finally-Why are these communicums like the turn and infest our borders. Within a few years, Worcester . Eais.

Early Marriages .- A medical correspondent of the Portland Patriot thinks it would be advanta geous for females to pass their tweety-fourth or may have escaped some of our readers, although Every female who does not have an offer to her are entitled to a sixth volume gratis.

A fine woman ought to add annually to her accomplishments, as much as her beauty loses in the time.

Winter Evenings .- The intelligence and often the success of farmers, depend on the manner their Winter evenings are spent. The privilege of devoting them to the acquisition of useful information, is not enjoyed so uninterruptedly by any class .- The farmer's pursuits of the day invite him to draw near the fire; and if he has a taste for useful reading, particularly for that connected with rural pursuits, we scarcely can imagine one to spend his time more rationally and happily .--Knowing that all his live stock are well fed and taken care of, and harassed with none of the anxietics of those whose business is connected with thousands, and liable to ten thousand reverses, he can give his mind wholly to the sentiments and reasonings of his author.

But many who cannot command more than one, two, or three hours at a time, excuse themselves from reading altogether. The father acts on this principle, and the sons follow his example; and thus it is that there are not more extensively read and enterprising farmers. Let us now make some calculation of the time that could be employed in the acquisition of useful information, from the age of fourteen to fifty .- Suppose that three hours of the twenty-four, for four days of each week during the six Winter months, were spent in useful reading. This would amount, when he would arrive at 50 years of age, to 11.232 hours. If he read 20 pages per hour, it would be 224,640 pages. Allowing each volume to contain 224 pages. it would amount to one thousand volumes. Now. what would be the result of thus devoting this small portion of his time? It would give a right bent to his mind-tend to prevent him from spending his time and money at improper places-he would become acquainted with the state of agriculture in his own country, and in others-hecome more enterprising, and be enabled to use to better advantage the means within his reach, and thus become a more successful cultivator of the soil. In fine his taste for knowledge would increase; he would become a more valuable citizen. a blessing to his friends and neighbours, and more likely to descend with grey hairs in repose to his grave. FOR THE SEW ENGLAND FARMER.

BEES.

MR FESSENDEN-I offer no apology for recurring again to the subject of the honey bee since you have encouraged me to that effect in the New England Farmer, 7th December. I have, however, no pretension to experimental or practical skill in their management, and possess but a small share of information derived from books, (having always been an advocate for book knowledge) and from verbal communication.

The fact stated in your last paper of a snail entrapped in a hive,* brings to my recollection a few circumstances equally calculated to excite the admiration of your readers.

On taking up a hive in autumn a few years since, the body of a mouse was found entirely encased in the substance of the comb, and so effectnally embalmed by their own materials as to exclude the access of atmospherical air, and to obviate the possibility of annoyance from the process of putrefaction.

During a warm day the last summer, I witnessed the surprising alacrity with which bees can repel the attacks of an eremy. A large humble bee, and a very large ox fly, after being deprived of one wing, were thrown on the projecting board of my bee hive; they were instantly attacked by as many bees as could have access, piercing their bodies with their stings till they expired and then forcing them from the hive to the grounds From this it may be supposed that were the beemoth to make its pillaging visit at mid-day instead of skulking in the dark, it would be entirely foiled in its base attempt.

In Rees' Cyclopedia or the Edinburgh Encyclo pedia, I have read the following curious statement. In autumn 1804 the copious collections of honey which had been made during summer had entirely disappeared, and the moths were nncommonly abundant. The owners of a number of hives resolving to protect them from further pillage, closed their entrances with tin gratings, where the apertures were proportioned to the size of the bees on the 17th September: hut not having enough for the whole, two were left unsecured. It was seen next morning on examination that during the night the bees had themselves taken the necessary precautions by contracting the entrances of their hives so as to make them quite safe against invasion. Each was completely blockaded by a wall composed of old wax and fa-

spertures corresponding to their own size: two that would prevent above two bees passing at a time were fashioned like inverted arches; a third was broad enough in front to admit of the passage of several bees at once, but so low that they were abliged to lean over on one side to get through. All the other hives proved on inspection to be constructed in the same way, even where provided with the tip gratings. In other instances the bees had constructed a double wall at the entrance of the hive, with covered galleries so narrow that no more than a single bee could pass; fifty-three swarms began these operations in the course of the same night. In countries where their great enemy the sphinx atropos abounds, the apertures when the chief collection of honey takes place. must be made very low that this insect may be excluded.

The following instance might, in the view of some, justify an impeachment of the integrity of the instinctive faculties of these insects. It was copied from the New York Medical Repository a few years ago, into the American New Dispensatory, by the present writer, as tonding to prove apartment for their permanent residence, as iz. the virulent nature of the Rhus Virnix, or swamp sumach. A swarm of bees attached themselves to a branch of the Rhus Virnix, after which the branch was cut partly through, and for some reason the beca were suffered to remain: the next morning the whole swarm were found dead and this communication will be in a measure uttained. their bodies turned black and swelled to nearly twice their natural size. Now it is well known that instinct in animals enables them to distinguish and to avoid those poisons which prove destructive to their own nature; by what means therefore, was their instinct confounded in this instance? Not perhaps from any error in the choice made by the bees; had the tree remained in its natural state, they might probably have continued to adhere to the branch with impunity; but in consequence of the wound by the knife, the poisonous effluvia was suffered to exude and exert its fatal effects upon the innocent visitors.

In my former communication it was mentioned that the garret of a friend was occupied by a family of bees; they'took possession of the tenement in June 1825, and first formed in a body on the side of the chimney. They first made their entrance through a crevice under the edge of the shingles, but an aperture was bored for their use a little below the roof which has proved sceeptable to them. They now occupy the space between the chimney and the upright gable end of the house, open at both sides of the chimney for the space of about 7 inches in width. They have suspended their comb in lengthened sheets extending about two feet below the aperture, carefully leaving a space round it to pass and repass. The quantity of comb, would, it is supposed, nearly fill a barrel, and the landlord receives his rent from the produce of his tenants at his own discretion, selecting the young comb containing transparent virgin boney. They have never swarmed, as they have ample accommodations for their stock of honey and their young brood.

There appears no circumstance in the arrange ment of an apiary so difficult and at the same time farmers in the vicinity.

ring, in which the bees had taken care to leave so important as that of guarding against the depredutions of the bee moth; every cultivator of bees complains that more or less swarms become vic. tims to this enemy every season, in despite of all their efforts to frustrate its invasion,

The fact above detailed of the successful local tion of a swarm in a garret, might suggest an impertant improvement in the arrangement of acapiary Let the hives be placed in the upper apartment of a dwelling house, or some out build. ing provided with proper apertures through the walls. In this situation the becs would be secure from the vicissitudes of the weather, the hives would be less liable to decay, and the expense of a common bee house would be saved. But the most important advantage would be that of a total security against the attacks of the mischieveus bee moth, as that insect seldom or never perambulutes to any considerable height in the otmosphere, and there could be no sweet odour from the hives to allure the insect to the place to see! for its favorite food. It is moreover not impossible but that young swarms from the hives so situ. ated may attach themselves to the walls of the the garret above mentioned, and thus in process of time the whole apartment be converted into a convenient and profitable apiary. Should these suggestions elicit the observations of some judicious and experienced cultivators, the object of Old Colony, Dec. 17, 1827. MEDICUS.

OATS.

MR FESSENDEN-There is a difference of opin. ion among farmers as to the proper time for sowing oats While some contend that it is best to sow as soon as the frost is out sufficiently for the land to be werked, others insist on a different course, and choose not to sow until the ground has become quite dry and warm. It may be a fact that late sowed oats in some and perhaps in most instances, produce a greater quantity et straw than those early sown, and it may be and probably is true in as many instances, that the grain is proportionably lighter, so that if weight of grain is the prime object, that course of procedure as it respects sowing, is best, which is most likely to produce the desired result.

There seems to have been a general failure in the crop of oats through this part of the country the past season, there being but few instances. where they are so heavy by one third, as they have been in other years, when no calamity has befallen them.

Notwithstanding the general failure, I had as good a crop of oats the past season, as in any former year, having over one hundred bushels. from little more than two acres of ground, weighing thirty-three lbs. per bushel. Such being the fact, it is a question with myself and others, what should be the cause of my obtaining a better croo than any other farmers in the neighborhood .-That which to me appears as the probable and only cause, is early sowing. Although my ground was in no better condition than land in general, ? sowed my oats several days earlier than other

" See page 162 of the current vol. of the N. E. Farmer. † In speaking, we believe, of this insect, M. Reaumur says,

" the Bees would readily destroy these creatures, were it not for the armour they are covered with. They form themselves a coat of armour of a double matter. The first, next to the body, is a kind of silk of their own spinning; and the outer covering is of bees wax, laid on considerably thick. The creature, just thrusting its head out to feed, goes on devouring the cells; while the bees are buzzing about him, attempting in vain to pierce him with their stings. He never forsakes his covering, but lengthens and onlarges it as he goes; and gnawing down the sides of the cells in his march, without staying to eat them one by one, the destruction he occasions is scarcely to be conceived." Editor of the N. E. Farmer.

There were several fields contiguous to mine, where the soil and cultivation were not essentially different, but which were sowed a few days later, which in every instance failed to produce a middling crop. I have always been in the habit of aowing my oats as soon as possible after the ground had become settled, believing it to be the better way, and observation and experience the past season, have only strengthened my belief, that such a course is the correct one.

A. FARMER.

Remarks by the Editor .- Deane's N. E. Farmer the spring after the ground is thawed and become this head. dry enough for sowing. The English farmers sow them sometime in February." Loudon says "The season of sowing oats is from the last week in February to the end of April. About the middle of March is preferred by the best farmers." We believe, as a general rule, neither oats nor any originated in a field about two miles from my reother sort of spring grain can be sowed too early sidence, whence I obtained it, and called it by the after the ground can be put in order to receive latter title. I have also noticed, that a peach, the seed in the spring. Early sown spring wheat as well as oats is much less liable to blast than

FRUIT TREES.

Linncean Botanic Garden, } Dec. 11, 1827.

Dean Sin-I send you herewith some parts of my Treatise, now in press, which you can publish as " Extracts from Prince on Horticulture."

Yours most respectfully, WM. PRINCE.

NOMENCLATURE OF FRUITS.

During a number of years, the author has been engaged in a most extensive and general investigation of all the fruits that have been introduced to this country from abroad, in order to test their accuracy, and the correctness of their names .-This critical inquiry has convinced him, that not England or France. less than one hundred varieties of the different fruits at present cultivated in this country are incorrect, as to the identity of their names, and consequently quite different from those they are intended to represent. This has arisen either from errors being made when they were sent from Europe, or by established names being adopted here for doubtful fruits. The nuthor himself has, in common with others, been grossly deceived in the varieties of fruits from Europe, even when received from the best nurseries of England and France. This has long since led him to scrutinize every variety he receives, and the original tree is invariably planted out for bearing, that its accuracy may be tested. The author has gone into these remarks, to account for any present differences which exist between fruits from his establishment, and others bearing similar names, as above one hundred kinds will be found to essentially differ both in appearance and quality. Those persons who are conversant with Duhamel, the Luxembourg Catalogue formed under the auspices of the French Government, the Bon Jardinier, and other Frenah publications; or with Miller, Foreyth, Speechley, and the publications of the London Horticultural Society, can have the identical fruits sept them that are described in those works, and, in every case, the identity is guarantced.

SYNONYMS IN FRUITS.

The author is taking extreme pains to regulate these properly and conclusively, as so much of the success of horticulture depends on critical accuracy. The Catalogues of his establishment bear witness to his anxiety, that the same fruit should never be disseminated under a plurality of names, and it contains more synonyms attached to the respective fruits than any other publication existing; but the author intends, in his " American Horticulture," to extend this necessary part of horticultural information, so as to set at rest a great many of the errors which have hitherto exstates that "Oats cannot be sowed too early in isted, in consequence of a want of information on

I was highly amused, on calling to see a peach which an acquaintance of mine called by the charming name of "Maria Antoinette," to discover, that it was the identical fruit which has been long sold as the "Yellow Rareripe," and which which is now selling as a new variety, by the high sounding name of "Emperor of Russia" is such as is put into the ground late in the season. the same fruit known for 30 years past under the unpretending title of "Serrated Leaved Peach." Various other instances of this kind have come within my notice, which it is unnecessary to enumerate. There is nothing more calculated to lessen the satisfaction of the horticulturalist than this rechristening of old and well known fruits, either by the name of the person who happens to find a tree growing in his garden, or with some funciful productions of his imaginations, as it will create the same endless confusion that has for a long period existed in England, and which their Horticultural Society is now attempting to remady for it is a fact which can be proved, that many of the fruits of Europe may at present be obtained with more accuracy from some of the American nurseries than they can, in most cases, either in

ACCLIMATION OF FRUITS.

Deciduous trees, natives of the same latitude, are far more hardy than evergreens; which proves that the foliage of the latter possesses, even in winter, a great degree of sensibility. Efforts, therefore, to naturalize the fruits of the warmer climes, should be in preference commenced with those which are deciduous. The deciduous trees of Portugal, Italy, and Spain, and of South Carolina, Georgia, and Louisiana, will endure the winters of New York, when the evergreens, from the same places, perish if unprotected. Though in England, where the winters are more moderate, New England Farmer. these survive and flourish, while, from the want of heat in their summers, many of the deciduous trees do not ripen their wood sufficiently to support their climate in winter; whereas, beneath the powerful sun of our country, the wood becomes so well matured, that, it in many instances, resists the rigours of our winters uninjured. A consideration of these circumstances, and effects of climate, may greatly aid those concerned in the acclimation of trees calculated for fruit or for ornament.

NURSERY SOILS.

As a prejudice has provailed from time immemorial, that trees, like cattle, when removed from a rich to a poorer soil, cannot thrive; and as nur- the stopper and fixed on a leaden strainer, and

sery grounds are generally supposed to be kept in the richest possible state, it is a duty which the author owes to himself to remark, that, for many years, he has not made use of as much manure on his grounds as is commonly put on the same quantity of ground by farmers in their usual course of agriculture-not from any belief in the above mentioned doctrine, but from motives of economy, resulting from actual experiment, he has aubstituted culture for manure, by having his grounds, previously to planting, ploughed more than twice the usual depth, and by having the ground each year dug alongside of the rows of trees. By this management they are continued in the most thrifty state until the period for transplantation. The doctrine of trees not thriving when removed from rich to poorer soil, has long since been exploded in Europe. Marshall, a celebrated English writer, is very particular on this aubject, and gives instances that have come under his observation to prove its fallacy, in his "Rural Economy of the Midland Counties of England," vol. i. p. 85. It is absolutely necessary that the young trees, at the time of transplanting, should be vigorous and thrifty, and it is of no consequence whether this is produced by strength of soil or by culture, as the young trees will then have a constitution prepared to feed itself on coarser food.

To those who insist on the point that nurseries of trees should be reared on poor ground, the reply may be made, that it might, with equal aptitude, be asserted, that a decrepid man is the best calculated to sustain the toils of a journey.

ORCHARDS NEAR THE SEA-SHORE.

It is recommended, in localities wholly exposed to the ocean-such as Nantucket, and other islands-that those who desire to succeed in cultivating fruits, should first plant a row of red cedara, willows, or other hardy trees, to break off the gales; next to these, they might plant their pears, as the fruit best calculated to support the situation, and after them peaches, and other fruits; perhaps it would be better that the cordon of cedars, willows, &c. should be extended on three sides of the plantation. As the red cedar flourishes uninjured on the sea-shore, and from its being an evergreen, is capable of affording protection against storms in all seasons, I consider it as decidedly the most proper to be selected for the hefore mentioned purpose.

ON RAISING WATER FROM WELLS.

Mr Fessenden-If you think the following account of my manner of bringing water into the yard, will contribute anything to the convenience of farmers, you are at liberty to insert it in the Yours, &c. N. L.

Lyme, (N. H.) Dec. 26.

Last autumn, wishing to have water constantly running to my barn yard, and pasture contiguous, I went back about 18 rods to ground 44 feet higher than my yard, there dug and atoned a well 20 feet deep, and dug a trench 21 feet deep-placed in it' a small leaden pipe-stopped the lower end of it, and let it extend up beyond the well'a mouth, so far that when bent and inserted, it would reach to the bottom-then filled the pipe with water for the purpose of exhausting the air (having no other convenient way of doing it)-stopped the upper end till the pipe was carefully bent, and the end put under the surface of the water, then took out

fastened a cord near the end of the pipe, and let |candidate, playing at cut and thrust in the politicit down nearly to the bottom of the well-confining the other end of the cord to a stick fixed across the well, near the top. The use of this cord is to raise the end of the pipe, in case we find at any time by measuring, that the sand is washing inand liable to cover the etrainer, and thus stop the water. Then by removing the stopper from the lower end, the water began to run, and has continued running a small atream ever since, without danger of exhausting the well, which, in the present wet season, contains fifteen feet of water,

From the New York Statesman.

AGRICULTURE.

We are happy to perceive by the subjoined correspondence, that the spirit of improvement in agricolture, cherished by the munificence of the Goverment, and widely diffused through the medium of societies under its patronage, is not yet extinct though it seems to have slumbered for a year or two, while public attention has been engrossed by canals, rail-roads and other plans for promoting the interest of the state. The former ought to have been done, and the latter not left undone. Agriculture must for centuries be the great source of wealth and prosperity in the United States. Commerce and manufactures cannot flourish, if this paramount interest, whence they draw their life and activity, be permitted to languish. We have always had full faith in the salutary influence of agricultural societies; and it is with us a subject of deep regret, that the enthusiasm by which they were actuated a few years since, has in any degree subsided. Brief as was " the full tide of successful experiment," and sodden as has been its reflux, it was like one of those inundations of the Nile, which bring down fertility and plenty. The traces of the vivifying and invigorating principle are visible over the whole surface of the state; and in many instances, waste places have been converted into productive farms. Look, for example, at the rural retreats of the late Chief Justice and his neighbour Judge Buel, whose fertile acres were reclaimed by the hand of persevering industry. If such an impulse was communicated to agriculture by a few seasons of active exertions, what effects might not be produced by systematic and continued efforts, such are made in Great Britain and in some parts of our own country? We have all the elements of one of the richest agricultural countries in the world, with every possible facility of transporting produce to a ready market. With such peculiar advantages, and with a population rapidly increasing, the state of New-York presents the strongest inducements for improving every acre of its soil.

In giving publicity to the following letters, we will merely add, that it will afford us pleasure at all times to make the Statesman the medium of similar communications, believing that if we may be the means of "making two blades of grass grow, where but one grew before," a service more beneficial to the community will be performed, than by filling our columns with angry discussions on the subject of the Presidency. Without censuring any of our editorial brethren, who have a taste for the termoils of party strife, we can only say for ourselves, that we would rather be found

"Roasting turnips on a Sabine farm" than engaged as heated partisans for this or that ficient pasturage. - Editor.

al arena, for the amusement of the public :

New York, Nov. 26, 1827.

DEAR SIR-When I was at your farm last sumculture, uses and value.

Hon. JESSE BUEL, Albany.

Albany, Dec. 7th, 1927. DEAR SIR-I most cheerfully comply with your

request, in communicating my experiments in the culture of Lucerne.

in 1820. I sowed it with summer grain, but too managed like clover-lay a few hours in swath, fourth of the plants survived till autumn. ploughed it up at the end of the second year.

In 1824 I sowed 16 lbs. seed on an acre, well prepared by manure and potatoes the prepeding year, with half a bushel of winter rye, the whole broadcast. The ground was well harrowed and rolled after it was sown. The ryc soon spread its leaves upon the surface, and protected the Lucerne until its roots had good hold of the soil. It grew well, notwithstanding the drought. The latter end of August, perceiving that some of the rve was pushing up seed stalks, and that some weeds were overtopping the grass, I mowed it, and fed it green to my eattle. In 1825, I cut three tolerable crops, and soiled it to my cows .-In 1826. I cut it tour times for green fodder, and in the autumn gave the field a slight top dressing of rotten dung. This year my stock has consisted of six cows and four oxen. My summer pasture would not more than suffice for two of them .- I fed them on ruta-baga and hav until about the 20th May, when I commenced cutting and feeding my Lucerne, morning and evening, in such quantities as I found my cattle would consume. By the time I had cut over the acre, the part first mown was again fit for the scythe. Two cuttings with the small pasture in which the cattle run, sufficed until my meadows and grain fields were fit to turn into. A third crop was cut for hay, and fourth might have been cut also, but for the difficulty of curing it. This is the field which you saw when at my

* The botanical name of this plant is medicago sativa. It is a native of Spain and the south of Europe. It grows to the height of from one to two feet, and the flower is of a pale blueish purple. The term "soiling," made use of in this correspondence. may not be familiar to all our readers. It is applied to the feeding of cattle confined in narrow enclosures, not affording suf-

It should be sown only in the spring, when the Your experiments have, no doubt, been made ground has acquired warmth sufficient to promote

will oblige me by furnishing the statement, it will blossoms appear; and be permitted to wilt a few gratify me to be the medium of communicating it hours in the swath before it is fed to neat cattle. And lastly, like all other crops.

It is benefitted by an occasional dressing of manure. I think the best way is to apply compost of short dung in autumn, and harrow with a light harrow in the spring.

When cut for hay, there is a difficulty in curing Lucerne without great loss, as the leaves dry and My first essay to cultivate this grass was made crumble before the stem is cured. It should be thin; the summer was dry, and not more than a and then put into small slender cocks with a fork. I It will care in two good days. I mixed my autumn crop, in the barn, with alternate layers of 'straw. Your ohd't servant. J. BUEL.

ISAAC M. ELY. ESO.

CONSTANTINOPLE.

The climate of Constantinople, for the latitude, is one of the coldest places in Europe, as the prevailing winds are north and south, blowing directly through the Bosphorus. A modern traveller has aptly compared a resident at Constantinople to a man in a thorough draft, or standing at the muzzle of a pair of bellows. Vegetation is scarcely a fortnight forwarder than in England, and fires are agreeable in the middle of April. Although the neighborhood of this city exhibits as rich a verdure as could be seen in the first dairy countries in the world, yet butter can scarcely be procured, and the milk is not drinkable. The meat, from bad management, is likewise very inferior; lamh is not allowed to be killed till the end of May; pork, when in season, is excellent; and though the butcher pays an enormous sum for the privilege of selling it, the price does not exceed 3d. per pound; of fish, there is a great abundance, and of the most extraordinary colours and shapes, but in general very inferior to what is caught on our coasts-the shell-fish in particular, is almost without flavor.

Bologna Sausages .- All the world are aware that these sausages are esteemed the nicest, if not the most delicate food that can be eaten; yet they are made with ass's flesh. Xenophon, in his Anabasia, remarks that the flesh of the wild ass was esteemed a delicacy by the army; and in the history of Belisarius's wars, we find mention of sausages made from the flesh of mules that had died of the plague .- London Weekly Review.

From Loudon's (London) Gardener's Magazine.

On the mode of procuring a crop of cucumbers during winter, by forming the hot bed within a vincry.-The gardener that is most successful in growing early cocumbers, is generally considered clever in every other part of his business .-This is not altogether without reason, for the man who bestows the necessary attention to keeping up the proper degree of heat, giving and taking away air, covering and uncovering, &c., to a cucumber frame, during the winter months, is likely to be of regular habits and careful attention, and these qualities go far tuwards the ensuring success in whatever is taken in hand.

The duties of gardeners in small places near large towns, are generally very different from those of their brothren, in the country. In the former case, their attention is confined to a few objects, and of course greater excellence is attained; in the latter, the gardener has often the charge of extensive ahrubberies, park scenery, and distant plantations; - and these necessarily take him away a great part of his time from the kitchen garden, and leave him dependent upon his assistants. It was the experience of the uncertain results connected with this dependence, which led me to the plan of placing my winter eucumber bed in a vinery, and to manage the vinery and bed in the manner I am now about to describe.

This vinery was forty feet long, sixteen feet broad, twelve feet high at the back, and five feet and a half high in the front, with one fire place, and a fluc which passed round the house. The air could be admitted both by the top and front lights.

On or about the 20th of September, cucumber seeds were sown on a moderate hot-bed in the open air, and treated in the usual manner until they were ready to ridge out. This generally happened about the beginning of November, at which time the shoots of the vines were withdrawn from the house, and a dung bed formed in the floor in the usual way. After placing the frame and mould on the bed, it may be left without the lights till the rank steam has passed off .-After this the plants being placed in the hills, and the sashes put on, the following are the leading leatures of management during the winter: --

Make fires in the evening, so as to warm the air of the house to from 56° to 60°, and in very severe frosts it may be raised to 70°. In the mornings of the coldest weather, and shortest days, make a strong fire, so as to raise the heat to nearly 70°, when the house is shut up. About eight o'clock and from that time to half-past nine, give plenty of fresh air, by opening the front sashes and top lights, after which, and during the remainder of the day, give plenty of air to the cucumbers, by tilting the sashes in the usual way.

In mild weather and during sunshine the lights may be taken entirely off the cucumbers for some hours each day; and immediately after forming new linings, the top lights may be left down a little all night, to permit the escape of any rank

The advantage of this mode of growing cucumbers during winter is the comparative certainty of an early and good crop, at one third of the trouble and expense of the common method out of doors. fined situations - Gard. Mag. The expense is lessened by no covering up being required, and by all the labour attending renewal

By this practice fruit may be cut in January .-The vines may be introduced in the beginning of March, and will break beautifully and regularly in consequence of the genial steam of the dung. In April the shade of the vine leaves will have rendered the house too dark for the culture of the cucumber, and, as by this time cucumbers are plentiful in the common hot beds out of doors, the bed in the house may be cleared out, and the vines treated in the usual way till the following Novem-Yours. &c. J. REED.

On the Varieties of Cardoon, and the Methods of cultivating them. By Mr Andrew Matthews.

The cardoon is not very generally cultivated in English gardens, probably, as Mr Matthews con jectures, because "it requires more skill in the cooking than is commonly applied to it." It is a good deal in use in the South of France, as about Tours, where it is used in soups and stews, and sometimes in salada. The sorts described are the common, Spanish, Cardoon of Tours, and Red Cardoon. The Spanish, Mr Mathews considers the best, and the culture of any of the sorta he states to be particularly easy. Sow about the middle of April, in deep, light, not over rich soil, in trenches about six inches deep, by twelve inches wide, and four feet distant centre from centre. Drop three or four seeds together at intervals of eighteen inches, and, when they come up, thin them out to single plants. Water frequently during summer; and, in a dry day about the end of October, commence the operation of blanching, by tying up the leaves with twisted hay bands, after which earth may or may not be heaped round them in the manner of landing celery, according as they are to he used early or during winter .-The common practice is to tie slightly with matting in the beginning of October, and earth up once a fortnight, till the plants are sufficiently covered, in the manner of celery. The French mould up the bottom of the plant a little, then tie up the leaves with packthread, and thatch them with long clean straw, made fast with strong mat- tract of bark from the mimosa, and other trees of ting, or small ropes. The hay band method is the best-

Cardoons may be transplanted in the manner of celery, but they are found to do much better when sown where they are to remain. In France the flowers are gathered and dried in the shade, and used instead of rennet to coagulate milk.

Insalubrity of the neighborhood of dunghills.—A writer in a French agricultural journal points out, with great force, the injury done to the atmosphere, as far as respects the breathing of animals, by the decay of animal and vegetable matter in runghills, ditches, ponds, wells, and especially in sewers, and the cess-pools of water-closets .--Wherever health is an object, he recommends neutralizing the mephitic exhalatious which arise from these places, by daily strewing over them; from a dredgebox, powder of lime, of which a very small quantity is said to have the desired effect. Though there is nothing new in this, yet it affords important hints for those who are employed to arrange the detail of dwelling-houses, and outof-door-offices; and also to those who live in con-

Colchicum.-In the British newspapers a case

of linings, &c. &c. admitting of being done in wet was lately related, in which the bulbs baving been eaten by, a family, boiled along with potatoes, proved poisonous; and a French veterinary journal relates the case of twelve cows, which had been fed with the leaves and seed-vessels, and soon after showed the most alarming symptoms. By the use of strong decoctions of linseed, they were recovered after two or three days .- Bul. Un.

> Mouldiness in the timber of a house, it is found, may be prevented by washing it over with a weak solution of muriate of mercury. The repair of a church at Potsdam, the timber of which, though quite new, was covered with mould, gave rise to the discovery .- Bul. Un.

> Emigration to the Canadas .- Unquestionably. no man who is willing to make the slightest exertion can starve in America. If he will undertake to clear a farm, the means of subsistence are at once secured; should his habits unfit him for such an undertaking, the price of labour is so high, he is sure of lucrative employment in whatever capacity he chooses to enter the service of a master. So far the prospects of the emigrants are encouraging and agreeable.

But let us turn for a moment to the other side of the picture. Let us contemplate the exile seeking the portion allotted to him in the wilds of the forest, with the compass for his guide, doomed to endure, in his wretched log but the rigours of a Canadian winter, without a human being for many miles round to break his solitude, or assist his labours. No village, no shop of any description, no medical advice within his reach, and worse than all, the lonely tenant of the woods is generally remote from any market, where he may dispose of the hard-earned fruits of his labours.

Personal Narrative of M. de Roos,

Australian Agricultural and Horticultural Society, August, 1826 .- Premiums were offered for various agricultural productions, and for the best treatise on Australian agriculture; the best treatise on Australian gardening; a treatise on the best and most economical mode of preparing exthe colony; on the best and most economical mode of preparing the potash of commerce from the woods of the colony; and on the best mode of preparing the castor oil from the seed of the Ricinus communis.

The Honorable Alexander M'Leay, F.R.S. &c. formerly Secretary to the Linnman Society of London, is the Vice-Patron of this Society, and, among its Committee, we observe the name of Robert Townson, L. L. D. the celebrated author of Travels in Hungary .- Colonial Times.

Australian Agricultural and Horticultural Society, February, 1827 .- A report was read, by which it appears that the crop of wheat was above an average, and the crop of maize promised to be abundant, where it was sown in rich alluvial soil, but a failure on fresh land. Tobacco is said to be less extensively grown, since the reduction of the duty. The condition of the vineyards is mentioned as extremely luxuriant. The influence of the turf-club, in encouraging the breed of horses, forms a subject of congratulation, as also the increasing numbers, and the improvement in quality, of the breeds of horned cattle. An improvement of the quality of wool produced from sheep of the Saxon breed is also noticed .- Col. Tines.

TRAPS FOR HAY-STEALERS.

Have the grewer's name printed or written on a great number of little slips of paper, distribute these in the hayrick as it is building, so as there but to make quite sure, say two hundred. Then at the end of several months. when you suspect your man has given away a truss, or any particular truss or quantity to be stolen from your cart or rick, have the truss polled to pieces, &c. This practice has been adepted in Shropshire, and a thief detected and convicted in consequence. The ingenious inventor is Mrs Richards, of the parish of Clun.

LACKAWANA COAL MINES.

These Mines, with a body of land attached thereto, we are told, sold for one hundred and forty thousand dollars! One hundred thousand of which were paid by Stock of the Hudson and Del aware Canal-and forty thousand in cash.

Carbondale is the name given to the Coal Mines, formerly belonging to Maurice and Wm. Wurtz, Esqs. now owned by the Delaware Hudson Canal Company. It is situated on the Lackawana river, Blakely township, Luzerne county, 32 miles from Wilkesbarre, 8 miles from Dundaff, the late seat of the Northern Bank of Pennsylvania, and 16 miles from the Dysburry Fork of the Lackawaxen, to which place a turnpike road is now completed, and a rail road in contemplation. At this place, the canal up the Lackawaxen will terminate for the present. The Mines are handsomely opened, the coal appears to be of an excellent quality, and about five and twenty operatives are employed in uncovering and raising this valuable article; and in erecting Saw Mills, and other improvements, about the same number of workmen are employed. The Delaware & Hudson Canal Co. have issued bills in the nature of bank bills-which have a currency superior to that of the Northern Bank in its best days and we are pleased to say that the operations of the Coal Mines, and on the canal now constructing on the Lackawaxen, afford a market for the surplus produce of the agriculturists in the counties of Luzerne and Susquehannah; and assure the landlord and the cultivator, that the land and its products will rise its value .-Village Record.

Every family to make their own sweet oil .- This may easily be done by grinding or beating the seeds of the white poppy into a paste, then boil it in water, and skim off the oil as it rises; one bushel of seed weighs fifty pounds, and produces two gallons of oil. Of the oil sold as sweet olive oil, one half is oil of poppies. The poppies will grow in any garden-it is the large headed white poppy, sold by apothecaries. Large fields are sown with poppies in France and Flanders, for the purpose of expressing oil from their seed .-(Vide 10th and 11th vols. of Bath Society Papers. where a premium of twelve guineas is offered for the greatest number of acres sown in 1808 and 1809.) When the seeds are taken out, the poppy head, when dried is boiled to an extract, which is sold at two shillings sterling per onnce, and is to be preferred to opium. Large fortunes may be acquired by the cultivation of poppies .- English Receipt Book.

To preserve oranges, lemons, and other fruit-Take small sand and make it perfectly dry; after it is cold put a quantity of it into a close clean sphere of its action.

vessel; then take your oranges, and set a laying of them in the same, the stalk end downwards, so that they do not touch each other, and strew in defatigable industry-and natural advoitness in some of the sand, as much as will cover them two making the most of every gift of noture bestowed may be at least one slip to each truss, which will inches deep; then set your vessel in a cold place, not require above one hundred slips to an acre, and you will find your fruit in high preservation tal vegetables engross their care; and animals

> Tricks of Fruiterers .- In many of the London fruit shops, yellow grapes have their bloom restored by being funnigated with aulphur; and some fruiterers of little repute are in the habit of supplying a bloom to plums, by dusting them with the The last operation is, in general, so clumsily performed, that it may be easily detected.

Storch, in his Description of St Petersburg, montions some of the tricks that are performed on culinary vegetables and fruits in that city, but they are in general too gross, and involve too much manipulation, for being practised in Britain. For example, after asparagus has been used at the tables of the great, the returned ends of the shoots are sold by the cook to itinerating green-grocers, who carve a new terminating bud, colour it, and add a bloom, in imitation of nature, make up the ends so prepared in bundles, with a few fresh stalks outside, and sell the whole as genuine asparagus.

CURE FOR A COLD.

The following receipt to cure a cold is said to be so efficacious, that we republish it at the request of a correspondent who has tested its virtnes .- Am. Farmer.

Take a large tea spoon full of finx-seed, with two penny worth of atic liquorice, and a quarter of a pound of sun raisins. Put it into two quarts of soft water, and let it simmer over a slow fire, till it is reduced to one; then add to it a quarter of a pound of brown sugar candy, pounded, a table spoon full of white wine vinegar, or lemon juice. Note-The vinegar is best to be added only to that quantity you are going immediately to take; for if it be put into the whole, it is liable in a little time to grew flat. Drink a half pint at going to bed, and take a little when the cough is troublesome. This receipt generally cures the worst of colds in two or three days, and if taken in time, may be said to be almost an infallible remedy, It is a a sovereign batsamic cordial for the lungs, without the opening qualities, which engender fresh colds on going out. It has heen known to cure colds, that have almost been settled into consumptions, in less than three weeks.

Salubrity of the London air .- It was a saying of Mr. Cline, many years ago, that, "London was the healthiest place in the world." In no place are there so many human beings congregated together enjoying so high a degree of general good health. It has been stated, and we believe, correetly, that the happy exemption, which the inhabitants of London, for the most part, enjoy, from the diseases common to other capitals, is owing to the sulphurous naptha emitted from the coal, serving the salutary purpose of checking the progress of febrile affection. To prove that the air is saturated with the naptha, we shall not be able to recognize the presence of a wasp, an insect to which sulphur is obnoxious, within the

Chinese mode of fattening fish .- The Chinese are celebrated for their commercial acumen, inon their fertile country. Useful as well as ornamenwhich are the most profitably reared, and which vield the greatest quantity of rich and savoury food, are preferred by them for supplying their larders and stews. When a pond is constructed and filled with water, the owner goes to market and buys as many young store fish as his pond can conveniently hold; this he can easily do, as powder of the common blue used by laundresses. almost all their fish are brought to market alive. Placed in the stews, they are regularly fed morning and evening, or as often as the feeder finds it necessary; their feed is chiefly boiled rice-to which is added the blood of any animals they may kill, wash from their stewing pots and dishes, &c. indeed .-- any animal offal or vegetable matter which the fish will cat. It is said, they also use some oleaceous medicament in the food, to make the fish more voracions, in order to accelerate their futtening. Fish so fed and treated, advance in size rapidly, though not to any great weight; as the perch never arrive at much more than a pound avoidupois; but from the length of three or four inches, when first put in, they grow to eight or nine in a few months, and are then marketable. Drafts from the pond are then occasioually made; the largest are first taken off, and conveyed in large shallow tubs of water to market; if sold, well: if not, they are brought back and replaced in the stew, until they can be disposed of.

PROFITABLE DAIRYING.

The following proceeds from twenty-five Cows, the last sesson, we have from the owner, Mr Jonathan Dyer, of Clarendon. Such enterprise is worthy of imitation.

6017 lbs. Cheese wort	h 64 cents	375 10
450 lbs. " "	4	18 60
1000 lbs. Butter, "	123	127 50
Proceeds from the sale	e of Calves,	50 00

Mr Dyer further assures us that the whey and butter-milk amply paid for making and all contingent expenses. The cows had no extra keeping, but were doubtless well attended to.

Antidote against poison .- A correspondent of the London Literary Gazette, alludes to the numerous cases of death from accidental poisonings, and particularly to the melancholy fate of the Royal Academican, Mr. Owen, adds, "I may venture to affirm, there is scarce even a cottage in this country that does not contain an invaluable. certain and immediate remedy for such events, which is nothing more than a desert spuonfull of mustard, mixed in a tumbler or glass of warm water, and drank immediately ;-it acts as an instantaneous emetic; is always ready, and, is used in safety in any case where one is required. By a mistake, where a gentleman took a full ounce of poison instead of salts, the castors were fortunstely at hand, and no doubt an invaluable life was preserved to his family by giving the mustard directly. By making this simple antidote known, you may be the means of saving many a fellow being from an natimely end."

NEW ENGLAND FARMER.

EOSTON, FRIDAY, DEC. 28, 1827.

We are obliged to defer till next week, F. H. P. and some other articles.

FARMERS' ACCOUNTS.

Every farmer who desires to know correctly to what profit he does business, should provide himself with a book, which he may call his General Stock Book-and in this book, some time in December, he should register the result of a general survey of the condition and worth of his whole stock and property-of his debts and credits .-Having such a book to refer to at all times, and on all occasions, will afford much satisfaction to his mind. In the first place, he should order in all tradesmen's bills, and in the mean time be may take an examination and account of all his household goods, horses, cattle, poultry, corn, grain, in straw or threshed, hay or other fodder, wood, manure, wagons, carts, ploughs, and implements of all kinds the state of his fences, gates, drains, &c.; and make an estimate of the necessary repairs. Minutes being made on waste paper, the particulars may be afterwards entered into the Stock Book with such a degree of minuteness as may be judged necessary. After this general register, a Dr. and Cr. account may be drawn out, the balance of which will exactly show the present worth of his estate. The form of the account may be as fo'lews :--

Stock Dr. Contra Cr.

On the Dr. side should be entered all the farmer owes, and on the Cr. side all he possesses, and all that is owing to him. He must rate every thing at what he judges to be the fair present worth, (was it then sold); manure and tillage performed must be valued at the common rate of the

- If a farmer wishes to be very correct in his calculations of the profit and loss, upon a lot of stalled oven, for instance, on the crop of any particular field, his readiest method is to make an account for either one or the other in his leger of Dr. and Cr. On the Dr. side let him place the would be to sow it with clover or some other succost, including every minute particular, and on culent grass, the Cr. side the returns. On the sale of the articles, the account is closed, and the balance demonstrates the profit and cost.

PARSLEY. (Apium petroselinum.)

This well known garden-plant, is, in England, a subject of fiell cultivation. It is a native of Sicily, but will endure the winter of our climate. Mr. London says, "Parsley is sown along with clover A writer for the Farmer's Magazine, (Scotland,) says, "a friend of mine having occasion to observe the partiality of black cattle for the common garden parsley, and their preference of it, when growing, to almost any other green food, took it in his head to try how it would succeed in a field that he was going to sow down for pasture. He

the other two. We know that black cattle, sheep, confidence, both because I was requested to pubknow, also, that parsley is a most wholesome ve- the just proportion and proper symmetry of every Practical Husbandry, vol. iii.] is of opinion, that For any one reading the description of a particuthe plants will flourish better, grow to a larger lar part, for example, of the breast; be will there distance between the rows be sufficient to admit before the legs; and on turning to the print he a hoe-plough. He adds, that a smaller quantity will immediately see this projection shewn in the of seed will be required, the culture will thus be side-view of the bull, and the width in the heifer, less expensive; and, he is confident, the plants which faces him; and so on with respect to every will afford a better food for cattle.

sheep, and it not only renders their flesh more point which is not fully presented to the view." delicious, but is also believed to preserve them A gentleman, who is friendly to our Establishagainst the rot. Instances have occurred, where ment, and a well wisher to the great interests to in the vicinity of the farm were uniformly subject copy of the Print above described, which we have to that disease. mends these animals to be fed with it, twice in inspection of any person who will take the trouble the week for two or three hours at each times .-It may likewise be beneficially given to sheep affected with the scab or red-water, and is said to be very efficacious in recovering surfeited horses, or such as are subject to the grease."

Another English writer says that parsley should be sown among oats and fed the following year with sheep. Two hushels of seed to the acre is the quantity recommended when no other grass seed is sown; but, probably, the management much water as will reduce the composition or

Loudon says that paraley " is sown along with clover and grass seeds in some places, and especially in Lincolnshire, as a preventive of the rot in sheep, &c. In laying down lands to grass, Hoyte twelve pounds of white clover, two pounds of red clover, two pecks of rye grass, and two pounds of and grass seeds in some places, and especially in parsley to the acre; as the parsley stands two Lincolnshire, us a preventive of the rot in sheep." years, and by its diuretic qualities, prevents the sheep from dying of the red-water, which too luxuriant clovers are apt to produce. The seed requires a longer time to germinate than any other agricultural plant, and might probably be advantageously prepared by steeping."

ELEGANT PRINT OF CATTLE.

In the New England Farmer, [vol i.] we repubaccordingly sowed two or three rieges with pars- lished a pamphlet, entitled, "R-marks on the Im- of a remarkable cure of the bite of a rattle-snake, ley seed, and the rest of the field with clover provement of Cattle, &c. In a Letter to Sir John by cupping with a common porter or black bottle. and rye grass. As soon as the field was ready Saunders Sebright, Bart. M. P. by Mr. John Wil. The plan resorted to was, to fill the bottle half for pasture he led his cattle into it, and it was kinson, of Lenton, near Nottingham." In the full of spirit of turpentine, made quite warm, and perfectly evident that they preserved the part work, the following passage occurs, (See page after scarifying the wound made by the snake, to which was sown with the parsley, to any other 252). "Should any difficulty still remain in form, apply the mouth of the bottle to it, and then pour part of the field, insomuch that they never touching a clear conception of the points described. I cold water on the bottle till perfectly cooled. It

He had not un opportunity to try sheep upon it; and that too, without vanity; as it reflects far but the probability is, that they would (if possible) more credit on the artist than on myself. In such have been fonder of it, and thriven better than a recommendation, moreover, I feel the greater horses, and indeed every other noimal, ulways lish it by many of the first agriculturists in the prefer that food, when they have it in their pow-kingdom; and since published, it has met with er to make a choice, that is most ngreeable to their highest approbation. This print consists of them, and most conducive to their health. We a groupe of five animals, so arranged as to show getable for the human species. It is a powerful essential part. The portraits were taken from the antiseptic If we were to reason from analogy, most perfect animals in my possession; and the we should suppose that its beneficial properties engraving, which is in a style far superior to that should extend to the animal creation in general." in which cattle are generally executed, was fioish-Willich's Domestic Encyclopedia, says "Parsley ed with the greatest care. And, if I am correct is propagated by seed, which according to Miller, in my description for the proper formation of catshould be drilled (early in the spring as it remains tle, and the portraits in the above mentioned print several weeks under ground) in the proportion of be also good, I think he who carefully compares two bushels per acre; in rows about one foot the portraits with the description itself, cannot asunder, and hand hoed; though Mr. Mills for his long fail of being at least a very tolerable judge. size, and be in all respects, more perfect; if the find, that it ought to be wide, and to project well other part. For as each animal is placed in a dif-"This vegetable is eaten with great avidity by ferent position from the rest, there is no important

sheep fed in parsley remained sound, while those which our paper is devoted, has presented us a Mr. Mills, therefore, recom- placed in the New England Farmer office, for the to call and look at it.

To preserve eggs sound for the space of two years. For the following process for keeping eggs perfeetly sound, a patent was granted to Mr. Jayne, of Sheffield, in England. Put into a tub or vessel, one bushel, Winchester measure of quick-limethirty-two ounces of salt, eight ounces of cream of tartar, and mix the same together, with as mixture, to that consistence, that it will cause an egg put into it to swim with its top just above the liquid; then put and keep the eggs therein, which will preserve them perfectly sound for the space of two years at the least. This method is not the worse for being simple, and the still simpler one in the fourth volume of Communications to the of merely keeping eggs in salt, is known by many Board of Agriculture, advises the sowing with good housewives to preserve egga quite sound for a considerable time.

> It has been calculated that the manufacture of wool, (including the various mechanics and laborors employed,) in the New England States subsists about 20.000 families, or 120,000 personsand that these will consume the surplus products of 40,600 families of agriculturalists :-together, about 360,000 individuals.

Bite of the Rattle-snake .- An article has been published in several journals, giving the account ed the rest, while there was a single blade of parsthink in such a case, I may very safely recomble to be had. Horses were equally fond of it, mend a print, which I published a short time ago, tient was in the most exeruciating agony, previous to the bottle being applied, but soon became easy, and fell into a sound sleep. The next day he was able to walk about and work as usual. Spirituous liquors of any kind, or even warm water, will do very well, as a substitute for spirits of turpentine.

The writer of this article thinks any kind of spirit would do as well as spirit of turpentine .-This we apprehend may be a great mistake. The latter spirit is exceedingly active and penetrating, and it may be, if the above statement is true, that the turpentine, which seems to have been applied to the wound, prevented the too frequent effect of the bite of the rattle-snake. It might have destroyed this animal poison by chemically decomposing it. We throw out this idea in the hope that those who may have an opportunity of observing the effect of the turpentine in accidents of this kind, may decide whether it has any preventive or counteracting effect in these cases, or not. We have seen many punctured wounds of the feet, to which the spirit of turpentine was applied. The orifice of the puncture was enlarged. No accident followed in a single instance. Whether the turpentine acted as a preventive in any, or all of these instances, it is impossible to say; that it did so, in some of these cases, considering that several of the punctures were deep and painful at first, and made by rusty nails, is only presumptive evidence, more or less probable. The turpentine is coming into frequent and good use, as a remedial substance, both externally and internally, and is well worth a trial in punctured wounds, and in the bite of insects and poisonous reptiles, when something better known and more to be relied on, is not at hand .- Medical Intelli.

To prevent shoes from taking in water .- It is stated in the Family Receipt Book, that one pint of drying oil, two ounces of yellow wax, two ounees of turpentine, and half an ounce of Burgundy pitch-melted carefully over a slow fire. If new boots or shoes are rubbed with this mixture, either in the sun-shine or at some distance from the fire with a sponge or soft brush, and the operation is repeated as often as they become dry, till the leather is fully saturated, they will be impervious to wet, and wear much longer, as well as acquire a softness and pliability, that will prevent the leather from ever shrivelling.

Note. Shoes or boots prepared as above, ought not to be worn till perfectly dry and elastic, other wise their durability would rather be prevented than increased.

Rail-roads .- After all our boasting, if we do not take care, the people of the south, will have the first rail-road-at least the following, from the Southern Patriot, seems to indicate as much:

A bill to incorporate a company to construct a rail-road, between the city of Charleston and the towns of Hamburg, Columbia, and Camden, has been introduced into the House of Representatives, by Alex. Black, of Charleston, which has had the first reading to-day, and ordered for a second reading to-morrow.

er, "A Ride of eight hundred miles in France; containing a Sketch of the face of the Country, its Rural Economy, of the Towns and Villages, of Manufectures and Trade, and Manners and Customs—Also, on Account of the Prices of land, House, To produce this effect, the workmen first saturate the surface with olive oil, and then apply a solution of gum arabic in boiling alcohol. This mode of varnishing is equally brilliant, if not superior to that employed by the French in their mode of varnishing the superior of the Country in their mode of varnishing and country in the making and managing of Hot beds and Green Houses; to that employed by the French in their mode of varnishing the superior of the country in the making and managing of Hot beds and Green Houses; and on the Propagation and Chilivation of the several series of varnishing the country in the making and characters. By william Cobbett—London edition, with several engraviors, price \$1.00.

To make good Cider Cake .- Two pounds of flour, mental Flowers. one of sugar, half of butter, one of fruit, one

The Bristol Tunnel .- We understand that this undertaking is proceeding rapidly, and that the Tunnel is completely finished for the space of a quarter of a mile. The excavators are employed day and night, and every effort appears to be making to complete the work with all possible

In the New York Court of Sessions a few days since, William Brackett was tried for beating a drum; but it was a Mrs. Drum, who had previousdrum; but it was a Mrs. Drum, who had previous-ly beat the prisoner, and whose head "discoursed or hundred weight, for sale at the N. E. Famer office. music," that did not please the court.

The Coffee Bean, "it is generally said, loses its vitality in a few weeks. Some years ago, when I resided in Italy, my children used to sow the beans which we had in daily use, and they grew freely. I suppose they were imported to Leghorn from Africa, but how old they might be I am not able to say. When I mentioned this to a gentlemen curious in botanical matters, he told me he had raised date and cocoa palms from nuts bought in the London shops, but had never tried the Coffee. I should like to know the experience of others on the subject."-C. H. D. March. Since the above was in type, we have seen a young Coffee plant raised from one of a handful of seed, taken indiscriminately from a parcel of Mocha Coffee purchased in the shops .- Cond.

Sheep Stealers .- The Perry (Pa.) Forrester saseth screen hundred sheep has been killed by does in the vicinity of that place within two or three weeks. The shepherds no Salisbury plain, and on the Dorset and Sussex down in England, where vast flocks of sheep are kept, resort to a method for the discovery of does who have acquired habits of worrying their flocks, (a habit by the bye which like most other bad habits is seldom forsaken) as easy and as simple as it is certain. tain. When they find that a sheep has been worried or killed in the night, they go round to all the farms and cottages in the neighborhood, and examine well the mouth of every dog they can find; and the guilty cur is detected by the wool of the sheep; particles of which will lodge between, and adhere to the teeth for several days. It is almost needless to add that in such eases the shepherd assumes at once the office of Judge, jury, and executioner. "Out of thine own mouth will I condemy thee, thou rascally hound," forms the sum and substance of indictment, pleadings, and sentence-and execution inevitably

Rats .- A correspondent sends us an article from the Albany Argus, recommending "ground cork, fried in grease, as an efficacious plan for destroying rats." Several years ago, we tried a similar experiment, but upon the return of dng days we began to have serious thoughts of establishing a hoard of health in one corner of our office.—Bellows Falls Int.

Mr Benjamia Fowler, in Pembroke, this year raised an English turnip, which when divested of its top weigh ed 21 pounds, and measured in girth three feet seven loches.

From the Trenton Emporium.

WINTER.

Time swiftly flies-in bold career, Still circling on from year to year, No pause he makes-o'er town or tower, By night's still couch-at mid day's hour-Still on he sweeps; each matin chime Gives warning of the flight of Time.

But yesterday-cach eye hath seen Nature in youth and beauty green; The cowslip raised its dewy head-The wild rose graced its wilder bed-The laurel bloom and scented thyme, Combined to form a wreath for Time.

But He hath dashed them from his brow, And Winter's treasures deck him now-His locks display the snowy gem, Diamonds of hail his diadem, And Winter, from his frozen clime, Follows,the wasting flight of Time.

WISE SAYINGS OF POPE.

1. Fine sense and exalted sense are not half so useful as common sense. There are forty men of wit to one man of sense; and he that will carry nothing about him but gold, will be every day at a loss for want of readier change.

2. A man should never be ashamed to own he other words, that he is wiser to-day than he was yesterday.

3. To be angry is to revenge the fault of others upon ourselves.

4. To relieve the oppressed is the most glorious act a man is capable of; it is in some measure doing the business of God and Providence.

5. When we are young, we are slavislily employed in procuring something whereby we may live comfortably when we grow old; and when proposed.

6. The world is a thing we must of necessity, either laugh at or be angry with; if we laugh at it, they say we are ill-natured.

A quaker gentleman covered with his beaver, was once in company with a lady rather too much uncovered, who drank to his "broad bottomed beaver." Tim quaker having thanked her for the honor she did him, observed, filling up a time when a man has a right to value himself, it bumper, "in return for thy civility, Maria, I drink is when he has done a good action in a proper thy absent handkerchief."

the simplicity of a rnw Pat, who had just been transplanted from the interior to Dublin :-

Put had been sent by his master to purchase half a bushel of vysters, to the quay-but was absent so long, that apprehensions were entertained for his safety. He returned at last, however, even the most haughty wish to rise in her name. puffing under his load in the most musical style. "Where the deuce have you been?" exclaimed his master. "Where have I been? why where would I be but to fetch the oysters !"-" And what in the name of St. Patrick kept you so long ?"-"Long! by my sout I think I've been they are not in opposition to the laws of God, or pretty quick, considering all things?"—"Consider of his country, pering what things?"—"Why, considering the An action by which we gain an enemy and lose gutting of the fish, to be sure."—"Gutting, what a friend, is a losing game; because vengeance is fish?"-" What fish? why, bluid-an-owns, the a much stronger principle than gratitude.

oysters to be sure !"__" What do you mean ?"_ "What do I mane? why, I mane, that as I was a resting myself down forenent the Pickled Her-merciful to himself too late. ring, and having a drop to comfort me, a jontleman axed me, what I'd got in the eack? Oyaters, says I ;- 'Let's look at them,' says he; and he opens the bag. 'Och! thunder and praties, who sould you these?' It was Mick Carney says I, aboard the Powl Doodle smack. 'Mick Carney, ing terms:-Three-score years and ten, after birth, the thirf o' the world! what a blackguard he must be to give them to you without gutting.' And ar'nt they gutted? says I. 'Devil o' one o' them.' Musha, then, says I, what will I do? 'Do,' says he, 'I'd sooner do it for you myself than have you abused.' And so he takes them in doors and guta 'em nate and clane, as you'll see." Opening at the same time, his bag of oyster shells, which were as empty as the head that bere them to the house. If we had not this from an Irish paper, we should venture to doubt its authenticity.

Lord Kelly had a remarkable red face. One day Foote solicited him to look over his garden Beans, 126 varieties, including the English broad beans, Garden Burnet wall to ripen his melons.

How to pose a Professor .- "I say, Mr Clipps, understand you're a great bottomist." "Bottomist, Sir! I don't understand what you mean." Not know what I mean! why, they tell me you knows Brocoli, Early White all about things that grow at the bottom of the has been in the wrong; which is but saying, in sea, and such like, you know," "Oh! a botanist, you mean; well I do profess to be a bit of a botanist," "Well then, can you tell what this is?" "Why sir, that is what is called ____." I don't want to know what it's called-1 want to know what it is." "Well, sir, then it is a portion of the marine plant conferva."_". Then give me leave to tell you, Mr Cripps, it is no such thing; it is neither more nor less than a piece of sea-weed, for I plucked it up mysslf, on the sands yonder, not many minutes ago!" What more could be said? Mr we are old we perceive it is too late to live as we Cripps turned upon his heel with a "pshaw" and the querist went home to breakfast, and boasted how cleverly he had posed a professor. "I knew I should pose him!" said he ; " and I did it on purwith it, they say we are proud; if we are angry pose; for I like to take the shine out of those ere professors, as they call themselves!" He should have added, "Yet nature might have made me even as one of these, therefore I will not disdain." A Scene at Margate.

Ancient and Modern Maxims .- If there is any

The firmest friendships, are those formed in mu-An Irish paper gives the following anecdote of tual adversity; as iron becomes more compact in the forge, when the flame is most vivid.

Governors need no arms where there are laws, and they heed no laws where there are arms.

The subtlety of pride covers itself with the mantle of humility; so high is this virtue, that

The liber y of a people consists in being governed by laws made by themselves, under whatever form of government they may be.

The liberty of an tudividual consists in being owner of his own time and actions, so long as

He who does nothing charitable while living, and leaves his property to the poor when dead, is

Death has generally been called the debt of nature. A modern writer atyles it a debt on demand. Sometimes it is a debt at sight .- Nature may be supposed to draw upon every individual son and daughter of Adam, in nearly the followpay this my first bill of exchange, to that grim and inexorable tyrant, Death, with or without further advice.

Garden, Field, and Flower Seeds.

We have now for sale, at the office of the New England Farm We have now for sale, at the office of the New England Farm-or, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England,—mostly of the crops of 1827. The greatest care has been taken to have their raised by our most experienced seed-growers, and to have the sorts perfectly genuine. The following comprises our most prominent kinds:

The following comprises our most prominent and states, Green Globe date, Devonshire Gravesead Battersea Battersea United States and Green Turkey, &c., Legg Plant, Purple and White Cadive, Green & White curled Bataviao, for winter Artichoke, Green Globe Asparagus, Devonshire Gravesend dwarfs and pole. AGRICULTURE.

From Cobbett's Ride in France.

VINES IN FRANCE.

The neighbourhood of Tours is a great place for vines, and for the making of fine wine. I went along with my landlord to-day to see his vineyard, which is at about half a league from the city .-The vintage of the black grapes is not quite finished, here, and that of the white grapes is not begun. In this part of France they let the white grapes hang as long as possible, before they gather them, because, they say, it makes the wine stronger and of better flavour. The snow is, they tell me, sometimes upon the ground before the grapes are gathered. I saw a great many acres of vineyard to day. The vines look beautiful at this time, with all their leaves off, and loads of ripe grapes hanging upon them. The vines, which are planted in cuttings, or slips (just as gooseberries and currants are) of the last year's wood, begin to bear when about four or five years old .-An acre of vineyard, of the best sort of vines, in full bearing is worth, at Tours, about 3000 francs; or 1251. of our money. This year, they say, the vines will yield from 10 to 12 barrels of wine to the acre; barrels of 250 bottles each; or, as was before observed, of about 80 English wine gallons each. Good wine may be bought in Tours, by the single bottle, for 10 sous, or 5d. English, the bottle. The barrel, or piece, of this year's wine, will bring from 50 to 60 francs, at this place. But the wine of this year will not be of the best quality, on account of the grapes not having ripened quickly, which they should do to make very good wine. Some of the vines are very old; some of them forty, some fifty years old. The land round Tours is hilly ; uncommonly good strong land, and stoney, which is just the character of land to suit the vine. There is much rock in the hills here, as at Loches; and the wine-makers have caves. hewed out of the rocks, under the brows of the hills, in which to deposit the wine, and to carry on the process of making it. Some of the vines in this part of the country are cultivated in the espalier fashion. This is not, however, generally the case, where there is any considerable quantity of vineyard together. The common way is, to stick one stake, about four feet high, up to each vine. The stakes are pulled up, at this time of the year, when no longer wanted, and placed away in a stack, just as hop-poles are in England. The stakes are, as I said before, made of coppice wood, hazel, ash, and other kinds. They do not last above a couple of years; for, if used longer, they become rotten, and are easily broken by the wind. I was, when at Chateauroux, informed that, further to the South, the cultivators of the vine make use of stakes of Locust, which, they say, grow in coppices, and last a great number of years. The Locust is, in France, generally called Robinia; but in the vineyards the stakes of it are called, bois de fer; or, iron-wood; a name which the Locust very well deserves.

There is a kind of grape, which I saw on some vines here, made use of to give a colour to the red wine. When this grape is squeezed, the they very frequently became red-hot in using.

juice is of a fine dark colour, a mixture of purple and red. It is made use of in giving a colour to tough to bear bending, without breaking, he found all red wine, which could not have the fine colour it necessary to strengthen his punches, by surthat we see in it, but for the use of this sort of rounding and inclosing their stems in cast-iron grape. The vintage of the white grapes begins, holes, made of shapes corresponding with the this year, at about this time, the 7th of November.

From the American Farmer.

New and economical preparation of tar as a covering for houses.

MR. SKINNER, Sir, -- The recent scarcity,and consequent high price of tar, induces me to much as other kinds. In order to prove its fallacy, appeal to an experiment, the result of which I I last year planted a piece of fallow ground sixty submit to your judgment either to communicate to feet by ninety. I spread thereon eight wagons the various readers of your useful paper, or otherwise dispose of it as you may think proper .-Finding it a difficult matter to mix tar and red ochre, suitable, for the roofs of my houses, &c. I being about two feet apart; and at the season for could not make a mixture of those two articles, securing them, they were dug and carefully measthat would not, when cool, become separate. I was induced to make the application of a third sult of this undertaking has convinced me that it ingredient, viz: very strong brine, which has not is more to my profit to make my ground good in only removed the difficulty complained of above, the off-aet than in the usual way of skimming over but has enabled me to effect the object with six the surface; and, I am fully of opinion, the steady barrels of tar, which nine, in the ordinary way of demand for this article, and the advanced price in applying it to the roofs of houses, would not effect, market (should the yield be not equal to some othin the following manner. In the kettle in which ers) makes it much more to the interest of our I warmed (not boiled) the tar, I put half a barrel farmers to turn their attention more fully to their of tar. After placing a gentle fire around it, only sufficient to warm it entirely, I applied one gallon of brine, made as strong as salt would make it, to every two gallons of the tar; taking as much of the above described quantity of brine as was necessary to mix the red ochre to the consistency of gruel; then mixing the whole together, and stirring it till entirely united. This, I find, produces a better body than any other produce heretofore by the tar and ochre alone,-and when the advantages (of lessening the quantity of tar, the superior cement thus formed, together with the generally very desirable effect the salt will have to resist the ravages of fire, shall be placed in the scale of the additional expense of salt, which does not, I think, exceed a peck to each barrel of tar, (and that used by me was dirty fish salt) shall be tested by the experimentalist. I am induced to think, he will also recommend the plan to his fel-A VIRGINIAN. low citizens.

N. B. The above should be applied boiling hot.

On the use of chilled Cast-iron, for Punches, and other tools .- It is well known, that in making holes in red-hot iron articles, such for instance as wheel tire, horse-shoes, &c.; the hardened and tempered steel punches become softened, from the effect of the heat-and, changing their shape, must be repaired from time to time.

Mr. Peter Keir, engineer, of St. Pancras, seve ral years since, having occasion to make many nail-holes, in the wheel-tire of artillery carriages, and horse-shoes; and having experienced the above inconvenience in a great degree, luckily thought of substituting punches made of chilled cast iron, for those of steel, and which he found fully to answer the purpose, as they constantly retained their original hardness, notwithstanding

As, however, chilled cast-iron is not sufficiently stems, in properly shaped supports, and having their points only standing out a sufficient length for use.

KIDNEY POTATOES.

Mr Epiton-An opinion has long prevailed with our Farmers, that kidney potatoes do not yield as loads of coarse yard manuro and ploughed the ground (which was of a heavy loam) very deep .-On the first of July I planted my potatoes, the hills ured, and yielded me fifty-one bushels. The re-Yours, &c. A FARMER. cultivation.

N. Y. Farmer.

From the N. Y Evening Post.

BONE-SET.

Among the many proofs in favour of American plants for the cure of diseases, the Honey of Bone set, prepared at the . Yew York Infirmary for Bowel Complaints, No. 139 Grand street has been found most important. Its efficacy in the coughs and colds of this season, has excelled all other known remedies; it gives immediate relief to all those who have the asthma, and is used without danger of injury to persons of all ages and constitutions. Many children have been cured of the croup, (or hives,) whooping cough, and difficulty of breathing, for the sum of 50 cents; and several adults have used it to advantage in cases of cou sumption, where, if it ha snot caused a perfect cure it in all cases adds much to the ease and comfort of the patient. It quickly checks a severe fit of coughing, heals the soreness of the breast, promotes expectoration and allays the irritation that attends lung complaints, and in large doses it operates as an emetic. Those who do not wish to pay for the preparation and can take the nauseating draught of Bone-set tea, will derive good from the adoption of it, which can be had for little or no expense. One or two phials of the Honey of Bone-set, proves its valuable effects to all who G. G. V. No. 189 Grand-street. use it.

FLORIDA.

Judge Robinson, of Gadsden county, has succeeded after several years experiments in raising beantifal bright yellow Sugar, of a fine flavor. He expects a heavy crop next year. Several other planters intend embarking in the business.

FOR THE NEW ENGLAND FARMER.

SUGGESTIONS ON FISH PONDS, ANIMAL MANURES, &c.

MR FESSENDEN-There is one branch of farming or rural economy, which has been considerably practised in England, which I think could be profitably attended to in Massachusetts. I refer to fish ponds. You some time since published an abstract of some particulars detailed in the Transactions of the Royal Society ;* and also mentioned that the Cusk, a sea-water fish had been naturalized in the waters of Winipiscogee Lake. 1 think the project of rearing salt water fish, in fresh water ponds, has been proved to be practicable in Europe, and that it deserves more attention in this country. There are very many fine ponds that would answer this purpose in Essex and Middlesex counties, and particularly Long Pond in Worcester. I even think the subject worthy the notice of our Legislature; they annually pay some attention to the regulation of "Shad and Alewives."

This subject appears to me worthy the consideration of farmers even as a means of producing animal manures. There is a fine article on page 310, vol. iii. of the New England Farmer, on this subject, by Mr Briggs, of Bristol, R. I. to which I would refer your readers. Mr Briggs details the manner of using them, and the great advantages that accrue to grass lands by the application of this manure. And the subject is one of importance certainly, as furnishing an article of food, unfailing and wholesome-as another means of supplying our interior markets-of feeding cattle, late it by means of peculiar organs. It is therehogs, &c .- and improving and increasing the resources of the state. I have recently looked over the five volumes of the New England Farmer, some of the County Agricultural Surveys of England, Hunter's Georgical Essays, and several other Agricultural works, all of which seem to confirm the importance of the subject. Those of your readers who wish to examine the subject further, are referred to the New England Farmer, vol. ii. page 205-vol. iii. pages 221, 310, 339, 365, 403 -vol. iv. page 371-vol. v. page 176. I think it would be well for our Massachusetts Agricultural Societies to imitate that of Rhode Island, and offer premiums for Fresh Water Ponds well stocked with particular kinds of Fish for the purposes of the table, the arts, manufactures, &c.

Yours, &c.

From the Delaware Weekly Advertiser.

A paper read before the Delaware Academy of Natural Science. December 1, 1827.

The impoverished condition of a large portion of land in this State, and the consequent decline of wealth and population in some parts of it, calls agriculture depends, may safely be inferred.

It is therefore quite consistent with the spirit of this institution, which proposes inquiry into Sciseems to call for a series of plans for improve-

ment, founded upon inquiries into the causes which have led to the deterioration of the soil-a of man, it is on the earth chiefly that his influence more perfect developement of the process of veg. may be exerted. The modification of the soil, by etation, and details of the various improvements an alteration of its constituents or texture-by adopted by our neighbors in their mode of culti- the application of manure-and by a suitable sucvation. In the hope that some member more competent to the task, and enjoying more leisure than I now do, will turn their attention to the subject, I have sketched out some rough outlines and crude remarks connected with it.

The Sciences most important to man are those connected with his nourishment .- Agriculture, therefore, is to him a subject of primary interest. The successful application of it depends on a knowledge, the fundamental principles of which the quantity of rain, and the different plants inare derived from Chemistry, and form a branch of tended to be raised,-their productiveness is also that Science and is called Agricultural Chemis- influenced by the sub-soil on which they rest .-try; this has for its object all the changes con- When soils rest immediately upon a bed of rock, nected with the growth and nourishment of Plants they become dry by evaporation, sooner than which lands are rendered fertile by different will sometimes be of an advantage to a sandy soil. modes of cultivation, by the application of manure, by retaining moisture, and a sandy or gravelly subor a change in the constituents or texture of the soil often correct too great a degree of absorbent soil. Enquiries of such a nature cannot but be in- power in the true soil. teresting; to the farmer they supply the principles on which the theory of his art depends, and ticular item is the cause of unproductiveness in a an ample and interesting field for labor, and to tions will in most cases, indicate the most proper all, they present innumerable and pleasing proofs method of improvement. of the wisdom and goodness of the Creator.

and the modifications they undergo, that the scientific principles of agricultural chemistry are ob-

If plants be submitted to chemical analysis, it is found, notwithstanding their infinite diversity, that they are chiefly formed of three elements, Oxygen, Hydrogen and Carbon. These, with all other substances found in plants, are derived from the sap which is extracted from fluids in the soil, ontly productive, and requires less manure. and altered by, or combined with, principles derived from the atmosphere. It follows, therefore. that the superstratum of the earth, the atmosphere and water deposited from it, afford all the principles concerned in vegetation.

That a particular mixture of the various earths in the soil is connected with fertility, cannot be doubted: yet as the earths which generally abound in soils, viz: Clay, Sand, Lime, and Mag-CHEMISTRY APPLIED TO AGRICULTURE. nesia, are only found in plants in exceeding small portions, we must believe their chief use is to support the plant, and to enable it to fix its roots, that through its tubes it may derive nourishment from substances mixed with the earths.

That water is essential to vegetation, is fully esfor the attention of the citizens at large, as the tablished, as its elements exist in all the products intereats of every individual are in a degree con- of vegetation, and it is known that no manure can nected with the welfare of the whole community. be taken up by the roots of plants unless water is That this state of things is in a measure owing to present. The elements of atmospheric air also ignorance of the scientific principles upon which enter into the composition of plants, it being in scems an essential ingredient in most fertile soils. part decomposed by them.

Some persons have maintained that water alone ence for mutual edification, and the public good, their experiments & deductions have been shown that the labors of its members ahould be directed to be erroneous, and it is more generally believed mild state:—hence its extensive use in the prepto the devising of a remedy for this evil, which that neither water, nor air, nor earth, supplies the aration of wheat crops. whole food of plants, but that all operate in the process of vegetation.

Air and water being almost beyond the control cession of crops, are placed within his reach :and to these his attention must be given.

1st. Of the Constituent parts of Soils .- The substances which constitute soils are, viz: clay, sand, lime, and magnesia: oxides of iron and magnesia, animal and vegetable matters-saline acids and alkaline combination; no definite mixture of which can be pointed out as a standard of fertility, which must vary with the climate, and be influenced by the constitution of soils-and the manner in where the sub-soil is of clay. A clayey sub-soil

The most simple mode of ascertaining what parare useful in directing his labors to a sure plan of sterile soil, is to compare it with fertile soil in a improvement. To the man of Science they afford similar situation. The difference of the composi-

If, for instance, it is found to contain the salts Plants hold a middle place between inorganic of iron, or any sour matter, it may be improved by matter and animated beings. They receive their the application of lime. If there be an excess of nourishment from external elements, and assimi- limestone in the soil, it may be improved by the application of sand or clay. Soils too abundant forc by an examination of their component parts in sand, may be improved by the application of clay-a deficiency of vegetable or animal matter must be supplied by manure-an excess of vegetable matter requires the application of earthy materials; and marsh lands must be drained, as stagnant water is injurious to all the nutritive classes of plants. The labor of improving the texture and constitution of the soil is repaid by great advantages. The land is rendered perman-

2d. Of Manures .- The chief operation of manures is to supply food for the nourishment of plants, thus accelerating vegetation, and increasing the products of crops. Some, however, have a two-fold operation, and others are supposed to act as stimulants.

Gypsum, Plaister, or Sulphate of Lime .- Great difference of opinion has prevailed with regard to this article. The comparative small quantity used indicates a mode of operation different from othther manures-recently, however, the matter has been explained-It appears that Gypsum is a constituent part of most artificial grasses, of clover, and of the soil producing these crops; when therefore, landa cease to produce good crops of artificial grass, indicating an exhaustion of gypsum, they may be restored by the use of this manurc.

Lime, in its natural state, acts merely by forming an useful earthy ingredient in the soil; and it When burnt, and recently slacked, it acts by decomposing inert vegetable matter, thus rendering was sufficient for the nourishment of plants, but it proper food for plants absorbing at the same time earbonic acid, which restores it to its former

It may be advantageously used in bringing into a state of cultivation all soils abounding in hard

^{*} See page 34 of the current volume of the N. E. Farmer.

roots, dry fibres or inert vegetable matter, and of palace or temple. These walls, however, are with agreeableness, and greatly augment the value all soils which do not effervesce with acids will be denefited by it. It should not, however, be applied with vegetable or animal manures.

INDIAN CORN.

The Indian corp, now a staple production of New England was very early known to the pilgrim planters. We learn from Morton, that on till the water becomes cold. The quantity of wathe 16th of November, 1620, a company sent out ter should be at least double the quantity of corn from the first ship to look for a place of habitation to be purified. landed on the Plymouth coast, and "having marched about six miles by the sea side, espied five Indians, who ran away from them, and they followed them all that day sundry miles, but could not come to speak with them: so night coming on, they betook themselves to their rendezvous, and set out their sentinels, and rested in quiet Stout's creek,) " and the next morning they followed the Indian's tracks, but could not find them nor their dwellings, but at length lighted on a they saw sundry of their graves; and proceeding found where lately an house had been, where some planks and a great kettle was remaining, and heaps of sand newly paddled with their hands, ears, fair and good, of divers colors, which seemed to them a very goodly sight having seen bonc before; of which varieties they took some to car ry to their friends on shipboard, like as the Israelites spies brought from Eshcol some of the good fruits of the land; but finding little that might nic Garden, near Brooklyn, two miles from this water, either by hand or by a mill adapted to that make 'or their encouragement as to situation, city. His own garden, for which he made so ad- purpose. The pulp which is thereby formed in they returned, being gladly received by the rest of their company." On a second expedition soon after, core and beans of different colours were found .- . And here is to be noted a great and special mercy to this people, that here they got irregularity of the ground, and affording to visit. adhering to the pulp. The last process is to put them corn the next year, or otherwise they might ers a continual change of scenery, which is not it with a large quantity of water (about four galhave starved, for they had none, or any likelihond enjoyed in g rdens laid out in even surfaces, and lone to a pound of starch) through a fine gauze to get any until the season had been passed, nei. in right lines. His dwelling and French saloon muslin or lawn, so as to entirely free it from all ther is it likely that they had had this, if the first are in accordance with the surrounding rural as- bran or other impurities; as soon as it settles discovery had not been made, for the ground was pect. In his gardens are 25,000 vines planted pour off the water; then mix it up with clean wanow all covered with snow, and hard frozen; but and arranged in the manner of the vineyards of ter, repeating this operation till it no longer imthe Lord is never wanting unto those that are his. France. in the greatest need. Let HIS hely name have all the praise .- Davis's Morton 40.

Observations on the Medicinal Efficacy of WHITE MUSTARD SEED.

Written by a gentleman in Lincolnshire-from his personal experience-and originally circulated by him for the general benefit.

"In the month of June, 1822, I first made trial of the White Mustard Seed, merely as an aperient; when the generally improved state of my feelings, which immediately followed, inclining me to give it credit for other medicinal properties of at least equal value, I gave it to some of the sick poor in the neighborhood, with a success that excited my astonishment .- From that time to the present I have been in the habit of recommending it very generally, and the opinion which I have always entertained is now fully confirmed, that the public are not aware of its very extraordinary powers, nor of the very great variety of cases to which it is applicable; and that in order to its general adoption as a remedy for disease, its virtues require only to be known, to be adequately appreciated.

The White Mustard Seed is an almost certain remedy for all complaints connected with disordered functions of the stomach, liver and bowels, and has been eminently successful in the following cases :- In tendency of blood to the head, headache, weakness of the eyes and voice, and hoarseness; in Asthma, shortness of breath, wheezing, cough, and other distressing affections of the chest : In Indigestion, oppression after eating, heartburn, sickness, wind and spasms, cramp, and other uneasy affections of the stomach; in debility, uneasiness, pain and sense of tenderness and soreness in the interior, and particularly at the pit of the stomach, and in pain in the sides, and the lower part of the body; in all complaints arising from bile, scirrhous liver, and other morbid affections of that organ; in deficient perspiration, gravel, scanty and unhealthy state of the urine, and other disorders of the skin and kidneys; in relaxed and irritable bowels, flatulence, and occasional, or habitual costiveness; in severe colds, rheumatism, lumbago, spasms and cramp in the body or limbs, partial and general dropsy, palsy, coldness of the limbs and feet; and in loss of appetite, failure of sleep, weakness of nerves, depression of spirits, and general debility of the system. In Ague, Gout, Rheumatic Fever, Epilepsy, Scrofula, Scurvy, Piles, Erysipelas or St. Anthony's Fire, in the dreadfully painful affection called the Small Pox, Typhus and Scarlet Fevera, and other severe disorders, it has likewise been taken with very considerable advantage. For the long round worms, as well as the small white ones, it is also incomparably the best remedy, inasmuch as both in children and grown up persons, it not only destroys those reptiles, but if persevered in long enough to restore the tone of the stomach and bowels, will entirely prevent the recurrence in future.

The following case furnishes a striking proof of the extraordinary remedial power of the Mustard Seed. A very respectable Surgeon and Apothecary, whom I have long known, a person of regular and rather abatemious habits, who, during a period of thirty years, had sustained the fatigue of a most extensive country practice, with scarcely a day's illness, at the age of fifty-two was suddenly attacked with a severe pain in the left side and lower part of the body. Supposing the dis-

in the arm, used a hot bath, was blistered in the part afflicted, and lay for seventy hours in a most profuse perspiration. By this treatment the pain gradually abated; leaving him, however, at the end of four days extremely weak and emaciated. For the space of two years afterwards he had frequent and severe returns of the pain; and his constitution being undermined, the stomach, liver, and kidneys became sensibly affected; and indigestion, constipation and flatulence, were succeeded by every appearance of general decay. Having consulted several professional men, and taken a great variety of medicines during the period, but to no good purpose, in November, 1822, he made trial of the Mustard Seed; and it is remarkable that in a very few days after taking this remedy the pain entirely ceased, and has never since returned. The action of the affected organs was proving those secretions of the stomach, pancreas, gradually improved, digestion was restored, the and liver, by which digestion and chylification, times he was relieved by the discharge of several omy, are effected. It has very frequently succeedsmall portions of gravel. Encouraged by these advantages, he continued the use of the Seed loses its effect by use; it requires neither confinewith increased confidence. In November, 1823, ment to the house, nor any particular attention to he discharged with ease a large rugged oblong dict; and, in the absence of decidedly inflammatoportion of gravel: and, to use his own expression, ry symptoms, is always safe. In order to take it his health had then, and some time before, attained a state of wonderful improvement.

The White Mustard Seed is also fully as valuamine had for five or six years previous to 1823, in the use of the medicine consists. been regularly attacked with the hay or summer Asthma, in the months of June or July, in each of these years. The attacks were always violent, and for the most part accompanied with some danger; and such was the impressions made on his constitution by the disease, and the remedies resorted to,-of which bleeding and blistering were the chief .- that each illness led to a long confinement to the house, extending to a period of nearly three months. In the early part of 1823, he reuntil he is now enjoying a greater degree of strength and activity, and much better spirits, than he recollects ever to have had before. The most formidable bodily evils to which we are exposed, are well known to originate in colds, to viating the beneficial effects of sudden exposure. the Mustard Seed has in most instances been rewith the slightest cold, and have enjoyed an interrupted flow of health. A near relation of mine. whose life for many years had been frequently

course to calomel, rhubarb, castor oil, and sev- happily experienced a similar advantage from it; eral other active aperients, without obtaining re- and if persons of consumptive and delicate habits lief. He then took an emetic, was bled largely or otherwise constitutionally susceptible of cold. would avail themselves of this hint, and if all persons indiscriminately on the first attack of disease, would have recourse to the Mustard Seed for a few weeks, the extent to which human suffering might be thus prevented, would, it may reasonably be presumed, exceed all calculation.

In the White Mustard Seed are combined a valuable aperient and an equally valuable tonic; and thus, while it affords the most salutary and comfortable relief to the bowels, it never weakens, but on the contrary always strengthens, in a very remarkable degree, both those organs and the stomach, and ultimately the whole system. Its efficacy probably consists in a communication of energy and activity to those movements of the canal by which the aliment is propelled, and in this way perhaps it operates in animating and imbowels resumed their functions, and at different those most important functions in the animal econed when all other medicines have failed; it never with advantage, the patient need only attend to its effects on the bowels, which, generally speaking, it is not designed to purge, but merely to ble for the prevention as for the cure of disease; maintain in an uniformly open and comfortable and of its power as a preventive, the following state; and in securing this effect, of which any case is a remarkable illustration. A friend of one may easily judge for himself, the whole art

After what has been already stated, it is almost superfluous to observe that the Mustard Seed is peculiarly adapted to the case of those, whose habits, situations, and conditions in life, render them more particularly liable to disordered functions of the stomach, liver and bowels; with the endless variety of distressing maladies flowing from those causes. Of this class are principally the studious and sedentary; persons whose constitutions have suffered from long residence in hot solved to make trial of the Mustard Seed, in or climates; Mariners and Sailors while at sea: der to prevent, if possible, a recurrence of the Manufacturers and Mechanics of every description: complaint, and has since regularly taken a des- Miners and such as work under ground; the indosert spoonful about an hour after dinner, daily, to lent and intemperate: the poor who suffer from the present time; during which long period he hard labor and scanty means of support, and perhas not only wholly escaped the disease, but his sons advanced in years. To children also in the health has never been interrupted by illness of early period of infancy, the White Mustard Seed any kind, and has been progressively improving, is highly beneficial not only as a remedy for worms but as a means of obviating the extreme debility of the stomach and bowels so frequently attached to their tender years.

The Mustard Seed is always to be swallowed whole, not broken nor masticated; and either awhich, from the extreme variableness of our cli-lone, or in a little water, or other liquid, warm or mate, we are peculiarly liable. As a means of cold; and the best general rules for taking it are preventing this fruitful source of disease, by ob- the following:-Generally speaking, three doses should be taken every day without intermission; the first about an hour before breakfast, the secmarkably successful. Ever since 1822, I have ond about an hour after dinner, and the third eimyself regularly taken it once every day; and ther at bed time or an hour before; those who dine during all this time I bave never been troubled so late as six or seven o'clock, taking the second dose at two or three o'clock in the afternoon, and the third about an hour after dinner. Each dose should contain that quantity, which in the whole, exposed to imminent danger from inflammatory shall be found sufficient to produce a healthy evacaffections of the chest, brought on by cold, of vation of the bowels every day. Two or three ease to arise from constipated bowels, he had re- which he was remarkably susceptible, has also large tea-spoonsful in each dose will generally.

produce this effect, though with some constitutions much smaller doses will answer the purpose; but should that quantity fail, each dose may be increased to a table-spoonful; and in some instances a fourth table-spoonful may safely be added between breakfast and dinner. When this quantity fails to produce the desired effect on the bowels,-a circumstance which very rarely occurs,it will be proper to assist the operation of the seed with a little Epsom salts, or other mild aperient, taken every morning, or second or third morning, as occasion may require, instead of the first dose of the seed, for the space of ten days or a fortnight, or such longer period as may be found necessary. And if the patient be troubled with piles, it will be advisable to relieve the bowels occasionally with a small tea-spoonful of milk of sulphur, and an equal quantity of magnesia mixed together in a little milk or water, taken at bed time, either with or after the dose of the seed.

In Palsy, Asthma, Ague, diseases of the liver, Rheumatism, and Worms, the seed should be taken somewhat more freely than in other cases. and in instances of long standing and great obstinacy, to the extent of four or five large tablespoonsful in the course of each day, if the bowels will bear that quantity without much inconvenience; and in these as in other cases the patient must have recourse to Epsom salts, or any other mild aperient, or to the mixture of sulphur and magnesia, if necessary. When the seed is taken as a preventive by persons of consumptive and delicate habits, or otherwise constitutionally susceptible of cold, or by others for the purpose of preventing the recurrence of disease of any kind, or as a remedy for costiveness or any slight attack of disease, a single dose taken every day about an hour before breakfast, or, which is generally to be preferred, about an hour after dinner, will very frequently accomplish the proposed object, provided it be sufficient in quantity to keep the bowels in an uniformly open and comfortable state.

I will close these observations by remarking, that a steady daily perseverance in the use of the Mustard Seed, according to the rules above recommended, for the space of two, three, or four months, and in many instances for a much shorter period, will seldom fail to convince the patient of the extraordinary efficacy and singular value of this very safe, cheap, and simple medicine.

Early Vegetation .- Mons. A. Parmentier has at his Horticultural Garden, Brooklyn, beautiful asparagus, which he intends to serve up at the dinner to be given to-morrow at the Masonic Hall, in honor of St. John's Day. This is a vegetable extremely rare at this season of the year, and perhaps the first time it was ever seen so early at New York .- N. Y. Enquirer, Dec. 27.

The Pennsylvania Legislature have instructed their Delegation in Congress to use their influence in favour of an increase of duties on woollen and fine cotton goods, hemp, iron, glass, paper, and spirits. But eight voted against the instructions.

Anthracite Coal from Poughheepsie .- We have been informed (says the New York Journal of Miscellaneous Pieces, Commerce) that at the last meeting of the Lyceum of Natural History, Professor Barnes presented

the specimens presented were accompanied and united with anthracite coal. The coal was dissemor portion of shale, clay slate, in small granular time occupied in its composition was perhaps 24 a piece of argillaceous schistus containing py-

It fares with religion as with a shuttlecock, which is stricken from one to another, and rests with none. The rich apprehend it to have been designed for the poor; and the poor, in their turn. think it calculated chiefly for the rich .- An old acquaintance of mine, who omitted no opportunity of doing good, discoursed with the barber who shaved him, on his manner of spending the sabbath, (which was not quite as it should be,) and the necessity of his having more religion than he seemed at present possessed of .- The barber proceeding in his work of lathering, replied, "that ton (Con.) paper that the return cargoes of Sealhe had tolerably well for a barber; as in his skins of vessels belonging to that port and which apprehension, one-third of the religion necessary to save a gentleman would do to save a barber. Bishop Horne.

The editor of the Stonington (Conn.) Telegraph has undertaken to persuade his readers to use Lehigh and Schuylkill coal, in their shops, parlours, &c. not only as being cheaper than wood, but that the demand which necessarily exists for wood, may be hereafter supplied. It is a fact, that the prodigal axes of our fathers, and their capscious and all devouring fire-places, have left us little to boast of in the forest way, and our friends at the eastward will find their future prospects brightened, and their present situation rendered comfortable, by a free use of anthracite, which, by a very simple and exceedingly cheap contrivance, may be burned in a common tin plate stove, with as much convenience for culinary purposes, as hickory or white oak .- U. S. Gazette.

Value of Poetry .- Poetry is a most upprofitable drug, at least in the American market. Lord Byron did not find it so, however, as will he seen by the following statement:

Sums paid to Lord Byron, by the bookseller, Murray, as the price of the manuscripts of his

	works-

mineralogists who were present had no doubt that their respective merits. If Mazeppa be worth \$2,500, Manfred is surely worth \$8,000. It would be a curious task to calculate how much his lordinated through quartz, and attached to the surface ship received for each word in Mazeppa. The masses. One of the accompanying specimens was hours, (not all at one sitting). An industrious poct, paid at this rate, would soon have six Pegasuses to his barouche .- N. Y. Morn. Courier.

> Mrs. Sarah J. Hale the author of " Northwood,' is about publishing a monthly periodical, in Boston, to be entitled Ladies' Magazine. Such a work must receive an extensive patronage from the intelligent fadies of the U. States. We may anticipate in it much that will have a tendency to elevate the female character, and give to our ladies an intellectual rather than a merely fashionable taste. R. 1. American.

> It appears by a statement in the last Stoning have been sold by auction in that place since 1819, amounts to \$310,747.

> To preserve frozen Potatoes .- When potatoes are frozen, soak them for 3 hours in cold water, before cooking them. If they are frozen very hard dissolve a quarter of an ounce of saltpetre to every peck, and add it to the water. Frozen potatoes will yield more flour for starch than fresh ones. That flour with as much wheat-flour, some butter, sugar, yeast, and currents, will make excellent 'tea bread,' which will keep a month. Hartford Times.

> > From late English Papers.

We understand that the Chinese Tallow Tree, or Sedum Fecoides of Linnaus, has been introduced into the Mauritius, and cultivated with the greatest success. Two hundred barrels are daily expected as a sample, and the quality is said to be equal to any melted from the fat of animals. The quantity may be produced to any extent; and we believe, is likely to supersede the trade with St. Petersburg, for that article altogether.

It appears by an authentic estimate made recently in London, that no fewer than fifteen thousand boys, between the ages of eight and fifteen, live by theft, in that capital.

The Countess of Morton has presented to the Royal Society a variety of models, formerly the property of Smeaton the engineer, together with several drawings and plans of the Eddystone.-Among the other curiosities accompanying this donation, is the mass of lead which was taken from the stomach of the poor man who swallowed it in a fluid state, during the conflagration of the wooden structure which preceded Smeaton's farfamed light-house. This man lived for some time but died in consequence of the accident in Exeter Infirmary, when the production of the lead convinced his medical attendants that his story was correct, of which they were till then sceptical. Caledonian Mercury.

Another Gigantic Hydrangea .- We lately mentioned that a gigantic hydrangea was growing in \$74,220 the Earl of Roslin's garden at Dysart House, This is a pretty little fortune to make by poe- which measured 40 feet in circumference, and on some specimens of authracite coal, said to have try, and a very great incitement to scribbling -- which there were 605 flowers. A gentleman bebeen obtained in the slate rock near Poughkeepsie. The estimated value of the poems appears to longing to this city was in South Wales on the Professor Terrey, Major Delafield, and other have been determined without any reference to 8th instant, and in the garden at Amroth Castle, he was equally astonished and delighted with the land which are now waste, would have been rebeautiful and majestic appearance of one of these plants. On examination it was found to measure 331 feet in circumference, and on it were found the astonishing number of 832 handsome flowers. There is every probability that this is by far the greatest number of flowers ever seen in this country, on any of these splendid plants grown in the any state." open air .- Scotsman.

"Why are you so melancholy," said the Duke of Marlborough, to a soldier after the battle of Blenheim. "I am thinking," replied the man, "how much human blood I have this day shed for sixpence!"

We are informed there were, a few days since, 22 vessels taking in and unloading Rough Rice for the London and Liverpool Markets, in Ashley River, near the Charleston Bridge.

Remarkable Hybrid .- There is at present, at Berlin, an animal produced between a stag and a mare. The appearance of the creature is very singular-the fore part is that of a horse, and the hinder part, that of a stag; but all the feet are like those of the latter animal. The king has purchased the Hybrid, and sent it to the Pfaneninsel, at Potsdam, where there is a menageric.

An action was brought in the Court of Common Pleas, (London) by a person who had been injured by a mischievous ball, against the owner of it. A verdict was found for the plaintiff ;- Damages

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JAN. 4, 1828.

The subjects suggested by F. H. P. not muiced in his in much higher estimation. communication in this week's paper, will be attended to as occasion may offer.

WASTE LANDS SUBDUED.

It appears by certain statements, and calcula-Review, that in Great Britain, "since the commencetillage; and, that no less than eleven parts in twelve were inclosed in one reign, that of George Ill., the steady and constant patron of agriculture.

"Notwithstanding these praiseworthy exertions, it is estimated that England alone, still contains reservoirs are continually running over, and of sufficiently compact to hold water, the bottom about six millions of acres of waste land, yielding but little produce; and that, including Scotland and Ireland, the quantity of waste land in this ways, ditches, and rivers. kingdom cannot fall short of thirty millions of acres. How much of this may be incurably bar. lost in this manner, (for parts of the salts, whether structed on a sand loam, resting on a clay subsoil. there is every ground to believe that a very large proportion of it is capable of being rendered highly productive, under a skilful and energetic system of tillage. Upwards of two hundred years has almost exclusively directed its attention to the cultivation of its foreign possessions, leaving the improvement of its territory at home to the exertions of individuals. It is not too much to say, that this country has expended upon the culnot fall short of fifty millions; and upon wars arisno rational man can doubt that extensive tracts of manured.

claimed, and that an incalculable addition would carts, and one horse, may manure a great deal of have been made to the produce and population of land in a day, provided it be near the yard, I the country. "Industry," says Harte, in his ad- would recommend the practice to all farmers; for mirable essay, "is the vis matrix of husbandry, and the expense is nothing but the value of the time an ancient English writer well observes, that a of the boy and horse, and the increase, by what I single uncultivated acre is a real physical evil in have seen, will be very great.

culate, as near as possible, the quantity of waste or any other grain; but on grass it should be laid land in the older and more populous parts of the in the spring, when the lands are laid up for hay, United States; and also to form some estimate of as the cattle will not feed on grass, while the the quality of such land, and what it is capable of dung or its essence or salts adheres to the herbproducing when reclaimed and well cultivated. A age. great part, and perhaps the greater part of the This dung water should likewise be carried on drained, subdued, and judiciously tilled, is much may be manured from time to time, and the pools the first attention and monopoli, ed the first efforts be lost .- English Publication. of our first settlers. It is hardly too much to say, that the best lands in Massachusetts, (on an average) are still in a state of nature; and although it would require much labor and expense to subdue them, their superior value when subdued would amply compensate for their subjugation.

Another kind of waste lands, of which there are great quantities in all parts of the United States, are called pine-plain and shrub-oak lands. These are reclaimed with less difficulty, and are very easily tilled, when once brought under the plough. These lands, with aid of gypsum, clover, turning. &c. may be made perhaps as profitable as the

LIQUID MANURE.

As a farmer, like a chemist, should lose none of his materials, but even make his washings, runtions, in the last number of the London Quarterly nings, and residuums turn out to his advantage. I may communicate to others.

> pounds a year, and have in my yard what you carried off by the necessary drains, into the high well beat down, and covered with gravel or sand.

ren, it is impossible to ascertain exactly :--hut fixed or volatile, will be washed into the pools, Here should be annually deposited as they can be and when they run over, will be conveyed into conveniently collected, the weeds, coarse grass, the ditches, &c.) I thought it good husbandry to and brakes of the farm; and also the pumpkin carry this superabundant water or manure, (for so vines and potato tops. The quantity of these upwe may justly call it) on my land, which I did by on a farm is very great, and are collected and have now chapsed since the British government means of a watering cart, not unlike those with brought to the yard with little trouble, by teams which the roads near Loudon are watered in the returning from the field. And here also should summer time to allay the dust.

As a man, or even a boy, with one of these

This manure may be also laid to great advan-It would be not only curious, but useful, to cal- tage on land, that is fresh sown with barley, oats,

waste lands in New England, consists of swamps, the land, not at a time when it rains, but in dry and land naturally too wet to produce any kind of weather, and at a time when the dung water in vegetation which is useful to man or domesticated the ool is of a deep brown color, and strongly animals. This land, however, in general, when impregnated with salts By this means, the land more valuable than the uplands, which being kept almost empty for the the reception of fresh cleared and cultivated with less labor, attracted matter whenever it rains, and thus nothing will

> In order to form a proper repository for that part of the farmer's liquid manure which consists of the washings of the farm yard, the yard itself should be situated and formed according to the following directions by Judge Bue , of Albany :

> "I will now suggest a cheap and practicable mole of providing food for vegetables, commensurate to the means of every farmer of ordinary enterprize; and that my suggestions may not be decined theoretical, I will add, that 'I practise

what I preach."

"The cattle yard should be located on the south side of, and adjoining the barn. Sheds, substanstronger and stiffer soils, which are generally held tial stone walls, or close board fences, should be erected, at least on the east and west sides, to shelter the cattle from cold winds and storms, the size proportioned to the stock to be kept in it .-Excavate the centre in a concave form, placing the earth removed upon the edges or lowest sides. have sent you some account of an experiment I leaving the borders ten or twelve feet broad, of a ment of the last century, upwards of six millions have made in manuring land which I beg you will horizontal level, to feed the stock upon, and from of acres of land have been brought into a state of lay before the committee of agriculture, that they two to five feet higher than the centre. This may be done with a plough and scraper, or shovel and I am possessed of a farm of near three hundred hand-barrow, after the ground is broken up with the plough. I used the former, and was employed usually see in farmers' yards, two recesses or a day and a half, with two hands and a team, in pools, as reservoirs of dung and water. These fitting two to my mind. When the soil is not course a part of the matter contained in them is should be bedded with six or eight inches of clay, This last labor is seldom required, except where As much of the essential quality of the dung is the ground is very porous. My yards are conbe fed out, or strewed as litter, the hay, stalks. That the experiment may be the more obvious and husks of Indian corn, pea and bean haulm, and certain, I first tried it in the beginning of the straw of grain not wanted in the stables. To March on a few acres, in the middle of a large still farther augment the mass, leached ashes and tivation of its foreign colonies, a sum which does field of wheat, where, in a little time, I found a swamp earth may be added to advantage. These considerable increase of growth, both of grass materials will absorb the liquid of the yard, and ing from its connexion with those colonies, no less and grain; and at hay time and harvest both the becoming incorporated with the excrementitions than two hundred millions. If a moiety of this one and the other were much better crops than matter, double or treble the ordinary mantity of sum had been expended upon our own territory, what the same lands produced that were not so manure. During the continuance of Coat the excavation gives no incorrectiones, 15 when the

weather is soft, the borders afford ample room for the cattle. In this way, the urine is saved, and the waste incident to rains, &c. is prevented .-The cattle should he kept constantly yarded in winter, except when let out to water, and the yard frequently replenished with dry litter. Upon this plan, from ten to twelve loads of unfermented manure may be obtained every spring for each animal, and if the stable manure is spread over the yard, the quality of the dung will be improved, and the quantity proportionably increased .-Any excess of liquid that may remain after the dung is removed in the spring, can be profitably applied to grass, grain, or garden crops. It is used extensively in Flanders, and in other parts of Europe."

It would be an important addition, to the above plan, if a pool, cistern, basin, well, or reservoir were formed in the centre of a yard constructed as above, and so located as to receive not only the wash of the yard, but the liquid manure from the stable. This should be sufficiently large to drain off and contain most of the superabundant moisture from the manure in the yard; which, if too wet, will give out unhealthy exhalations, besides being of less value as food for plants. The reservoir should have a movable top or cover with grating or small holes, which will admit the liquid but exclude the solid part of the manure; and the former should be pumped out or otherwise taken and applied as above directed. [See N. E. Farmer, Vol. V. page 161, 162.]

REMARKABLE VINE.

In Speechly's Treatise on the Vine there is given a drawing of a remarkable vine growing in Northallerton in Yorkshire, that once covered a space containing 137 square yards; and it is judged, that if it had been permitted, when in its greatest vigour, to extend itself, it might have covered three or four times that area. The circumference of the trunk, or stem, a little above the surface of the ground, is three feet eleven inches. It is supposton of grapes in a year.

Useful Hints relative to Carters and Teams of Oxen.

Do not retard the growth of your beasts of Publications. draft, endanger their health, and render them insignificant in the eyes of many by working them bard while too young. There is no danger of their becoming unmanageable; nose rings reclaim them, be they ever so vicious; nevertheless the younger they are innired to light work, the more they are innired to light work, the more divergence of the rine and the Management of the House. MISCELLANIES.

New Year's Address.

Time, the most persevering body
'Twixt New Orleans and Pass'maquoddy,
Who waits on beggars, treads on kings,
And makes and mars all earthly things;
Who forms a palace, or a shod—
A Newton's noll, a cabha e head
With equal ease—by whose assistance
All Being had and has existence—
The perpetrator of all crime,
(For every thing 's the work of Time,)
As well as source from whence proceeds
All noble and praise-worthy deeds;
In truth the causa sine qua non
Of all we have, hope for, complain on;
Another Year has brought to pass,
And turn'd the old Year out to grass.

And now, said all efficient wight, Bids us attempt our annual flight, O'er Heaven's high canopy to steer, And hail the Advent of the Year—Our hard-ship pronising to crown, And cap our climax of renown With amaianthine wreaths, more bright Than splendid filaments of light, Which Day's Ascending Regent pours Profusely from his golden stores, Tinting the clouds, by zephyr riven, With the most gorg-ous hues of heaven.

But, stop-I apprehend that we Have set out on too grand a key, And must come down from heights immense. To tread the ground of common sense; On earth a Farmer's business lies, Not sowing wild oats in the skies. Thus some Psalm-singers I have known To set the tune, but miss the tone, And then proceed, in Jehn-style, Above the key-note, half a mile: And driving onwards, thorough stitch To A in alt, at concert pitch :-Now minims, crotchets, quavers, dash Together with discordant crash ;-And even the Fair, now rend the Air, The music rare, to tatters tear ;-(Ladies, though fair as flowers in June, Will now and then get out of tune,) Stave thro' the staves, like folks possess'd, And murder one of Handel's best. Finding the Choir against a stump, The Leader, with commanding thump, Now puts a period to the strain, Gives a new pitch, and starts again. So, having slightly scath'd our pinions la Fancy's perilous deminions, We, ploughman-like, will plod along Through the dull remnant of our song.

Last year exhibited ahundance, Amounting almost to redundance, Of prime productions of the soil, To crowe the Cultivator's toil. Elessings have fall'n, like drops in showers, Health, Peace, and Plenty have been ours, And every earthly boon indeed, Which Heaven bestows, or mortals need -All that should lead us, on our parts, I thankful lips, and grateful hearts, Kind Providence, with lavish hand, Has scatter'd o'er a smiling land. Earth's products are of such a size, We scarcely can believe our eyes, And almost doubt the evidences Of all our congregated senses. For instance, Beets, the beat of all The heets produced since Adam's fall-Strawberries, which a man would guess Were large as Peaches, more or less, And Pears, approximating towards The ordinary size of Gourds;— So hig, that hotanists will say to us Their genus is cucurbitaceous Meaning, thereby, to tell us bumpkins Said Pears have cross'd their breed with Pumpkins Are, therefore, being thus allied. Sheer monsters on the mother's side.

And wry-neck'd Squashes, which were found To overload the solid ground, And threaten, by mere dint of gravity, To break the shell of Symmes's cavity.

Improvement's meliorating hand Shines like a sun-heam thro' the land. Here, docks and wharves, new streets and stores Emboss old Occan's smiling shores. Teeming with products of all nations-There factories rise like exhalations. Here, Toil his task Herculean plies, There Art bids new Creations rise, And HOME-SPUN WORLDS obey the will Of human industry and skill! These means subserve the Farmer's ends; Here dwell those ready-monied friends, Who raise the value of his lands And take that surplus off his hauds, Which otherwise were useless trash, And metamorphose it to cash: Just as one Midas, we are told. Turn'd every thing he touch'd to gold.

Did it not look like ostentation, And trumpeting self-approbation. We verily might say, with verity, We add our mite to this prosperity By fabricating head-work, which is Harder by half than digging ditches. And while we toil with lustihood For every individual's good. Hebdomadally lectures giving, To teach all men to get a living, We're wide awake to every movement; Which tends to national improvement. We therefore, may, we apprehend, Be christen'd Every-body's Friend; A wight who has the World at large Committed to his special charge, To oversee whate'er relates To incomes, outgoes, goods, estates, And tell their owners how they may Increase them in an honest way.

Our worship merits a position Along side some renown'd physician, Before whom all disorders vanish, And baffled death himself "walks Spanish;" But few disorder- can be worse Than quick consumption of the purse-Where squalid poverty prevails, The patient needs no other ails, Whate'er some moralists may deem, To make him wretched in th' extreme; For awful agonies await A mortally diseas'd estate. But we assail this sore disease With economic recipes, Or like the Coan -age verbose Prescribe full many a goodly dose Of "aphorisms," which rarely fail To cure the empty-pocket-ail.

There's likewise nothing truer than That we are Fredom's Right Hand Man; By Poverty, if paralysid, A Commonwealth is soon capsiz'd;—Suppose we Yankees were a set of paltry paupers, deep in doht, Dreading, for lack of wherewithal The wrong side of a prison-wall, Pray le 1 ns what we might regard?

The wight in straighten'd circumstances. Plagued and embarrass'd in finances Can hardly he much better than A pitified time serving man. And when the storms of Faction lower Succumbs to every blast of Power.

That spruce old gentleman, so smart, With "Fagle-ey." and "Lion-heart," Whom bards have demi-defied. Call'd Independence, wont abide With ignorant, idle, shiftless chaps, Poor living proots of Adam's lapse. He quaffs his cider, cracks his jokes With good, stout, hardy, thriving folks,

But his sojourning will be brief With those who can't get bread and beef.

To benefit our fellow men
We ply the press and push the pen.
For aye continually contriving
The ways and means to make them thrivingLest they become, as life advances,
The slaves of narrow circumstances,
A slavery little in arrears,
Of what men suffer in Algiers.

And sure 'twould seem no more than fair
That they who give should also share,
Of course your Honor will bestow
A trifle of the quid pro quo,
(Anglice) some remuneration
For all the useful information,
Drawn from the "Farmer's" ample stores,
We have presented at your doors.
And now, kind Sir, before we part
We wish you may, with all our heart,
Enjoy through this, and many a year
GOOD HEALTH, GOOD FRIENDS, GOOD LUCK, GOOD
Be bleet in basket and in store,
Till this life's transient scenes are o'er,
And in the next forevermore.

Boston, January 1, 1828.

Simple contrivance for a lamp.—The inhabitants of Landes, in the south of France, being completely cut off from the rest of the world, have it not in their power, (except when once or twice a year they travel to the nearest towns with their wool,) to purchase candles; and as they have no notion how these can be made, they substitute in their rooms a lamp fed with the turpentine extracted from the fir trees. The whole process is simple and primitive. To obtain this turpentine, they dut a hole in the tree, and fasten a dish in it to catch the sap as it oozes through, and as soon as the dish is filled, they put a wick of cotton into the midst of the liquor, and burn it as we do a lamp.

Such a contrivance might answer very well if placed in a chimney-way, or in some other thorough fare for smoke.

Large Hog.—Mr. Enoch James, (of Deerfield,) slaughtered a hog this season, eighteen months old, which weighed when dressed 716 pounds. Portsmouth Journal.

I look upon every man as a suicide from the moment he takes the dicebox desperately in his hand, and all that follows in his career from that fatal time is only sharpening the dagger before he strikes it to his heart.—Cumberland.

The Jews have a proverh, that he "who breeds not up his son to some occupation, makes him a thief,"—and the Arabians say, that an idle | erson is the devil's play fellow.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

HORSES.

Sta-There is no branch of rural economy more neglected in Massachusetts than horses. Why this should be the case I am ignorant; a colt can be bred nearly as cheaply as a steer; and is worth much more money when he is grown .--What a farmer can find to read upon this subject, if he desires it, must mislead him; most of it being taken from long exploded English treatises, and few men are to be found here, whose acquaintance with the subject is not exceedingly superficial, who are not of the less educated classes of the community. I have read an American Treatise, in which not only are the plates taken from an English one: but the auther gives his readers a chapter upon chest-founder; ascribing it to taking cold, &c.; a disease very well known at the present day to proceed from continual pain in the feet.

I wish to give you a few very short observations upon the most valuable breeds of horses; upon breeding them; the treatment of horses kept for their work ; and the management of foot lameness.

Nature originally formed to herself, there is reason to suppose, two separate models of horse. flesh; though the different breeds of horses derived from accidental varieties and mixtures may be infinite. One she meant for daily drudgery in a northern climate; the other for speed, for violent occasional exertion, to gratity the pride and form one of the relaxations of luxury, and to live in the tropicks. The two horses are still to be found distinct; but most horseflesh is made up of their mixture.

The first is indigenous in the North of Europe. The basis of his colour is almost invariably black: though in some few of his varieties, he is either roan, or gray with most of his dark hairs red .--He is seen in Massachusetts perfectly pure in the Canadian: who has his fringe of hair starting directly from the knee; his shortness of breath; his willingness to draw; his sensibility to heat; and all the other attributes of the unadulterated cart horse. The gray horse, sent here by General Coffin, is a specimen of his English variety; but not of the very largest size. The true Canacarry flesh, and exceedingly well suited to a it. changeable climate; but he is unfit for fast work; his outworking the common Massachusetts horse at slow.

A remarkable degree of misinformation exists here as to the second; and, it may be well to give a very short description of him. In the countries where he has always been found, at least since the first dawn of history, he is about fourteen hands and an inch high, but pretty compact; the basis of his colour scarcely ever black; but generally, even if he is gray, some kind of red. He has a

tail pointed straight to the end when he is in ac- three thousand dollars to his owners, in the vicintion; and has a round, high, and hard hoof. His lity of the city of New York, the last summer, as purity has always been most sedulously preserved a breeder; and that he will probably this sommer by the Asiatick Arabs. His bones are of a much carn much more. generally excessively hard, the internal foot possesses extreme sensibility. He does not appear, under favorable circumstances, upon being transported to the climate of the cart-horse, to experience any diminution of his superiority to him, through any number of generations; though he is useless as he approaches that of the Arabian.

His most valuable variety, and that with which we are best acquainted, is the English thoroughbred horse; by which term is intended a horse, all of whose blood is to be traced to acknowledg-Desert of Palmyra. The blood of these two horses runs in the veins of the multitude of thoroughbred horses annually foaled in England, on the Continent, and in the United States; and exceptdian is a valuable horse, has a foot endowed with ing the genuine cart horse, there is scarcely a very little sensibility, is very much inclined to horse in England or the States entirely free from

The peculiar advantages and disadvantages of and I question the fact from what I have seen, of the thorough-bred horse, who is most corruptly called in Virginia the blooded horse, for bloodhorse, are exceedingly necessary to be known to his being two years old; which gives to his hoof every breeder; as, though he is not so well adapt ed himself to any purpose but horse-racing, as a horse bred between him and one not thorough bred, he is proved by the experience of a century in England, to be the only foundation of any reasonable expectation of breeding superior horse- upon it; and crowds the circulation of the sensiflesh; allowed to be, and sought after from that ble foot, by preventing the increase of size of the cause by the Russians, the Germans and the vascular parts after the excessive concussion to remarkably expressive eye, and very transparent; French, who are all becoming great horse-breed, which the horse is daily subjected from that early his nose nearly straight, and the nostril disengag. ers, and in most parts of the States, excepting in age. Being also fed with the largest allowance

wide and elevated loss; carries the dock of his mention that Henry carned between two and

denser texture than that of the cart horse; his He (the thorough bred horse) is subject to infiskeleton is heavier in proportion to his apparent nite variety; but he is generally accompanied by size; and he can stand under a heavier weight, the following peculiarities. In wind, in muscular His most distinguishing characteristick, however, power, and patticularly in being able to perform is the natural clearness of his wind; and breeds feats, he far surpasses any other horse; even the of horses vary in this particular, according to the Arabian in his unimproved state. A case in point proportion they possess of his blood; or, as it is has occurred in which two Cossack horses, pick technically called, of "blood." This, with his ed from their immense stude, were beaten in a 30 muscular power, arises from the perfection of his mile race, over a hard road near St. Petersburg. organization; and he is often abused from the by a broken down English race horse, and he also idea that he possesses a peculiar insensibility to beats the best herses that can be bought in Arafatigue, which none can thoroughly explain. His bia, in their own climate at Calcutta. All his essence is speed. He is more inclined to save work is performed in much less time, when the himself by flight from any thing he does not thor- pace appears to the eye to be the same; he can oughly understand; and is more irritable and va- be used at an early age-he possesses greater riable in constitution. As he is probably indigen longevity—he suffers less from the heat, than a ous in the sands of Arabia only, there appears no low-bred horse, but there his advantages close .-reason why his foot should have been made able His ancestor was formed merely for gallopingto endure the concussion of a hard surface; and leaving all meaner business to the donkey and the in some of his varieties, though the horn of it is mule; which, in his ancestor's climate, are noble animals-and from this cause, as well as from the peculiar manner in which he has himself been bred and treated, he is attended by two great disadvantages. He has, in the first place, been bred from a succession of horses selected for their superior galloping from a race of gallopers.

Excellence in this pace, which is, however, nearly an accurate criterion of wind and muscular strength, is generally accompanied by a formation of the animal, inimical to excellence in any other; and a remarkable disinclination for exerted racers, or to a very few celebrated individual ing himself on any other than extraordinary occahorses, supposed to have been chiefly of Arabian sions. To assist him in economising his powers, blood, whose stock has in general proved so in and to render them entirely subservient to the ra-England. Some of the pedigrees of this Anglo- pidity of his progression, he is formed, frequently, Arabian have been regularly kept from the reign to move his feet so short a distance above the of James the first; but a very large part of him is earth, that, particularly in a slow walk, he is conderived from two individuals; one carried there tinually liable to have it meet with some obstrucabout ninety years since, whose previous history tion, when it is bent backwards from the fetlock. is utterly unknown; the other, about one hundred joint, and he is about to throw his weight upon it; and thirty years since, who was brought from the the muscles of the bended limb not being under his command, he must occasionally lose his bal. ance; and if it is his fore foot fall forwards; and. if it is his hind foot, eatch backwards; and, in confirmation of the last observation, many superior gallopers appear actually unable to use their muscles properly, when not in a state of violent exertion; have a slipping, thoughtless manner of going at all other times; and will not brace their muscles. In the second place, he has been in gereral confined in the stable, and shod previously to a totally different shape, in growing, by preventing its lateral extension; takes away much of the means of resisting concussion which nature intended it to have, by preventing the expansion of the back part of it, when his weight is thrown ed from the head; a most capacious chest; a New England. As a proof of this last fact, I can of corn from before he is weaned, and the hoof

ADDRESS.

ral, and third Social Library in Easton, Mass. December 18. By ROLAND HOWARD.

GENTLEMEN-I take it for granted that the severe concussion, a degree of pre-disposition most of you are already apprised of the object of this meeting-and if so, I beg that you will indulge me with a few moments of your attention, which, (as the human teeth) are remarkably ready and a reasonable share of your candour, while I to discover an hereditary mis-organization. The offer for your consideration some of the advantathorough-bred horse has been long naturalized in ges, which, in my apprehension, may be derived the States; forms, at least, half of the Massachu- from the establishment of a Social Library, selectsetts mongrel, and is found as common, and in as ed with judgment, and managed with discretion high perfection, as in England, in the low country and care; to be confined principally to subjects istence. which relate to rural pursuits and domestic econ-

Whatever might have been the original condiwhich the horse and mare sent here by Sir Isaac tion in which man was placed, of one thing at Coffin, were intended as a sample. The true least we are now certain; and that is, that the sustenance of man is only to be obtained by lathe county of York. Though a much finer horse, most proper to be employed to obtain wherewith and not over large, he bears a general resem. to satisfy our daily necessities; and thus we have day. blance to the German horse of the Middle States; not only our bread to procure, but we have to acparticularly, in his full crest, his Roman nose, and quire the necessary knowledge how it can be prohis deep bay color. He is in the very highest re- duced-nor is this condition, perhaps, much to be quest, both in England and on the Continent; and regretted, since so much of our happiness depends stands at the head of all breeds between the blood on the constant exertion of our physical and men-

It appears from history that the employment given by the Supreme Being to some of the first many of our ancesters having come from his The first man was a dresser of vines and a culticountry, and his peculiarities are often to be trac- vator of fruit trees; or in modern language he ed in our horse. Then it appears that as soon as men were created, an employment was assigned them, suited in all respects to their physical powers, and well as adapted to supply their daily wants. In process their gentlemen's hunter. He is often supposed of time men became multiplied, and it was found here to be the offspring of a direct cross between necessary that their employment should be still the blood-horse and the cart-horse. This has, in further varied, and adapted to all the necessities some instances, been the case; but he is usually, of a wide and extended population. Hence the now, either the thorough-bred horse himself, or origin of the Mechanic Arts-wide spread Commerce-and the complicated Machinery of the Manufacturer, which at this day give employment has been tried and found useful. in 4 could not be claimed by the Arabian. Some to millions of the human family, and incalculably horses, not thorough-bred or as they are called serve to ameliorate our condition, and increase

It is not my present design to go into detail ough-bred horse having the advantage of afford-upon all the different employments of men, but the remarks which I have made were designed to show that however varied the employments of to give some grounds for a calculation concerning men may be, they are each necessary to the presperity of the other; and that it is as necessary to times keet caire, and as tried good hunter must the prosperity of the body Politic, that all its members are in a sound vigorous state, as it is that each member of the human body should be healthy, and capable of performing the various functions to which they are respectively adapted servations Hence it is, that Agriculture and Manufartures live strength and support to Commerce; and Commerce in return, gives spring and support to Ag.

ed to exist among us, between men of different occupations, and which have a manifest tendency to mar our general and individual prosperity.

Therefore if we wish to be prosperous in our several occupations, let us learn to think liberally and act liberally towards these who may be differently employed, provided their occupation may be a lawful one.

You will now permit me to revert to the first employment of our race, viz. Horticulture, Agriculture, and the rearing of domestic animals; and here permit me to observe, that these employments were not only first in the order of time, but they were, and still are, the first in order to ex-

In vain would the whitened canvass spread upon the wide besem of the deep, if the hand of agricultural industry becomes palsied, and the earth should refuse to yield food for man and beast .-In vain would the wheels of our manufactories be put in motion, if the pleugh, the harrow, and hee, bor, and the sweat of the face; and that we are together with the other implements of husbandry. is extremely scarce in England, and confined to born into the world totally ignorant of the means are suffered to rust and decay, and the husbandman is found folding his arms in sleep at neon

> Therefore, as it is from our mother earth that our race is to be upheld, and that too by the skill and energy of the agriculturist, it is but a reasonable inference, that the husbandman should avail himself of all the knowledge attainable, which may be likely to be useful to his profession .--When I speak of the agriculturist, I wish to be understood to include horticulture, and the care of domestic animals,-for notwithstanding they may appear to have been three distinct callings originally, they are now generally blended together; and the farmer or agriculturist, has to rear his own trees, and his own acimals.

> 'Agriculture is universally admitted to be an art, and if an art, why does it not need the same auxiliary aid and support as every other art?-The navigator has his books, his maps and his charts, and by a thorough knowledge of his profession, he is able to bring his ship safely into port, amidst the howling of the wind, and the thunders of the storm.

The manufacturer searches every book with a scrutinizing eye, wherein is recorded one particle of knowledge relating to his business; and cheerfully puts in practice every new discovery which

Professional men also, universally consider books relating to their several professions as indispensably necessary-and why? It is because every material fact, they can there find recorded by those of the same profession, who have lived centuries before them; and thus they are able at one view to concentrate the experience and knowledge of all preceding ages.

Indeed, there is but one class of men with which I am acquainted that contemn and deride all experience and knowledge which relates to their calling, or profession, if shown to them in a book, no matter how many well authenticated facts may be recorded -- no matter when, or who made a useful discovery, or how heneficial its results : if the facts or the discourries are found in a book, they with them are stark naught.

Need I designate this class? or may I presume jealousies that have prevailed, and are still believ- all the arts, I will presume the latter, and proceed. been urged by those alluded to against the utility of books, as being promotive of their interest or happiness; and will engeaver to produce proof riously demand that something should be devised mon people are very civil and obliging, whenever positive, that such reasoning (if indeed it can be that will at once display to their view, an object I ask them any questions about what I do not my called reasoning) is both fallacious and rumous to all improvement.

If a farmer presumes to search the pages of any publication, which treats upon the subject of Agriculture, or domestic economy, he is sure to be stigmatized with the uncouth epithets " book farm-"gentleman farmer," "theoretical farmer" and the like ;-and by some, it is roundly asserted and that the knowledge acquired by individual experience and observation is the only knowledge to be relied on, or regarded. It is to be stated, hovever, that even such have been sometimes known to admit, that they have caught some new and useful idea from the Calendar page of the " New England Farmer's Almanack," which has accidentally met their eye when looking for the day of the week, or month; and, having been found in an Almanack, surely must be entitled to is indeed atrange and won lerful. some consideration-for the man who can make an Almanack, and foretell eclipses, and the full and change of the moon, must, to say the least, be endowed with an uncommon degree of wisdom and foresight; and consequently the hints, or facts recorded in the Almanack are entitled to a much greater degree of confidence and respect, toan the same or similar facts morit if found recorded in any other book.

ought to have the preference? and which would perience of past ages with our own. be the least liable to abuse? I venture to say there are none Nor do I believe there are any, derived in practical life, by consulting the oracles of past experience.

The object of this association is the improvement of its members in useful and practical knowledge, and to aid in diffusing it generally through the community.

to be owned in common by those who may see fit thus judiciously appropriated. to associate for that purpose, must necessarily be of vast importance.

The knowledge obtained by a member of an as-

to consider some of the objections which have will have a good moral tendency; which indeed is a most important consideration.

The morals of the rising generation most impeworthy their attention and pursuit, and thus by mixing amusement with instruction, raise in them has been said that "it is not frowns, nor is it ar numents that will correct or pervert victous pracusefulness, respectability, and happiness, in this and a future world."

That logic. ethicks, physic and metaphysics, ences, excites no surprise; -but that the art of cile him to the strangeness of their customs. managing a farm, a house, and a family, should by so many be thought of little or no consequence,

Too many there are that imagine that reading, study thought or reflection, are of lit le or no use in the management of comestic concerns, and that it would be ridiculous to refer a housewife, or a dred. Fashions at that period did not reach any husbandman to books to acquire a knowledge of their respective avocations.

But it is hoped, and believed, that the time is at hand, when those who are required to manage a farm and superintend the domestic concerns of a It is not my object to undervalue, or to set a family, will clearly see the importance of acquire the time. In 1727, meat was only three pence side in the least degree, the knowledge which ing the necessary knowledge to enable them to every marvioual may, and ought to acquire, by ex- unite amusement with economy, and labor with persence and observation. No-my object is profit and by well directed industry, and judicious four; now, ten pounds to thirty.-London Sun. rather to show that if we act wisely, we shall economy, insure that respectability of character unite our own experience and observation with which preeminently belongs to that class of sothe experience, observation, and wisdom of past ciety who are the efficient supporters of all the ages, so tar as past experience has been tested, others. Surely that science which directs our and found to have had a heneficial result—and to conduct, or enables us to reform our mistakes, is my apprehension there are but two methods by entitled to our peculiar regard; and though it be to not at once discover which of the two modes and hence arises the advantage of oniting the ex-

An excellent trait in the French character .- In Cobbett's "Ride in France," is the following passage :- "I remark, as I go along, that the comself understand. There is nothing uncouth, nothing boorish, in their manners. They explain to a sufficient interest to divert their attention from you as well as they can, what you want to be places and practices calculated to fix upon them made acquainted with; and, when they do not habits that will infallibly lead to their ruin. It instantly comprehend your meaning, they seem as anxious to anticipate it, as if you were not a stranger, but rather one to whom they have been ticea: it is presenting a substitute, which is not used to talk. This is a great merit, and a mark that theory is altogether useless in agriculture; less interesting, but more useful, that alone will of intelligence in the French people. It couldes prove an effectual bulwark against vicious habits you to get along with them, which they cannot in the young, and set them in a way that leads to well do with us in England. A Frenchman is most completely not of his element in England : whilst an Englishman in France-(though the country may appear very strange at first) finds ir. should claim the dignity of liberal arts or ser- the courtesy of the people a great deal to recom-

> A comparison between 1727 and 1827 .- In the year 1727, hackney coaches were plain, awkward, clumsy things, with no springs, and their number did not exceed thirty five in the whole of London; at present they are increased to twelve hun place fifty miles from London, until they were nearly out; now they travel down in coaches, diligences, &c. in a few hours. Coaches were then two days and two nights going to Dover; they now perform the same journey in about a quarter or pound; now it is ten pence or a shilling Servants' wages then varied from two pounds to

Mineralogy .- We are he ppy to learn that Professor Cleaveland of Brunswick College, is about publishing a third edition of his excellent treatisc on mineralogy. It is the most copious work which we have upon this subject, and has been adopted which this can be accomplished—the one is by true that the wisdom obtained by experience, is as a text book by the professors of mineralogy it tradition, and the other by record—and can it be the least fallible, yet it often costs so dearly that Yale, Cambrilge, and we believe Amherst Col possible that there are any among us so stupid as the intrinsic value scarcely compensates the price, leges. He solicits from scientific gentlemen, gen erally, the communication of such facts concerning localities and peculiarities both mineralogica: Perhaps it may be objected, that to become a and geological, as may be within their reach, and

> Mammoth Pumpkin .- A Pumpkin, of unusua size, grew on the farm of John Reynolds, Esq. : few miles from Clarksburgh, Va. this season : i* weighed 320 lbs. and measured round the middle G feet. All that grew on the same vine weighed 840 lbs.

The child that is permitted to act habitually, passions, and the swing of the gallows, and its dent parents, whose folly and wickedness are equalled, in magnitude, only by the momentous consequences, that ensue, and the awful responsibility which the parents incur. The greatest cala mity that ever befol a child, is an indiscreet pa rent who knows nothing of family discipline .- E. More.

A shrewd observer once said, "that in walking

EXTRACTS

From an Address, to the New York Horticultural Society. By N. H. CARTER.

You need not be told, gentlemen, that no country opens so wide a field, and affords so many natural advantages, for improvements in horticulture, as the United States. Between the Alpine regions of the North, and the plains of the South, fanned by the breezes of the tropics-from the fir-clad hills of New England, to the orangegroves of Florida and Louisiana, we have almost every variety of climate, soil, and production. So boundless are the resources of our territory in these respects, that few indeed are the plants indigenous to other parts of the earth, which may not here find congenial localities, and be readily naturalized, by a very slight resort to artificial means. If I may be allowed to draw an illustration from the mixed character of our population, our soil and climate are as inviting to the evotics of other lands, as the freedom of our political institutions is to emigrants from foreign nations. We have room enough for both; and to both may the great Republic cheerfully open an asylum in its bosom, thereby augmenting its physical as vell as its moral resources.

Horticulture considered as a practical and useful art, supplying the wants, conveniences, and comforts of life, forms a very prominent object of this association, to which its efforts have hitherto been chiefly directed, and which should never be lost sight of in our future transactions. Viewed in this light, it ceases to be an abstract and speculative pursuit, but comes home at once to the interests-to the business and bosoms of all classes of our fellow citizens. Comparatively few individuals in any community, however intelligent and enlightened it may be, find time amidst the life, to make themselves familiar with the extensive and complex systems of botany. To the la boring classes especially, the volume of an intricate science is effectually closed:

" For knowledge to their eyes her ample page. Rich with the spoils of time, did ne'er unroll : Chill penury repress'd their noble rage, And froze the genial current of the soul."

But while only a small proportion of the communty may feel disposed to encourage horticulture as a science, all are equally interested in its success as an art. The high and low, rich and poor, learned and illiterate, are concerned in having the markets and their own tables supplied with vegetables and fruits of a good quality, in sufficient quantities, and at moderate prices. Such results are alone to be produced by systematic and continued efforts. However genial may be our climate, or fertile our soil, the valuable products of the earth will not spring up spootaneously, nor flourish without culture. Well stocked as our markets now are, and much as they have been amproved within a few years there is yet amply room for further advances in the variety, melioration, and abundance of the articles of daily consumption.

It is worthy of remark, that we first find man, oure from the hands of his Creator, placed in a to health, innocence, and happiness. Even the peared "in the cool of the day." And may not lits beautiful forests have wasted away, like the shaped tin tube, with the wide top of which he

pressed on the dewy leaf and the opening flower? And is not his voice yet heard in the chorus of the woods, in the fall of the fountain, and the whispers of the breeze?

The United States possess in abundance all the requisite elements for reaching the highest degree of excellence in this interesting department pioneers. But the necessity has now in a great of the arts, comprising, as our territory does, an measure ceased; and higher motives than those endless variety of surface and soil-picturesque of taste should induce us to preserve the shatterhills-irriguous vales-bright waters-luxuriant ed remains both of the human and vegetable woods, and unnumbered species of native plants; tribes. Justice and mercy plead in favour of the with a climate favorable to the cultivation of exo- former; while policy and patriotism urge us to tics. Indeed, nothing is wanting but the band of spare the latter. It is time to be frugal of the oak taste, in seconding the profuse liberality of na- upon our hills, whence are to spring the fleets of ture, to produce the happiest combination of rural a great nation; and to respect the pine, the still scenery, and to render our landscapes and gar- loftier lord of the forest, destined perhaps to bear dens among the first in the world. To the skies the American Eagle upon its top across the seas, of Italy our country unites the verdure and fertil- as it once bore the original of the emblem in its ity of England; and by a little attention, its ex- native vale, and to waft our future navies to new ternal aspect may be made to rival either, in va- victories. riety, richness, and beauty. Shall, then, these singular advantages be overlooked, or neglected? I trust, a very different sentiment prevails in the breast of every member of this association. Mere common poppy, seen in gardens. Turkey opium objects of taste, it is true, are of little importance, in comparison with the more useful and momentous concerns of life; but it should be remembered, that they form no inconsiderable item in the in its preparation. The East India opium is infeestimate of national character, as well as the sum rior to the Turkey, from the leaves and stems of of individual happiness.

Let it not be supposed, that I would limit the province of ornamental gardening to the walls of narrow enclosures-to flower-beds and parterres. On the contrary, its principles should be extendand public squares of our cities; to the countryseats of the wealthy; to the fields of our farmers; and lastly, to the ultimate home of us all, churchmore imperious cares, avocations, and duties of yards and cemeteries. In some of these particulars, the example of the French is worthy of all ness in modifying and alleviating the most painful imitation. To them, I believe, belongs not only the first idea of botanic gardens, but the more recent improvement of uniting such institutions with public premenades; or in other words, of combining science, taste, exercise, and amusement in one and the same establishment. Nearly every considerable town in France, has ornamented grounds of this description; and the plan has amounted to £567,871. The supply of Calcutta been extensively adopted in Great Britain. To the same nation is due the credit of having improved public cemeteries, by converting them into attractive instead of repulsive objects. A proper disposition of the dead, and a becoming tribute of respect to their ashes, by seeing that churchyards are neatly enclosed, shaded with ornamental trees and shrubs, with the addition of appropriate sepulchral monuments, should certainly not be subjects of indifference to the living. Wilson, the distinguished ornithologist, made a particular request, but a few hours before his death, that he might be buried in some rural spot, on the banks of the Schuylkill, where the birds might sing over his grave. The sentiment was true to nature ;for, let philosophy preach as it may, our cares and anxieties, our feelings and affections, will extend to the unconscious dust.

Unless some efficient measures be taken for the garden; as if such a retreat was most conducive preservation and reproduction of timber, trees, and shrubbery, our country will ere long be as remarkseculiar presence of the Deity himself hallowed able for its naked hills and arid plains, as it has

his footsteps still be traced in the garden-im- aborigines, who once made them their green and happy abodes. A war of extermination has been waged against both. To a certain extent, this was necessary, in the settlement of the new world. The advances of cultivation required, that the monarchs of the wilderness, moral as well as physical, should be hewn down by the axes of our hardy

OPIUM.

The opium for commerce is the product of the was formerly deemed the best, but it has been cultivated for several years in England, of a purer and better quality, owing to the great care used the plant being packed with the cakes, and often worked into the opium while in a soft state, probably to increase its weight.

English opium is generally in smaller cakescuts clear and smooth like liquorice, and is in a ed to the embellishment of the avenues, streets, great measure destitute of stalks, leaves, and

other impurities.

The consumption of this drug is almost incredible. It is an immense article of commerce, and an interesting paradox, from its extensive usefuldiseases, while at the same time it is one of the most fatal poisons. In the year 1800, 46,808 lbs. were consumed in Europe; and the quantity has increased annually ever since.

The Bengal government derived a revenue of £594,978, from the sale of it in 1809, and the exports from Calcutta to China alone, in 1811. opium in 1827, is rated as follows:

Bengal, 6570 chests-Mabia, 5000 do .- smuggled, 1500 do .- Turkey, 1000 do .- 14070 chests.

Although this article is prohibited by the Chinese government, yet 2000 chests are annually sent to Canton, and about 40,000 pounds are im-

norted every year to Canton.

The following method of cultivating it, is stated from recollection, but is believed to be substantially correct: The ground is dressed in the same manner as for a flower plat, and the seeds sown in rows, with room between for one person to walk through. When the flowers fall from the head, it is time to gather the juice. This is done by a person who goes in with a sharp instrument guaged to a proper depth, with which he scarifies the heads standing on the top of the stalks after the flowers have fallen. He proceeds through the field and returns by the next alley, scoring every head with one or more gashes. On arriving at the place from which be started, he retraces his steps, and collects the juice which has exbeen for its depth of woods and richness of foliage. uded, in a phial fitted with a sharp edged funnel-

two rows in two successive circuits, when he pursues the same course with all the rows in the field. The next morning he goes over again, collecting what has flowed during the night, and making new gashes, until the heads cease to yield. The fresh juice is then exposed to the sun in shallow pans, and after the watery particles are evaporated, it is moistened with oil of poppy seeds, so as to be made up into cakes, when it is packed in chests, with alternate layers of poppy flower leaves. It is sometimes adulterated with an extract from the stalks and the gum of the mimesa. There can be no doubt that it might be profitably cultivated in the United States.

CHAMBERS' MEDICINE.

We have read with great satisfaction the "Rearticle noticed is Chambers' Remedy for intemperance. Drs. Hammersly, Drake, Manly, Watts, Ives, and Johnson, the highly respectable committee to whom this subject was referred, inform us, that they employed Dr. G. Chiltun, an able and experienced chemist, to analyse the medicine, and that the results of his experiments show it to be composed of Tartar Emetic, Capsicum, Sulphur, Carbon, Cochineal and Gum. "If any doubts," say the committee, "could rest upon this result to stomach and bowels are precisely those which ought to be expected from tartar emetic-and externally applied it will produce the pustular erupthe tartar emetic which it contains-of its value, therefore, as a remedy for intemperance-or the danger resulting in some cases from its exhibition we need not here speak. Every professional man will know how to estimate it .- Am. Journ.

If the above report be correct, it follows (saya a correspondent) that any of our Medical men can furnish a remedy equally effacious as this celebrated remedy, for five cents, instead of five dollars, the price which is paid for this .- N. H. Register

MUSTARD.

There is a white seeded sort and a brown seeded. The white mustard is used in salads along with till he obtained a perfect recovery. the Cress or Pepper-Grass, and is sown and oultivated in the same way. The black is that which table-mustard is made of .- It is sown in rows, two feet apart, early in the spring. The plants ought to be thinned to four or five inches apart. Good tillage between the rows. The seed will be ripe in July, and the stalks should be cut off, and, when quite dry, the seed threshed out, and put by for use .- Why should any man that has a garden buy mustard? Why should he want the English to send him out, in a betile, and sell him for a quarter of a dollar, less and worse mustard than he can raise in fils garden for a penny? The English mustard is, in general, a thing fabricated, and is as false as the glazed and pasted goods, sent out by the fraudulent fabricators of Manchester. It is a composition of baked bones reduced to powder, France consumed only about fourteen millions of some wheat flour, some coloring, and a drug of pounds of sugar annually. The present annual some kind that gives the pungent taste. Who- consumption exceeds 80 millions of pounds .- Lit. ever uses that mustard freely will find a burning Gazette.

takes it off the head. He thus obtains all from in his side long after he has swallowed the mustard. Why should any man, who has a garden, buy this poiseness stuff? The mustard-seed ground in a little mustard mill is what he ought to usc. He will have bran and all; and his mustard will not look yellow like the English composition; but, we do not object to Rye-bread on account of its colour! Ten pounds of seed will grow upon a perch of ground; and ten pounds of mustard is more than any man can want in a year. The plants do not occupy the ground more than fourteen weeks, and may be followed by another crop of any plant, and very useful plant, and ought to be cultivated by every farmer, and every man who has a garden. Cobbett's American Gardener.

ports of the Medical Society of the city of New am going to mention, was of a gentleman who is owned by an ingenious mechanic who invented York, on nostrums or secret remedies." The first related to the doctor, and is now living at Dorset- the machinery during our late war with England. that there seemed to be no possibility of a recovtoo late for the first to do any good, all that was ed to attempt to ride into the country; but was so ness of the culture of silk, may be estimated from extremely far gone, that, at his setting out of the fact which we happen to know, that mulberry which the analysis leads, it could not fail to be town he was forced to be held up on his horse by orchards of ten years' growth, and upon land othremoved by the collateral evidences which may two porters; and when he got to Brentford or crwise of very little worth, are valued at \$200 an be brought in confirmation, from its exhibition beth Houaslow, the people of the Inn into which he acre. internally and externally-its effects upon the put were unwilling to receive him, as thinking he would die there, and they should have the trouble its manufacture of Combs of various sorts, comof a funeral. Notwithstanding, he persisted in his riding by small journeys to Exeter; and get be sure at first by the slow process of sawing but tion, which is peculiar to this metallic salt." This so much strength by the way, that though one one tooth after another, but now by the use of ma medicine then owes any efficacy it may possess to day his horse as he was drinking, laid down with chinery, invented in this country, and with one him in the water, and he was forced to ride part of the day's journey in that wet condition, yet he sustained no harm by it, but came to the above mentioned place considerably recovered; when, thinking he had then gained his point, he neglected to ride any more for some time. But afterwards finding himself relapsing, he remembered the caution which Dr. Sydenham had given him, at his setting out, that if he should be so happy as to begin to recover, he should not leave off riding too soon; for he would infallibly relapse and die, if he did not carry on that measure long enough; so he betook himself to his horse again, and rode

> On hardening articles made of steel wire, without bending them - This valuable process was employed by the late Mr. Rehe, of Shoe-lane, a most ingenious mechanic, in the following manner :

"The articles having previously been carefully heated to the proper degree, instead of cooling them in water, Mr. Rehe threw them upon the flat surface of a fixed block of cast iron, and instantly rolled them round, by sliding another flat plate of iron over them: and thus, by this revolving motion, he kept them perfectly straight, in the act of being cooled and hardened, between the metal plate and the block.

Sugar .- Under the domination of Buonaparte,

The town of Mansfield, in Connecticut has recently been several times noticed on account of its manufactures of silk. The Connecticut Register recently issued at Hartford, estimates the quantity produced at more than 3000 lbs. annually, and the value at \$20,000, which probably is not beyend the fact; but which is certainly a very considerable sum of money to be annually distributed as one item of income, among a population of 3000 inhabiting a comparatively unproductive soil: and that toe without any expenditure for machinery or outfit of any kind. The process is entirely even of mustard if you like. This therefore, is a domestic, until the raw silk is adjusted into large skeins resembling the condition in which it is imported into England and other countries from the East. The further process into "sewing silk" is now to considerable extent performed by water Effects of riding in consumption .- The cure I power, at a small factory in the town of Lisbon, shire, who was brought so low by consumption for the purpose of bringing into use the great quantities of raw silk of commerce, which had ery either by medicine or exercise; but, it being been captured by some of our privateers, and which from the singular manner in which it is put up. te be done was to be expected from the latter, laid no small tax upon New England ingenuity .-though the doctor did not think that even riding We have seen lately a paragraph stating that a would then do. However, the poor gentleman, Frenchman had established a Ribbon manufactory seeing there was no other hopes left, was resolv- in Windham, an adjoining town. The profitable

This town has been also somewhat known for menced at a very early period, and carried on to half the material; the teeth of two combs being cut out at heads and points from each other, pursucd with such expedition that a man is able to go through this process very neatly, at the rate of fifteen dezen in an hour.

Here it would also be wrong to omit to mention that Mansfield is entitled to the credit of having produced the invention of the Screw Auger, and this not so many years ago, but that some of our carpenters can well remember when the "Pod-Auger" (an instrument now or soon to be almost forgotten,) was their only dependence. The manufacture of this very useful instrument has also been a source of considerable profit. To all these might be added buttons, and several other articles, compesing in the whole an extent of profitable business, which is fast transforming this town from one of the least productive (and perhaps from this very cause) to one of the most wealthy in that enterprising State.

Good humour is the clear blue sky of the soul. in which every star of talent will shine more clearly, and the sun of genius encounter no vapors in his passage. It is the most exquisite beauty of a fine face -- a redeeming grace in a homely one. It is like the green in the landscape, harmonizing with every color, mellowing the glories of the bright, and softening the hue of the dark; or like a flute, in a full concert of instruments, a sound, not at first discovered by the ear, yet filling up the breaks in the concord with its deep melody.

AGRICULTURE IN GEORGIA.

The great importance of Agriculture, (in our eyes) and in those of every one we presume, who regards the vast extent and various productive capacity of our soil, has led us to notice every remark or hint which appears concerning it. The Milledgeville (Georgia) Journal, among a variety of other Reports, contains one on Agriculture and Internal Improvement, from Mr. Bevan, on the part of the joint Committee on those subjects, to which was referred a certain resolution of the Georgia House of Representatives. We select some particulars from it.

The continued depression of the cotton market renders it necessary, says the Report, that Geor- some opportunity in good weather to examine and wine; it should then be placed on a slow fire, and gia should give her attention to the rearing of supply as far as possible the necessities of your stirred until the honey is all dissolved, then pourother article, and to the improvement of that ex- bees. If practicable, the hive should be turned ed out into a jar or other vessel for use." tensive alluvial region, known as "The Pine bar- up, and the stool well cleansed and ventilated .yen Land," on which the present inhabitants glean Writers on this subject, tell us that the dysentea miserable existence. The Report concludes with Swift's aphorism, | food at evening, after sun-set, when the entrance then become feeble, and if you preserve your bees you will lose much of their labor the next season. Sugar is sometimes administered as food for bees, as well as clear honey. Mr. Huish considers the first as improper food, and the latter as dangerous, and often exposing the bees to the dysentery; and adds, "whenever honey is given. it should be mixed with some good old white

> "Dissolve one pound of sugar in a quart of good old ale, boil and skim it until it is clear, when ses and water boiled, with a little salt, may be a good substitute."

In treating of the feeding of Bees, Loudon observes that "Sugar simply dissolved in water killed with hunger, while some pounds weight of sngar remain in this state in their cells. The perience of hives not containing a pound of honey, preserved in perfect health through the the win-

Mr. A. S. Bugbee, of Northampton, has contrivdyoing the Turkey red. It is suited to sandy composition, which has invariably checked the ed a method of turning to account the natural activity of the common grey squirrel. "He has," says the Northampton Post, "a common cylindrinected some small brass wheels which move the machinery of a coffee and pepper mill Three one turn the wheel with apparent case. The power of each squirrel in the wheel is estimated by Mr. B. at sixty five pounds, and in an hour they grind a pound of coffee, popper, allspice, &c. The expense of the machine was about \$30, and the cost of the subsistence of each of the little

> Vulgar error respecting the putting of Spirits into the Boots or Shoes to prevent the effects of cold .- The custom of pouring brandy into the

struction in the bowels. The practice is adopted, on the supposition, that, because spirits, when swallowed, excite an universal warmth, and cause a temporary increase of circulation in the extremities, they must do the same when applied to the extremities themselves. But the reverse happens. Fluids, when evaporating, produce cold; and the lighter and more spirituous the fluid, the more quickly it evaporates, and the greater the degree of cold generated. This may be proved by a very simple experiment. If one hand be wetted with spirit, and the other with water, and both be held up to dry in the air, the hand wetted with spirit will feel much colder than the other; or if the bulbs of two thermometers be so treated, the mercury will be observed to fall much more rapidly and extensively in one case than in the other. Whatever danger, therefore, arises from cold or damp feet, it is generally enhanced by the practice alluded to.

Usefulness of the wren in destroying insects .- As a devourer of pernicious insects, one of the most useful birds is the house-wren. This little bird seems peculiarly fond of the society of man, and it must be confessed that it is often protected by his interested care. It has long been a custom in &c. as a place for it to build in. In these boxes they build nests and hatch their young. When the young are hatched, the parent birds feed them with a variety of insects, particularly such as are injurious in gardens. An intelligent gentleman was at the trouble to observe the number of times a pair of these birds came from their box, and returned, with insects for their young. He found that they did this from forty to sixty times in an hour; and in one particular hour, the birds carried food to their young seventy-one times. In this business they were engaged the greatest part of the day, say twelve hours. Taking the medium, therefore, of fifty times in an hour, it appeared that a single pair of these birds took from the cabbage, salad, beans, peas, and other vegetables in the garden, at least six hundred insects in the course of one day. This calculation proceeds on the supposition, that the two birds took only a single insect each time. But it is highly probable they often took several at a time.

To prevent burrowing of rats in houses .- Rats may be effectually prevented from burrowing under the foundation of houses, by making an offset of stone or brick, about two feet in breadth, and eighteen inches below the surface; and by carrying up a perpendicular wall from the edge of this offset, to within a few inches of the surface of the ground. The adoption of the same plan inside, will prevent the burrowing of these animals in cellars; for rats always burrow close to a wall; and finding their perpendicular course impeded, they take a horizontal direction as far as the offset continues, when they are again stopped by the outside wall. Thus baffled, they ascend and go off.

To preserve Pumps from freezing -Bore a small hole through the body of the pump beneath the surface of the ground, and above the upper bucket; the column of water above the upper bucket will then slowly leak out, and may also be raised again by a few strokes of the handle. In mild weather the hele may be plugged.

Dreadful accident .- At the execution of Levi Kelly, at Cooperstown, N. Y. for murder, a great concourse of people were assembled, about 2(10) of whom were on a wooden platform, erected by the keeper of the hotel for the accommodation of spectators, and about an equal number were under the platform. As the prisoner was brought out, the crowd leaned forward to see him, and at this moment the platform gave way, and fell with all who were upon it, to the ground. In consequence of being forced forward horizontally, it fell upon a much smaller number of persons, than would have been buried under it, had it fallen directly, but from five to ten persons were killed, and several so severely wounded that it was thought that they could not survive. In the midst of the confusion caused by this accident the prisoner was executed.

On the benefit derived from frequently stirring the earth about growing vegetables .- Plants are very much benefited by having oxygen applied to their roots, being found to consume more than their own volume of that gas in twenty-four hours; and when applied by Mr. Hill, to the roots of melons, hyacinths, &c. the first were found to be improved in flavor, the second, in beauty and many parts of the country, to fix a small box at in vigor. Every thing that promotes the presenthe end of a long pole, in gardens about houses, lation of oxygen to the roots of plauts, must be beneficial.

> The Niagara Sentinel gives the dimensions, &c. of a lad of 18, named Darius Whitman, now on a visit at Lockport-viz. 6 feet 3 inches high, 4 feet 8 inches round the waist, and 298 pounds weight! He is said to be comparatively lank, having lately had an attack of the ague, which pulled him down considerably.

Great Income.—The beautiful domain of Moor FLAX SEED Park in Hertfordshire, has just been purchased by FLOUR, Ealtimore, Howard & the Earl of Grosvenor. What with his enormous estates in London and Westminster, in Chester, Cheshire, Flintshire and Denbighshire-at Shaftsbury, Hindon, Stockbridge, and numerous other places, the noble Earl may, perhaps, be considered the richest land owner in Great Britain. His HOGS' LARD, 1st sort, new, income is estimated at from 270,000% to 300,000%. HOPS, No 1, Inspection per annum, which sum, immense as it is, is exceeded by that of the Marquis of Stafford, in a great measure derived from canal property. One only PORK, Bone Middlings, new, of Earl Grosvenor's mining concerns in Wales is let by him to a company for 20,000l. per annum; and within the last 25 years he has laid out more SELDS, Herd's Grass, than 700 0000 at his family out that 25. than 700,000l. at his family estate at Easton, near Chester .- Eng. Chronicle.

Transfusion of blood .- An English newspaper mentions a successful case of transfusion of blood from a healthy to a diseased patient. The latter was in a decline, and was one time in such a state of extreme exhaustion (from the loss of vital fluid,) that her friends felt confident that she was dead. A surgeon was sent for, who performed the very interesting oper-tion of transfusion of blood from a healthy subject into the veins of the exhausted patient, so successfully, that she had so far recoved as to walk out of doors .- Hartford Mercury.

Asparagus, at \$4 a bunch of 100 heads, is advertised for sale by G. Thorburn & Son, New-York.

Diep in Easton, on the 3d inst. Lieutenant Jesse Howard, aged eighty-eight years. Mr Howard was distinguished for his active and patriotic exertions in those times which "tried men's souls."

Account Books, &c.

Just manufactured a complete assortment of Account Books made of the best materials and in the next approved modern style adapted to every capacity of business. School Books, B. bles, Sc.; Paper of all kinds; the greatest variety of Sentenory, Av. to be found in the city, may be had at unusual low prices, at No. 96 & 98 Sate street, two doors east of Merchanic Row, by J. M. is agent for P. Byrnes' Quill and Wafer Manufacto.

MISCELLANIES.

FANCY IN NUBIBUS.

A SONNET COMPOSED ON THE SEA COAST. O! it is pleasant with a heart at ease, Just after sunset, or by moonlight skies, To make the shifting clouds be what you please, Or bid the easily persuaded eyes Own each strange likeuess issuing from the mould Of a friend's faucy; or with head howed low, And check aslant see rivers flow of gold Twixt crimson banks, and then a traveller go From mount to mount o'er CLOUDLAND, gorgeous land! Or listen to the tide with closed sight, Be that blind bard, who on the Chian strand. By those deep sounds possess'd with inward light, Behold the Iliad and the Odyssee

Rise to the swelling of the voiccless sea! S. T. COLERIDGE.

ANTIQUE POETRY.

The following eccentric, but tender and touching lines are from the "Exequy," a poem on the death of his wife, by Dr Henry King, bishop of Chichester, Eng. in the reign of Charles I.

Sleep on, my love, in thy cold bed Never to be disquieted! My last good night! thou wilt not wake Till I thy fate shall overtake; Till age, or grief, or sickness must Marry my body to that dust It so much loves; and fill the room My heart keeps empty in the tomb. Stay for me there; I will not faile To meet thee in that hollow vale, And think not much of my delay; I am already on the way, And follow thee with all the speed Desire can make or sorrow breed. Each minute is a short degree, And cv'ry houre a step towards thee, At night when I betake to rest, Next morn I rise nearer my west Of life, almost by eight houres' saile Than when sleep breath'd his drowsie gale

Thus from the Sun my bottom stears And my dayes compass downward bears; Nor labor I to stem the tide Through which to thee I swiftly glide.

Tis true, with shame and grief I yield, Thou like the vann first took'st the field, And gotten hast the victory In thus adventuring to dy Before me, whose more years might crave A just precedence in the grave. But heark! my pulse like a soft drum Beats my approach, tells thee I come; And slow howe'ere my marches be, I shall at last sit down by thee.

The thought of this bids me go on, And wait my dissolution With hope and comfort, Dear, (forgive The crime) I am content to live Divided, but with half a heart, Till we shall meet and never part.

Translated from Precis Historique sur les Moures D'Espagne, for the New England Farmer.

ANECDOTE OF AN OLD MOOR.

"When Gibraltar was taken by Ferdinand 4th, he expelled the Moors. Among the fugitives was an old man, who, observing Ferdinand, approached, and leaning on his cane, thus addressed him. "King of Castile, what have I done to thee or

made me leave this city. Taking refuge in the walls of Tariffe, your father Sancho assailed me close to so large a place as Paris, are built quite in there. Finally, I sought a grave in the extremities of Spain, on the shore of Gibraltar, and your fury has found me out even here. Point out to me the spot on earth where I may die undisturbed by a Spaniard.

LITERATURE OF THE MOORS.

A species of literature which was common among the Moors, and which the Spaniards have imitated from them is that of Romances and Novels. The Arabs were always and are still great story-tellers. In the depths of the deserts of Asia and Africa, under he tents of the Bedouins, they collect together in groups to hear some love story. They will listen in silence and follow the reciter with interest, and show by their tears how deeply they are affected by the relation.

At Granada they joined to this natural taste for stories, a love for music and singing.

CHARACTER OF THE MOORS.

The defects in their character which were the cause of their rum, were relieved by qualities which the Christians themselves could not but acknowledge. As brave and as cautious as the Spaniards, but less disciplined and less skillful, they were yet superior to them in the attack .-Adversity did not bend them down until they saw in it the will of heaven, and they then submitted without a murmur. The dogma of fatality contributed, no doubt, to give them this virtue. Religious observers of the laws of Mahomet, they practised with exactness the delightful law of charity; they gave to the poor, not casual bounty only, but a portion of their grain, fruit, flocks, and all their effects.

In the city and in the country the sick were sought out and attended with a most scrupulous piety.

Hospitality, always sacred among the Arabs, was not less so at Granada. Its exercise was to them no less a duty than a pleasure, and we cannot read without emotion the anecdote of an old man of Granada, to whom a stranger soiled with blood and pursued by justice applied for shelter. The old man concealed him in his house. At the same time the guards arrived, bearing the dead body of his son, just murdered by the stranger, and demanded the murderer. The unfortunate father refused to give up his host; but when the guards had gone, he said to the assassin, "Flee from my house, for it will be permitted to me to rursue you.

SHORT HAND METHOD OF CONVERTING THE MOORS.

When Granada capitulated, Ferdinand formally assured all the Moors who chose to remain, the free use of their worship. This treaty, however, was grossly violated. They were forced to abjure their faith upon their knees by the most disgraceful means. Ferdinand himself administered baptism, sword in hand, to more than fifty thousand of the vanquished.

The right of property respected in France.-The land just round Paris, consists in vineyards, or in gardens full of various sorts of vegetables for the thine? Your great grandfather Ferdinand drove tivation of peach, apricot, nectarine, and pluome from Seville, my native country. I sought an asylum at Xeres; your grandfather Alphonso besides the walls, which are built for the trees to den Seeds, Fluxer Seeds, &c. market of Paris, and walled gardens, for the cul-

grow against; and many of these walls, though the open ground, at a distance from any house, not enclosing a piece of ground, but merely one line of wall; so that, if the people passing were inclined to steal the fine fruit that grows in this way they might, without hindrance; nevertheless, the gardeners (who garden for profit) do not find any reason to apprehend such depredatioo.

When instead of the witnesses or the clients of each other, gentlemen of the bar pour their wit, or their abuse upon their own fraternity, the spectacle from without the bar is deemed not only amusing but appropriate. The following ludicrous scene of this sort is said to have lately taken place in our Marine Court, between two gentlemen of the bar-the one rather fat and the other rather small :-

Brother Fat .- (to the Court) I don't care what - says; he is only a moscheto, and I don't mind their sting.

Brother Small .- I beg your pardon, Mr. but it is a fact in natural history, that moschetos never sting hogs.

Brother Fat .- Is it so, Mr. -- ? then you had better inform your acquaintances of it; they'll be glad to hear it.

Brother Small .- Allow me, then, Mr. ---, to communicate it to you among the first.

Here the court, amid a roar of laughter, called the gentlemen to order .- N. Y. Advo.

White Mustard Seed.

For sale at the office of the New England Farmer, the best English White Mustard seed, by the pound or bushel.

Siberian Parsley.

Just received at the office of the New England Former, a few lbs. Siberian Parsley Seed. This plant is perfectly hardy, standing our secreest winters: and would probably be the best sort to sow with grass, as recommended in the last New England Former, as well as for cultivation in gardens. The Seed was originally procured from Russia, a few years since, by a gentleman in this vicinity.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

HORN PITHS.

Sin,-One of your correspondents asks if horn piths are a manure? I answer, they are, and an excellent one, too, for wheat. Within two years 1 have used nearly twenty loads, which I procured from the comb-makers. Attached to them are the roots of the horn, and some skin and hair, all of which induce fertility. My practice is to scatter them over the ground, and plough them under. Applied this way, they are some time decomposing. They would be better for the first crop if pulverized or broken, but they fertilize much longer when left whole. I think they are worth four times their bulk of manure from the yard. In addition to these, I use the comb-makers' horn shavings, which I think are superior to any other application; and I prefer them at eight cents the bushel, to stable manure at twenty five cents the two-horse load, the transportation of both being J. BUEL. two miles and a half.

FOR THE NEW ENGLAND FARMER.

WINTER EVENINGS.

The human mind cannot continue mactive. If we do not employ it in the acquirement of useful knowledge, it will be brooding upon mischief, or indulging in visionary schemes of happiness .-Neither can it remain stationary. If it does not advance in knowledge and virtue, it will retragade into sioth and depravity-if our fields are not sown with seeds of useful plants, thistles and other vicious weeds will spring up. To the farmer who is bringing up a family of children, these considerations are of momentous concern. If he makes his fireside the scene of innocent recreation and instruction-of kind feelings and affectionate intercourse-his children will prize home before the tavern, or the haunts of dissipation. But he must teach by example.

The winter evenings, from September to March, estimating three hours to each, amount to thirty. eight days of twelve hours each, or to more than a fifth of the time usually devoted to business and pleasure. The future welfare of children depends much upon the manner in which this fifth part of the winter is employed. Youth is the period in which habits generally become fixed-it is the seed-time of life-and whatever is sown, be it good or be it evil, is sure to produce its kind. If the mind is cultivated, and the seeds of useful knowledge sown in youth, the harvest of manheod will be respectability, wealth, and virtue.

Impressed with the influence of early habits, I have spent some time in devising a plan to render instruction amusing and to attach my children to home, by diversifying their winter evening employments, and by familiar illustrations, adapted to their capacities, of what they read. They have received partial instruction in music and drawing, and I have furnished them with the necessary books and instruments to enable them to pursue these studies. Their readings are such books as tend to improve the heart and expand the intel-

A FARMER.

COFFEE TREE.

Linnæan Botanic Garden, ?

MR FESSENDEN .- Toticing in your last number. a description of the Coffee Tree, I am also tempted to subjoin some remarks, more especially as I have the trees now, both in bud and in fruit. The leaves of this tree are about the size of the common Laurel or Kalmia latifolia of our woods, and much resemble those of the Lemon. They are of a fine shining green, stand opposite, and being very numerous, impart great beauty to the plant. At each joint the blussom buds are now presenting themselves; they are usually in pairs, of a slowy whiteness and most delicious fragrence, and as your correspondent remarks resemble those of the white flowering Jasmine.

A promenade through a grove or plantation of these trees is said to be delightful in the extreme, where the enlivening verdure of their foliage is only surpassed by the delicate blossoms, and the delicious fragrance which is inhaled from them .-In my Hot-house the flowers in general do not fully expand until March, and sometimes not until April ; the fruit from these ripens in autumn, at which period, a second crop of flowers is generally produced, but less numerous than the first.

The size of the berries may be adjudged by supposing the union of two grains of the coffee in one, with a thin pulp to cover them. They continue green during the period of growth, and then change to a bright cherry red, and interspersed among the fine foliage, contribute greatly to beautify the tree. The largest I have, is about six feet in height, of regular form and branching on all sides, and seems to flourish equally as well in the tub in which it is planted as in its native soil. The seeds vegetate freely, and it may also be in reased by cuttings, by which modes I have reared a large number of them, about forty of which I have at present.

On the plantations in Cuba the trees are gener ally kept down to about 6 or 7 feet in height, so as to render it easy for a person standing on the ground to collect the fruit, and it is said the average produce is but little over a pound of cured coffee from each tree. I have taken much pains to obtain the various trees and plants useful in the economy of life, particularly the spices, and have now the Cinnamon, Cassia, Pimenta, Black Pen-

lect—such as interest, while they instruct, the per, &c. Also, the Sugar Cane, Mahogany young mind. After eight, they are indulged with Banana, Plantain, Mango, Mammee, Alligator pear, Grandilla, Soursop, Cherimoyer, Rinvon, India papaw, various species of Guava, Annatto, wood, Caper, Cocoa nut, Calabash tree. Roseapple, Cotton tree, Chinese Gioseng, Bamboo, Rat-I subjoin the arrangement for the evenings of tan, about 50 varieties of the Orange, Lemon, Citron and Lime, &c. The introduction of hese and various other rare apecies, together with the erection of the necessary buildings for the accommodation of about 20,000 pots of Green house Plants, which form my present collection, has caused the disbursements for this department alone to be very great. But this does not prevent me from going on in the same progressive manner in the introduction of every thing which I consider useful or interesting, and at this moment I am making the arrangements for erecting an additional wing to my Hot-houses, which alone will be near 100 feet in length; and for each new house I pay some tribute to your city, for I receive from it all the glass necessary for the purpose, as experience has taught me it is much to be preferred.

Yours, most respectfully. WM. PRINCE.

HEMP AND FLAX.

We are indebted to the Hon. Mr. Everett, for several public documents; among the most important of which, is a report of the Navy Department, in relation to experiments on American water rotted hem when made into canvass, cables, and cordens. The commissioners of the navy have, for some time, been actively engaged in testing the quality of cordage manufactured of American hemp, compared with that made of the Russian material; and to aid their decisions, they have appealed to the experience of manufacturers and merchants, and the result of their enquiries has been, a conclusion that American hemp, properly cultivated, and suitably prepared, would be at least as strong and durable as that of Russian growth. The disadvantage under which American hemp has hitherto labored, is owing to the pertinacious adherence of our farmers to the old plan of dew rotting-a process so exceedingly slow, as to impair, in a very essential degree, the strength of the fabric. Where water rotting has been resorted to, better success has attended the cultivator, the hemp has worn a much handsomer colour, and has proved as strong in cordage as

We have, ourselves, in recent conversation with centlemen conversant with the cultivation of hemp and flax, had reason to know that American hemp may be raised with great profit to the cultivator, & with every advantage to the manufacturer. Indeed, one great advantage attends the use of the American article. That from Russia, as is state& in the report, is liable to be exceedingly heated, coming in large bulk in the ship, and to lose by that process, some of its strength-an evil to which American hemp is not liable. American hemp used in the manufactory of sail-cloth, has not proved ao well adapted to the purposes designed, and stout flax has generally been used. It is established, that water rotted American flax, is equal in strong cloth, to that of any other country. Hemp might be brought into this use, if gathered younger than is usual. A machine has been invented for dressing hemp and flax, without the process of rotting or steeping it-but as the gummy and mucilaginous matter is not, by that process, drawn out of the material, it may be doubted whether the strength is not liable to be lessened. Phila. Gazette.

From the New York Farmer.

On the cultivation of the Strawberry, by MR WIL-LIAM CURR, of New-York, read Feb 26, 1822. To the President and members of the Horticultural Society of New York.

GENTLEMEN-1 take the liberty to lay before you a short sketch of the method practised by me in cultivating the Fragaria or strawberry plant, together with a few observations which I consider will be found of advantage to the cultivator of plant, should always be selected in preference to that excellent fruit.

The patch on which I have my strawberries, had been under the same plant for several years. For the month of September, 1819, I laid on about five inches thick of well rotted manure, which I dug down with the old vines. I then set out plants of the Hudson kind of strawberry at the distance of sixteen inches each way, taking care to have them in line the long way of the ground. In the month of November I covered the plants with a thin coat of long litter, which I took off in the beginning of April, and pointed the ground with the spade, and raked it smooth. The ground was kept clean by hoeing till the fruit began to form. I then took short grass cut from the walks and spread between and under the vines, which had the effect to keep the fruit clean, the weeds down, and kept the scorching drought from penetrating into the roots of the plants.

As soon as the fruit season was past, I pointed covered as before.

but in 8 or 10 days the leaves began to make only fit for that purpose. their appearance. On the 22d of March, I uncov ered another part of the patch, a part of which I she usual way.

The first burned part continued to keep more forward than the others, and showed flowers eight days sooner than the anburned part of the patch. The unburned grew less rapid, and was consider- the climate; and, frequently, according to the deably less productive of fruit. That part burned mand or market for wood; for, in some cases, it with leaves was the most luxuriant in growth, the may be found more profitable to keep tolerably quantity of fruit nearly the same as those burned with straw.

The burning has this good effect, that it keeps the ground more clean of weeds, and will doubtless kill a great many insects and their eggs; be- for fuel; but it is a very easy matter to have sitsides, it clears the vines from all decayed leaves ting-rooms warmed, and all the cooking and other and hardened bark, gathered around the body of apparatus of the kitchen so contrived, as not to the plant: and by that means allows the free ex- require more than one third of the wood that is pansion of the leaves and flowers.

I am of opinion that leaves when dry, will answer the purpose of burning equally with straw, too thin, cattle should be kept out of it at all seasand their ashes prove a good manure

spread and run into a multitude of suckers, nor from any plants which do not produce plenty of is easily raised from cuttings, and, when cut and fruit. Those suckers which stand nearest the old dried, will answer tolerably well for fuel. tance from the fruit bearing plants.

There has some kind of strawberries been gest and frirest fruit. In this case the seed should be sown as soon as possible after the fruit or boxes, placed in the shade.

Should some of the members of this Society put this in practice, the result might be of general advantage, by improving the different sorts of this Country .- Farmer's Assistant. WILLIAM CURR. delicious fruit

FOREST.

Every farm ought to have a piece of wood-land, or forest, sufficient for fuel and other purposes .-Raising timber, for the purpose of fencing, will not often be found advisable. Farmers must eventually depend on making stone walls, or hedges, for the purpose of enclosing their lands. in the grass between the beds. In September, But wood and timber sufficient for fuel, for build-1820. I cut out all the superfluous runners and ing, for carriages, and implements of farming, dressed the bod, and in the month of November cannot be dispensed with. Of these, the farmer will always find it most advantageous to keep the On the first of March of last year, 122I, I took requisite stock himself, and not only rely on oththe covering from a part of the patch and replacters for purchasing it. Nor is it advisable to have ed it with one inch thick of straw, which I burn- his woodlands separate, and at a considerable dised off, as directed by Dr Miller. I then gave a tance from his farm; unless it be in parts of the slight hoeing and raking. At this time there was country where part of the lands are too valuable hardly the least trace of vines left on the ground; to be kept in wood, and other adjacent parts are

When the farmer is clearing up his farm, he ought to reserve, for woodland, that part which is burned with straw as before, and the other part least adapted for tillage or for grass. Land which with a parcel of dry leaves, which I laid on two is swampy with a thin soil over a sandy bottom; inches thick. The remainder of the patch I un- that is rocky and hilly; or that is dry, ponr, or covered in the beginning of April, and dressed in very gravelly, may do well for woodland; while it would answer but indifferently for tillage.

The quantity of ground to be set apart for this purpose must depend on the size of the farm; the quality of the soil, of the woodland; the nature of good land in wood, then in any other cultivation. Of the natural growth of wood, it will require as much as twenty acres, or more, to keep two fires, according to the common method of using wood commonly used.

To thicken a forest, or to prevent its becoming ons. The seeds, or cuttings of trees, of rapid I shall now give a few observations concerning growth, should also be set, or planted, in every the selecting of proper plants for planting. A part that becomes destitute of growing wood. If great deal lies in choosing proper plauts; for if woodland be suffered to become so thin, that the they are taken promiscuously, the greater part sun can get in and cause the ground to be coverwill prove barren, producing plenty of flowers but ed with a sward of grass, this will prevent the no fruit. Those when examined will be found to further growth of young timber; and in this way want the female organs of generation; that is, the ground eventually becomes stripped of all its they will have abundance of stamina, but few or growth. This, however, is not the case with the no styles; so that it often happens among those locust, as it encourages the growth of grass barren plants, that some of them have a part of an amongst it, and in this situation grows very rapimperfect truit formed, which sometimes ripens, idly. Perhaps the farmer will find, when he is Plants ought, therefore, never to be taken out of reduced to the necessity of planting wood for old neglected beds which have been allowed to fuel, that this tree will answer his purpose best-

The Lombardy poplar also grows very rapidly,

The easiest method of raising the locust is as those produced from the trailing stalks, at a dis- follows: Plant, in the first instance, about fifteen or twenty trees on an acre; when they have got to be twelve or fifteen feet high, and their roots greatly improved by seed selected from the lar- well extended, run straggling furrows through the ground, and, wherever the roots are cut with the plough, new trees will start up, and soon stock is eaten. The best way is to sow the seed to pots the whole ground with a plentiful growth. This tree has been but lately introduced into general use in France; and it is said to be there valued more than any other which is cultivated in that

SCRATCHES, OR SELENDERS.

This is a disorder between the hunder pastern joints and hoofs of horses, consisting of eracks and soreness, with suppuration. It is troublesome commonly in the winter season only. "Nothing tends so much to prevent grease and swelling of the legs, as frequent hand-rubbing, and washing the heels carefully with soap suds, as soon as a horse comes in from exercise. In inveterate cases where the disease appears to have become habitual in some degree, a run at grass is the only remedy; if a dry pastore be procured where a horse can be sheltered in bad weather, and fed with hay and on s, it will be found extremely convenient, as in such circumstances he may perform his usual labor, and at the same time be kept free from the complaint."-The Complete Farrier.

AGRICULTURAL IMPROVEMENTS.

There are few individuals who hold a more distinguished place among agricultural improvers than the Earl of Egremont : forty years ago, the Stag Park, at Petworth, consisting of between seven and eight hundred acres of land, presented a wild forest scene, overspread with furze, stunted timber-and rubbish, and would have been dear if let at five shillings per acre. Somewhere about the year 1790, the noble owner of this unproductive tract, undertook to improve it; the timber was felled-the underwoud grubbed-every part of the ground has been since effectually drained-and the whole enclosed and divided into proper fields, by neat and regular white-thorn hedges. Under a well arranged system of tillage, it yields barley, tares, and turmps-clover, rye, chicory, rape, and othe artificial grasses, in great profusion; the crops are so luxuriant, that few tracts which let even for thirty shillings per acre, ean be considered more productive. Ten quarters [eighty bushels] of oats, and five quarters of wheat are now raised upon an acre of land, on which

a sheep would have starved before this improvement.

Little more than fifty years ago, Clumber Park, which belongs to his grace the Dake of Newcastle, and contains no less than 4000 acres of land, was a black, dreary, unproductive heath, within the limits of the ancient and extensive forest of Sherwood. About 1760, the genius of agriculture lighted upon this desolate waste-a magnificent mansion was halt by the noble owner-the heath disappeared-2000 acres were planted-which now exhibit the agreeable appearance of thriving ing 2000 acres, under a spirited and intelligent system of husbandry, yield excellent crops of different grains and grasses ;-besides other live stock, the sheep fed on a district which half a century ago was perfectly barren, amount at least to 4000 annually .-- Lon. Quar. Review.

Extracted from Deane's New England Farmer.

SEEDS OF VEGETABLES,

The last product, by which their species are propagated, being frequently all the fruit of a plant, but sometimes only a part included in the plant. Every seed contains a plant in embryo. The embryo, which is the whole future plant in miniature, is called the germ or bud; and is root ed in the cotyledon, or placenta, which makes its involucrum, or cover. The cotyledon is always double; and the middle, or common centre of the two, is a point or speck, namely, the embryo plantule, which being acted on by the warmth of the sup and of the earth, begins to protude its radicle or rout, downwards, and soon after, its plumula, or bud, upwards; and as the requisite heat continues, it draws nourishment by the root, and so continues to unfold itself and grow The two cotyledons of a seed, are a case to the little embryo them of air. plant; covering it up, and sheltering it from injuries, and feeding it from its own proper substance; which the plantule receives and draws to itself by an infinite number of little filaments, One part of the composition of this balsam is oily the vessels of the embryo, wnich are too fine to fruit. admit so thick a fluid. Linnæan Botanic Garden, } Feb. 20, 1828.

MR FESSENDEN-I send you herewith some further extracts from my Treatise, (now in press) which you can publish as "Extracts from Prince on Horticulture."

> Yours most respectfully, WM. PRINCE.

Of all the fruit cultivated in the United States there is none more generally esteemed than the grape; yet, in the middle and northern states, this fruit is seldom met with in perfection except in cities. The Proprietor having attended particularly to the cultivation of the grape for twenty years past, can confidently assure those who wish to have this fruit in perfection, that they may depend on their vines producing well if they will attend to the following directions; for although a season may sometimes occur when the cold and wet will retard the ripening of the fruit, yet even in the worst seasons a tolerable crop may be calculated on.

There are two causes why the cultivation of country, attention to which is indispensably necessary: the first is the proper selection of those kinds which are suitable to the respective climates, and which in this latitude should come to perfection by the middle or end of September; the second is the want of attention to the culture requisite for ripening the wood, which in cities is effected by the dry warm air with little or no care, but in the country requires art and attention to produce the desired effect. I have, therefore, given the following list of grapes, with brief descriptions of their qualities, &c. followed by a general comment on the culture and properties of the vine, which I hope may be considered as useful to those not felly conversant with the subject.

Many of the grapes will be found to differ essentially from fruits cultivated under similar names in some parts of the United States, as in many instances the possessors of grapes of doubtful origin have attached to them the names of old culated to succeed for the same purpose in this far north of where this grape is found to succeed, established fruits. This practice, so common in country. our country, and so calculated to disseminate error, cannot be too greatly deprecated.

So confident has the Proprietor ever been of the success which would attend the culture of the vine in this country, and of the utter inconsistency of the fallacious ideas which have been advanced to the contrary, that he has invariably continued to extend his collection of vines, by importations, of the choicest kinds from every clime; and as he has, during the seasons of 1826 and 1827, had near 190 kinds to produce fruit equal to that of France, nearly all of which ripened in August and early in September, he considers these doubts as entirely set at rest. Specimen vines of every kind have been planted out for bearing, and persons desirous of seeing the fruit can view them at the season of ripening. Such persons as desire a selection of varieties most suitable to their particular localities, can have the selection made by the author. It is intended, in the copious work now preparing on "American Horticulture," to

1. July Grape, or Morillon Harlif .- This is also called the Madeleine; it is the carliest grape August.

This is a round grape, with a thin skin, and of ripen about the same period, and in this vicinity delicate flavor; it is a great bearer, and resem- are at maturity the beginning of September. bles the White Sweet Water in almost every respect, except that it ripens much earlier, being grape, also called Auvernat Gris, is used in conusually in perfection from the 20th to the end of nexion with the Auvernat Blanc, and Auvernat August. It is recommended as particularly suita. Rouge Claire, to form the far-famed Champaigne ble for the country, and for more northern lati- wine. The bunch of this is short, unequal in its tudes, where, with attention, it will be sure to form, and moderately large; the berries are round, yield plentifully and regularly.

cate, and replete with very agreeable juice; the times called Grisset Blanc; ripe in September. berries on the sides of the branches next the sun are often clouded with spots of a russet colour .-This grape flourishes admirably in our cities, where large quantities are annually sold in the the bunch, that in very rich soils it is not uncompounds. It is somewhat singular, that although it for the remainder. The fruit when ripe, is of a flourishes without protection in the city of New yellow colour; ripe in September. the vine has not been successful throughout the York, yet I have never known a grape more senunprotected in winter, it is when young killed to the ground. It is therefore not recommended for the country in this latitude.

9. Black Sweet Water .- This is a roundish fruit, growing in small compact bunches, is very sweet, and ripens in September.

6. Meunier, or Miller's Burgundy .- This is one of the earliest grapes; the berries are black, of moderate size, rather oval, and pretty closely set on the bunches, which are short. Its leaves par ticularly when young, are covered with a white down, which easily distinguishes it from others, and whence it derives its title. The juice is pleasant and vinous; it is an excellent wine grape, and produces well; is very hardy, a sure grape for a crop, and is one of those that will succeed farthest north. It enters largely into cul ture in the vineyards of France, and is well cal-

89. White Morillon .- The berries are nearly round, and form a bunch of good size; the fruit in flavor resembles the Black Morillon, but is the experiments with the above grape, which is, rather more sweet; it is a pleasant early table that if our season is in reality shorter than in fruit, and ripens at the end of August or beginning of September.

Morillon; the berries are on some bunches black, on others white, but very frequently black, white, perfectly well in that locality, but he covers the and striped on the same bunch; the fruit is similar to the Morillon Noir in quality, being pleasant, and ripening early. It is sometimes called Raisin de Suisse, and by others Morillon Panache. I ton, and for some distance to the north of it; pose. ripens end of August or beginning of September.

7. Auvernat, or Pineau Noir .- This is a wine grape much cultivated in Burgundy; the berry is not large, but closely set on the bunch, and of rather later than the white. agreeable flavor; the bunches are but of moderate size. It is often called Pineau Noir, but is insert engravings of a number of varieties of the quite distinct from the following; ripens beginning of September.

Pineau Franc .- A fruit of minor size and oblong, with small hunches of a form somewhat con known in France. The bunches are small, the ical, and the berries closely set on the bunch; it fruit is also small, of a deep violet colour, and is not the most productive, but its fruit is of ex-sweet, and of a musky flavor.

pleasant flavor, but it is not much esteemed, ex-cellent flavor, and produces the most delicate cept for its early maturity; ripens here early in wines of Burgundy. The finest vineyards of that part of France are most composed of the varieties 2. White Muscadine, or Early Sweet Water .- of the Pineau, and of the Morillon. They all

70. Pineau Gris, or Grey Burgundy .- This pretty close, sweet, finc flavored, and of a grevish 8. White Sweet Water.-This has very large colour. Formerly many vineyards in France were round white berries close on the bunch, which is entirely composed of this grape, and at present it of a good size; the skin and flesh are very deli- ferms a large proportion of several. It is some-

68. Pineau Blanc, or White Burgundy .- This grape is also called Bourguignon Blanc; the berries are somewhat oblong, and so closely set on shops, and some bunches have weighed near two mon for a portion to fall off in order to give space

98. Bourguignon Noir .- This is another variesible to the early frosts in the country, where, if ty of the Morillon, and is somewhat allied to the Pineau; the berries are, however, less closely set on the bunch, and the fruit less oval than the latter; they are black and sweet, and the bunch is often winged or shouldered. It is cultivated in connexion with the others referred to in the fine vineyards of Burgundy, and ripens at the same time.

> 26. White Chasselas, Royal Muscadine, D'Arboyce, or Chasselas Blanc .- This has round amber-coloured berries, of moderate size, thin skin, and soft juicy flesh; the bunches are very large; it is a great bearer, and ripens in September.

This grape, which is the most cultivated for the table in the middle of France, but which does not come to perfection in the north of that conntry, unless in very favorable localities, does not fail to regularly ripen its fruit in the vicinity of New York; and when excellent wines are made it proves at once the fallacy of the assertions made by some, that vineyards cannot succeed in this vicinity. One circumstance is fully proved in some parts of France, where it flourishes, still, that its greater intensity compensates for the 80. Striped Aleppo .- This is a variety of the shortness of its duration. Col. Clapp, of Oxford county, New York, has found this grape to ripen vines in winter; they ripen with him the beginning of September.

The varieties of the Chasselas are considered in France among the finest of their table grapes, consider this grape would mature its fruit at Bos and are very extensively cultivated for that pur-

27. Red Chasselas .- This is similar to the white in size and shape, but it is of a red colour next the sun; it is considered a good grape, and ripens

35. Golden Chasselas .- A round fruit of amber colour, melting, sweet, and of excellent flavor; the skin rather thick, and the bunches are of good size; leaves pretty deeply indented, and on a long petiole; ripens in September.

Musk Chasselas .- Rather smaller than the above, and ripens later; a white, round berry,

40. Cioutat, or Parsley Leaved .- This is a variety of the Chasselas, with finely cut or divided leaves; fruit of fine quality, delicate and juicy; the berries and bunches size of the White Muscadine; ripens early in September. There are two varieties, the red and the white.

long, and terminating to a point, and the berries pretty closely set; the juice luscious and musky, and of exquisite flavor; perhaps no grape is superior to this as a table fruit. It has been remarklarly favorable; at Long-Island it ripens in Sep. cipice, and by these means gained a large additember.

16. Red Frontignac, or Muscat Rouge .- This grape ripens earlier than the preceding, its berries being less closely set on the bunch; it is also size : ripe in September.

has very large round fruit, covered with a meally bloom, and of a very fine flavor. It is called, at the Cape of Good Hope, the Black Constantia;

ripens in September.

17. Violet Frontignac, or Muscat Violet .- The leaves are similar to the white variety; the berries are large, oblong, of a violet colour, and high musk flavor; they are powdered with a fine bloom, and are very delicious. I consider it one of the best table grapes; ripens in September.

14. Grizzly Frontignac, or Muscat Gris .- The berries a e round, tolerably large, colour brown, red and yellow intermixed, and they have a high musky perfumed flavor; ripens in September.

18. White Muscal of Alexandria, Malaga, or Alexandrian Frontignac .- This is of high musk flavor when it is at maturity, for which purpose it requires a very warm situation; the berries are very large, oval, and of regular form, without being too closely set; bunches of beautiful ap-To be continued. White Muscadel.

In Congress-House of Representatives. SILK AND SILK WORMS.

The Speaker laid before the House the following letter :-

Washington, Feb. 1, 1828.

SIR,-I have the honor to present to Congress, through you, a treatise on the rearing of Silkworms, by Count Von Haggi, of Munich, who sent it to me for this purpose. The Count has seen the Resolution of the House of Representatives, directing the compilation of a manual on the culture of silk, and was desirous to promote the patriotic views of the House, by sending the result of his labors on the same subject, and the evidence of the good will be bears the United Stetes.

> I have the honor to be, Very respectfully, JAMES MEASE.

The Hon. Mr. Stevenson,

Speaker of the House of Representatives.

The Letter, and the Treatise accompanying it, were referred to the Committee on Agriculture. It was also ordered to be translated into the English language and printed, with the plates there-tillage. Flowers are divided into annuals, bienin contained.

REMOVING ROCKS.

Travels and Adventures in Southern Africa," I. mode of removing rocks which may obstruct the ground annually, but spring up again every spring. course of canale; and as this subject has become I have not made separate lists; but have included 13. By which is tuberous, is taken up in the fall, dried in this simple process, immense blocks had been the sun, and put by in dry sand till spring, when 15. Black Frontignac, or Muscat Noir .- This split, and rolled from the path of the water- it is put into the ground again. And, during the course .- U. S. Gazette.

From the Hampshire Gazette.

MR JUDD-An article in your last from Niles' Register says: " Already the farmers stand with whetted knives to kill off these useful animals," (sheep.) A friend from Genessee River informs me that many of the farmers in that part of the country are now killing off their sheep. One man in Livingston Co. who went from Northampton, was butchering his flock at the rate of 50 per day. He gave the meat to his hogs. Pork is worth only from 21 to 3 cents in Rochester; of course mutton must be dog-cheap. This destruction of sheep will gratify those who are so anxious to have us purchase British wool, meat, and grain, in the shape of British woollen cloths.

manner.

From Cobbett's American Gardener.

FLOWERS AND ORNAMENTAL GARD-ENING IN GENERAL.

I shall now proceed to give an Alphabetical List of such flowering Trees, Shrubs and Plants as I think worthy of cultivation; or, rather, that I myself would wish to have about my house, or in my garden. As I go on I shall state some particulars here and there relating to propagation and management; but, to be very particular would be superfluous, seeing that such full directions have proprietor's wife or daughter. been given in the former parts of the work, as to the sowing of all seeds, great as well as small; as to the raising of trees and plants from cuttings, slips, layers and suckers, and as to cultivation and

nials, and perennials. The first blow and die the In perusing a new work, entitled "Thompson's year they are sown; the second blow the second year and then die; the third sometimes blow the was struck with what I conceived to be a novel first year and sometimes not, and die down to the

LIST.

ALTHEA FRUTEX .- It is raised from seed, or pods are full. Sow in the spring. Seed produces

ANEMONE .- This is a very beautiful flower, and summer, it sends out young roots, which must be taken off and planted out, to become blowers .-There is a great variety of colours and of sizes of this flower.

ABBUTUS .-- A pretty ever-green, as well known as the oak tree; and is to be got every where.

ASTRE (China) .- Astre is French for star, and this flower, in its shape, resembles a star to our view. It is annual, bears great quantities of seed, and is sown early in spring. An infinite variety of colours, and great quantities of blossoms. It gives no smell; but a clump of it furnishes a great mass of beauty to the sight.

AURICULA .- This is one of the flowers, the sorts of which are distinguished by having awarded to them the names of famous men and women, famous cities and famous battles, and so forth. It may be raised from seed; but the flowers proceeding Preparations of Spruce. - Early in the spring from plants so raised, do not resemble the flowers cut off the young branches of the pine or fir of the mother plant, except by mere accident. It pearance; when perfectly ripe they are of a fine tree, three or four inches in length, and break is a chance if you get a fine flower from a whole amber colour. I consider this the same as the them into small pieces; boil them in water, and sown bed. Now and then one of this description after filtering the extract through a sieve, add to comes, however, and this adds to the list of names, sixteen gallons of it, about six pounds of sugar. if it happen to be one of the like of which has not It may then, by boiling, be reduced to a syrup made its appearance before. Auriculas are, therewhich will keep in bottles for a length of time, fore, propagated by parting the roots, and every For beer mix three pints of this extract with root sends out several young places annually,thirty of water, boil it for about two hours, and When sown, they do not blow till the 2nd year; when cold, put it into a cask, [a fresh emptied but the old roots last for many years. Some of wine cask is the best] and ferment it in the usual these should be potted, and kept to blow in the green-house. If planted in the natural ground, they ought to be covered a little in the winter. There are many hundreds of sorts with names .-So many indeed, that the godfathers in England have been so put to it for great personages to baptize the flowers after, that they have been compelled to resort to the heroes and heroines of Romance; accordingly they have Don Quixotte and Sancho. However, vanity supplies the florists, as well as the ship owners, with a great store of names, and auriculas, like ships, are very frequently honored with the names of the original

> AZALIA. - That little American Honeysuckle that impedes our steps when shooting on the skirts of woods. It, however, blows profesely, though it has no smell like the English honeysuckle.

Balsan is an annual and a most beautifut

cut down. I have seen Balsams in Pennsylvania would live out the winter in this country. 3 feet high, with side-branches 2 feet long, and with a stem much bigger than my wrist, loaded with beautiful blossoms. Plant, branch, leaf, flower; all are most elegantly formed, and the colours of the flower extraordinarily vivid and various .--There are, however, some more double than others, and some variegated. The seed of these should be sowed, and it comes in great abundance. The flower of the Balsam has no smell.

BRIAR (Sweet) .- A well known shrub of the rose. Rows of it carefully planted and proned make very good hedges, and it will grow in almost any ground, though fastest in good ground.

CAMELLIA .- This shrub, which is of the laureltribe, has lately been introduced in langland from Japan. It bears a flower, which, when open, resembles a good deal a large full blown rose; and colours. It is raised, doubtless, from seed : bot it may be grafted on the Hawthorn; and, I dare sold at 20 or 30 pounds each. By this time they are probably sold at a dollar. The plant as well tings for grafting may easily be brought from its under the specious name of Cowslip-wine .any of the American laurels.

CARNATION-Here is beauty and fragrance, and both in the highest degree. There are vari- lip. ous sorts, distinguished, like those of the Auricula, does not blow till the second year. It is usually propagated by layers. While it is blowing, it sends out several side shoots near the ground .with a little stick with a hook at the end of it .-A little cut, or tongue, is made on the under side cus begins to appear. of the shoot; and thus the head of the shoot is brought upright. The part that touches the ground is well covered with earth; and roots come out here before the fall. Then the stalk which connects the young plant with the old one is cut off; the young plant is transplanted, and the next year it blows. The old root does not stand another year well; and, therefore, its branches are thus made use of to keep up the race and the sort. Carnations are rather tender as to frost, and must be well covered in this country to live through the winter. It is best to put them in large pots to give room for laying; and to keep them in a green house in winter, or in dens are sometimes as broad as a quarter of a some house, where they can have sun and air .-Hswever, they merit all the pains that can be be- chicken Daisy, that has a ring of little flowers surstowed upon them.

CLOVE .- Is only a more hardy and less esteemed sort of Carnation, which see. It may be pro- blows the second year. It is perennial. pagated like the Carnation; or, by cuttings, which is the easier way. Instead of laying down the side shoots, you cut them off. Then you cut away the hard part of the shoot, strip off three or four tobacco in New York, as a profit ble crop. A of Dutchess, New York, published in Memoirs of make a little split in the butt of the shoot, and tions as the result of an experiment, made by him following passage, which suggests an important

plant, with great abundance of flowers. Sow early in August. The young Cloves will have the State. He is confident that the soil and cliwhen you sow Melons, at a distance of four feet; roots in the fall; and you may transplant them leave only one plant in a place; let the ground into the open ground or into pots to blow the next be rich and kept clean; it will blow early in July, year. The old Clove plant, wil., however, blow and will keep growing and blowing till the frost for many years. I should think, that, with good comes, and then, like the cucumber, it is instantly covering, such as directed for spinach, Cloves

> COLUMBINE .- A perennial. Very common ; but very pretty.

CowsLip .- This is one of the four flowers, without which English pastoral poetry would be destitute of that which awakens the most delight. fol ideas. The Cowstrp, the Primrose, the Violet, Saratoga, 12.857-Gennessee, 10.903-Monroe, species of writing. They all come early in the kin-, 2.408—Onondaga, 19762—Chenango, 1,420 spring; and are all beautiful. Neither of them Rensselear, 1.239—Schenectady, 1.940—town of is seen here, and they all might; for they will Newport, N. H. 1,220-Total, 719,296 lbs. bear any severity of weather. The Cowslip is of the Polyanthus tribe. It is of a delicate vellow colour, and sends forth many blossoms from the same stem, which rises about six inches from the ground It may easily be propagated from seed, which it bears in great abundance, but, when you once have a plant, the easiest way is to propagate these flowers, on different plants, are of different from offsets. The plants raised from seed do not blow till the second year. The plant is perennial. The flower has a delicate sweet smell, and also say, on the Crab. Some of the plants have been sweet taste, as a proof of which, cart-loads of the may be done by means of artificial heat, either in flowers, plucked from the stalks, are sold in London to make "wine" with; that is to say to fur as the flower are handsome; and certainly cut-nish crinkers with an apology for swallowing spir-England. They will stand the winter as well as The leaf of the flower very much resembles in a cheap mode of raising encombers; by which he shape the under lip of a cow, whence, I suppose, our forefathers gave the plant the name of cow's-

CROCUS .- A bulbous rooted plant, very well by names; and what is said of the seed of the known. It is recommended by its earliness. It is Auricula applies here. If sown, the carnation perfectly hardy. The only thing to do, when it is once planted, is to take care that it does not fill all the ground near it. There are yellow, bloc and white Crocuses. And they are pleasant These are pinued down in August, to the earth, when nothing clse is in bloom, except, at least, the Snowdrop, which departs soon after the Cro-

> Daisy .- I cannot say, with Dryden's damsels, in one of his fine poems, that "the Daisy smells so sweet; for it has very little smell: but it is a most beautiful little flower, and blows without short off. Let them stand in this hed till your ceasing at all times when the grass grows, howev- cucumbers sown in the natural ground come up; er little that may be. The opening of the Daisy then make some little holes in good rich land, and is the sure sign that there is growth going on in taking a pot at a time, turn out the ball and fix it the grass; and these little flowers bespangle the lawns and the meadows, the green banks and the glades all over England. Their colours present an endless variety; and those grown in gardens of course furnish plants for thirty-six hills of cuare double. The field daisy is single and about cumbers, which, if well managed wil keep on the size of a York Sixpence. Those in the gar-bearing till September. Those who have hot bed dollar. And there is one sort, called the Hen-and rounding the main flower. This plant may be raised from offsets or seeds, in which last case it

(To be continued.)

Tobacco .- Gov. Clinton, in his last message to enough." the Legislature, recommended the cultivation of

mate are both well adapted for raising the high priced yellow tobacco, but not so good for dark low priced tobacco, [used for chewing,] as the Southern States.

Hops .- E. A. Le Breton, inspector of hops in Albany, on the 24th ult. made a report to the Legislature, from which it appears he has inspected within the year, (ending the first of Jan. 1828) 2 927 bales of hops, weighing 719,296 lbs. raised and presented from the following counties. Madison, 390,937-Oneida, 222,625-Otsego, 47,115 and the Daisy, are of endless recurrence in that 5,844-Herkimer, 5,152-Albany, 4.830-Tomp-

BOSTON, FRIDAY, FEB. 22, 1828.

EARLY CUCUMBERS.

To obtain cucumbers a month or six weeks earlier than what the soil and climate would naturally produce them, is sometimes a very desirable. object, especially with market gardeners. This hot-beds, or hot houses, according to rules given in treatises on gardening; but will require much labor, skill, care, and expense. Mr. Cobbett, in his American Gardener, paragraph 217, describes says, you may "have them a month earlier than the natural ground will bring them." His directions are as follows: "Make a hole and put into it a little hot dung; let the hole be under a warm fence. Put six inches deep of fine rich earth on the dung, sow a parcel of seeds in this earth; and cover at night with a bit of carpet or sail cloth, having first fixed some hoops over this little bed. Before the plants show the rough leaf, plant two into a little flower pot, and fill as many pots this way as you please. Have a larger bed ready to put the pots into, and covered with earth so that the pots may be plunged in the earth up to their tops. Cover this bed like the last When the plants have got the rough leaves out, they will begin to make a shoot in the middle. Pinch that in the hole. These plants will hear a month sooner than those sown in the natural ground; and a square yard will contain thirty-six pots, and will frames, or hand-lights, will manage this matter very easily. The cucumber plant is very tender and juice; and therefore, when the scedlings are put into the pots, they should be watered and shaded a day or two; when the balls are turned into the ground they should be watered and shaded with a bough for one day, that will be

In a Treatise on Gardening, by J. Armstrong. writer in the Rochester Daily Telegraph, men- the New York Board of Agriculture, we have the then, with a little smooth pointed stick, plant last summers that it is a more productive crop improvement on Mr. Cobbett's mode of proceeding the cutting in the ground. This is to be done than any now raised in the western counties of above detailed: "To obtain early cucumbers, we less reluctance, as, of all plants the cucumber is being in very high condition at that period. Tur that, with which it best agrees. To this end, there- nips are said to be injurious to ewes with lamb, fore, scoop as many large turnips as you propose but may be well given them after they have yean to have hills-fill these with good garden mould, ed. If your sheep, whether store sheep or ewes sow in each three or four seeds, and plunge them with lamb, have good hay, about a quart of potointo a hot bed. When the runners shew them- toes a day to each will, it is said, be very heneti selves, spare them, or pinch them, or bury them, cial, and an ample allowance. But when the on as you may think hest; * and on the 10th of May, ject is to fat them, according to a writer in Reetransfer them to the beds where they are to stand. Cyclopedia, about a gallon of potators a day with The advantage of the scooped turnip, as a seed a little hay, will be the proper quantity; but the bed, over pots or vases will now appear-for in- is dependent in part on the size of the animals. stead of the ordinary difficulty of separating the and in part on the quality and quantity of the had mass of earth and the plant from the pot which which is allowed them. To enable the reader the better to comprehend this passage, it may be well to quote the observations of the writer, in another part of the same article. "You have to choose between three methods of treating the plants, each of which has many and warm advocates. First, The permitting it to regulate itself with regard to the production, and the length of the steen. So coul, The pinching system, which by shortening the steen, compels it to push lateral branches Third, The plan of Rozier, which by burying the runner at short distances, avoids the hazard of pinching or cutting, and at the same time, obtains new roots from the buried joints. Of the three methods, the last has, in our opinion, the preference; but as others may come to a different conclusion, we will point out the time, the mode, and the effect of shortening the stem. Soon after the plant acquires a second rough leaf, you will discover about the foot of it, a bud, which left to itself would become a runner. This must be pinched off, taking care, however, not to wound the joint from which it proceeds. The effect of this pinching will be the prowhich it proceeds. The effect of this pinching will be the pro-duction of side shoots, which in their turn must also be pinched off, leaving only two eyes on each, destined to become future runners, and so to be conducted that they will not shade or crowd each other.'

MISCELLANIES.

FLOWERS.

Now let us range both far and wide, Through all the garden's boasted pride. Here Jasnupes spread the silver flow'r. To deck the wall or wave the bow'r'; The Woodbines mix in am rous play, And breathe their fragrant lives away. he rising Myrtles form a shade; There Roses blush and sent the glade; The Orange with a vernal face, Wears every rich autumnal grace; While the young blossoms here unfuld, There shines the fruit like pendant gold; Citrons their balmy sweets exhale, And triumph in the distant gale,

A PUN. ON MISS ANN BREAD.

While toasts their lovely graces spread, And fops around them flutter; I'll be content with Anne Bread, And won't have any But-her.

An Irishman of the name of M'Manus, who came over in one of the Belfast hoats, and who has been for some time suspected of trafficing in dead bod es by the loungers about the Bromielaw of training in term or say me mongers should be bronken. In a support of the property of the p about his middle, and he was swing round over the river, where he hung for a minute like the golden fleece, or Baillie Nicol Jarvie, at Aberfoil amidst the shouts of laughter of his tormentors, at the indescribal le queerness of the poor fellow's appearance. He was then rapidly lowered into the water and soused over head and ears. This ceremony was repeated five or six times, notwithstanding the pitcous appeals of the unfortunate resurrectionist, and the attempts of some humane by-standers to release him; which was not affected until the Police arrived, who conveyed him to the Office. M'Manus is the same individual who, about two weeks ago, was appreheuded in Gallowgate with the dead body of a child under his coat .- Glusgow Cour.

All men wish to be treated with respect; therefore treat all with respect, and you yourself will be respected.

Virtue is certainly the most noble and secure possession a human being can have. Beauty is worn out by time, or impaired by sickness-riches lead youth rather to destruction than to welfare, and without prudence are soon lavished away. While virtue alone, the only good that is ever durable, always remains with the person that has once cherished her. She is preferable both to wealth and a noble extraction.

BY DR. A. HUNTER.

Accustom yourself to reflect .- Seek wisdom, and you will be sure to find her-but if you do not look for her, she will not look for you.

Do as you would be done by .- Use yourself to kindness and compassion, and you may expect kindness and compassion in return.

Obstinacy is weakness .- Obstinacy of temper proceeds from pride-and, in general, from ignorant pride, that refuses to be taught.

True generosity is delicately rewarded .- Blame no man for what he cannot help. We must not expect of the dial to tell us the hour after the sun is set.

Cure for Intemperance .- It has recently been discovered, that sulphuric acid, taken in spirits.

Kindness in Sickness - Nothing can produce more sincere admiration and heart felt gratitude, sagacity, among which may be reckoned the one than the kind anxiety and assideous attentions of related in this paper last week in the story of an affectionate friend in sickness. Every tender effort to mitigate distress, accompanied by the informed, doubt the truth of that story. We cangentle and soft accents of sympathy and love, fills not, of course, from our own knowledge, attest to the soul with emotions not to be described, even its authenticity, though from the character of the while its fragile tenement is writhing with excru- writer alone, we can bardly doubt it; for he was ciating pain! The pleasure of alleviating distress not in the habit of stating things as facts withis so unalloyed, both to those who receive, the out satisfactory proof of their being substankind offices of endearing humanity and esteem, tially correct. We have within a short time had and to those who clieerfully and tenderly bestow several remarkable instances related to us, which them, that every person of a reflective and ingen. seem nearly as wonderful as that displayed by the uous mind, will cultivate this peerless virtue, by dog in the story above mentioned. Rev. Mr. practising those acts of goodness which are at. W——informs us that his father, living in Worsoul with the voice of tenderness.

From the American Advocate.

INSTINCT.

ed in the numerous dumb animals—and how near. Another instance is related by a gentleman living notwithstanding the boasted powers of man, does in this village, who informs us that he has no it approach to human reason! There are many doubt, from several experiments lately made by instances recorded, in which brute animals have him, that his dog fully understands considerable of exhibited such wonderful powers as to make it the conversation which takes place in the family, very difficult to find the dividing line between in- and that he knows, as well as his children, when stinct and what we call reason. We once wit- the Sabbath arrives, for on that day he never nessed such a display of this power in a duck, as attempts to follow him, which he invariably does convinced us that dumb animals are capable of other days. judging as to the effect to be produced by particular action, with as much, and even more correctness than could be expected from a child of For sale at the Seed Establishment at the New England Farmthe same age. The circumstance was as follows ? Being on a visit to the house of a friend, a number of ducks came near the door, a piece of dry hard bread was thrown to them. One of them. after trying for a considerable time, in vain, to masticate and swallow it, took it in her beak and carried it to a small pool of water, at a little distance from the door, into which she dropped it, and it soon became so soft, by the effect of the water, as to enable her to eat it without difficulty. Another remarkable instance of sagacity in birds, was related to us a few years since, by Rev. Dr. Harris, of Dorchester. The bird referred to, is of the Loxia species, and is a native of India. It constructs a pendulous nest in a very curious manner, of the grass which abounds in that country. It is suspended from a limb of a tree, in the form of a long narrow bag, and the entrance is from the bottom. The place for the deposite of are by far greater than at any other place in New England, orthe eggs is in a projection built in the side, about midway up. The reason of the bird's building in this way, is to preserve its eggs and young from the depredations of a small snake, in that country, which would destroy them. To take the eggs out of a nest constructed in this manner, the snake must first descend from the branch to which it is suspended, and when at the bottom, turn and go up. But the outside especially near the bottom, is so loosely put together, that when the snake attempts to do this, the outer filaments slip off and he falls to the ground, which is the case completely eradicates the inclination to use them as often as he makes the attempt. What is more intemperately. It is said to be preferable to Cham- wonderful, is, that when these birds migrate dur-

Numerous accounts have been given of canine "Captain Greg." Some of our readers, we are tended with a reward so sweet. He who would thington, owned a dog, that was particularly atwitness a performance of the holiest rites of "pure tached to him. He [Mr. W ----,] was engaged and undefiled religion," may behold them in the to teach a school at a distance of about five miles patient and gentle offices of affection-bending from his father's house; and usually returned over the bed of anguish-wetting the parched home on Saturday evening. On the second Satlips-cooling the feverish brow, and soothing the urday evening, the dog met him at about a mile from his father's house. This he continued thro' the winter, always meeting him at the same spot on Saturday, between seven and eight o'clock :--but never, as was ascertained by several members How wonderful is instinct, as we find it display- of the family, going that way at any other time.

EARLY CORN. &c.

For size at the Second Establishment at the New England Farmer Office, a few hundred Ears of the Early Golden Stoux Corn. This Corn was originally received from the Stoux tribe of Indians, and is considered by Mr Pruce, Mr Derby, and other gentlemen who have tried it, to be the most profitable sort that can be raised by farmers, from its great productiveness, and from its ripeaing so early, as always to ensure a crcp before the autumnal frosts set in. Mr. Prince usually has the new corn fit for grinding, by the first and second weeks in August. Cora is a bright vellow, the Ears being closely filled with from 12 to 16 rows

Also-The Early Jefferson Corn; a very early White sort, for the table-with the common kinds of early and late Sweet

Also, every variety of Garden Seeds for hot beds, &c .-- Winter Crook Neck Squash, Early Yellow Bush Squash, Early Scollop or Pattipan white Bush Squash, Warted Squash, Acorn

Squash, Valparaiso Squash, &c. &c.
Also a few pounds genuine Ruta Baga Seed.—This Seed was raised by T. Melville, jr. Esq. late President of the Berkshire Agricultural Society, and is from superior roots, received

sinte agricultura - sedery, and is from superior foods, received by him from Russia a few years since.

Likewise, Esculent Roots and Plants, Field and Grass SEEDS, Por and Sweet Here Seeds, MEDICINAL HERE Seeds, BIED Seeds, and more than 200 different kinds of Or-NAMENTAL FLOWER Seeds.

As the variety and quantity of Seeds kept at this Establishment Southern States, can always be executed with promptness, at satisfactory prices. Dealers in Seeds and Country Traders supplied, at wholesale or retail, on the best terms.

We have now on hand, of this year's growth, 200 lbs. Mangel Wurtzel & Sugar Beet, raised by J. Prince, Esq.

200 lbs. Onion Seed, Red, White and Yellow. 275 lbs. true Blood Beet, raised in Roxbury 250 lbs. Carrot, various kinds

220 lbs. Carrot, various sinus 250 lbs. Radis, superior quality 100 bushels Peas, early and late—[We have about 50 bushels of the Early Washington Fea, which was pronounced by the few who could obtain it last year—as our supply was small—the earliest and most productive of any brought into the Boston market.]

Tatalogues of the whole Establishment, with directions for cultivating the more rare and delicate seeds, comprising a pamphlet of 40 pages, furnished gratis.

NEW ENGLAND FARMER.

Published by John B. Russell, at No. 52 North Market Street, (over the Agricultural Warehouse) .- Thomas G. Fessenden, Editor.

VOL. VI.

BOSTON, FRIDAY, MARCH 21, 1828.

No. 25.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

HORSES.

SIR-In my first communication, for "relaxations of iuxury," read "emulations, &c." a very different thing; in the ninth paragraph, as it is printed, for "last observation," read "last observation in the last sentence;"for "different," read "unnatural;" for "caries of the bones ;-which are," read "caries of the bones of the foot: which appear to be;" there should have been no dashes; in my second communication, for "a superior bone," read "a superior horse;" for "more than any other horse, read "more than at any other age." I will now make a few remarks upon the treatment of a horse kept for his work.

1. As to whether he should ever be turned out. It was once the received opinion of English sportsmen, that he should be periodically brought back shelter from the weather. Hunters, consequently, excepting those of a few sagacious individuals, were regularly turned to grass to shift for themselves in the aummer. This system has been, of late years, attacked by a very powerful and classical writer, who asserts, that as to perform the work of an English hunter, the horse's strength must be vastly increased upon nature by a long uninterrupted course of high keep in the stable, exertions does not require, he says, can be takchanges to cold, and he is changing his coat! If talking behind him.

Vegetius, who wrote in the reign of Valentinian, tion. Oats are the least dangerous corn, they bewhen the whole world was interested in horse flesh, and who calls turning horses out at all sea sons a Bunnish practice. He wrote for the climates of Syria and Spain. The benefit to a horse of regular work and nourishing food increases his powers for years in succession. He appears to some degree, prepared for; and his ability to grow thicker. A particular kind of herae, who, make it, should be looked for, from the previous to use such an expression, carries his work in his legs and his carcass, and not in any original goodness of his own, a stage-coach proprietor must frequently notice this fact in; and he is the most valuable horse he can get. I mean a horse, naturally of moderate powers of performance for and hollowness between the hip joint and the a single day, but who has a deep carcass, with an stuffe joint, in worked horses that get nothing betinsensible foot and consequently has open to him ter than oats, which is not to be seen in those that a chance of receiving the highest degree of improvement to be derived from a succession of years of strong food and strong exercise.

2. As to how he should be confined in the stato what some people considered his natural state, ble. The universal practice in Massachusetts, as turned out to grass, deprived of his corn and his in most other places, is to tie him in a narrow stall with his fore feet higher than his hind ones. In some stables the declivity is very considerable. It is my opinion, that if there must be a declivity, it should be forwards A herse worked every day on a fast trot over a hard road, as a coach horse, suffers enough in his fore feet when he is mon practice in Massachusetts to water horses sound. One of the first signs of incipient disease just before they leave their stable. This is ridiin them, or rather of the crowded state which precedes disease, is his throwing his weight as much to turn him out, is not only to expose him to ruin as he can on his hind legs. I am inclined to doubt unquestionably may become accustomed to it, as from taking cold, but to throw away all his ac the fact of his preferring to stand up hill under to any thing clse; but it injures many of them. quired strength. The continued summer test of such circumstances. One reason for such an opin If driven on again immediately, and thrown into a hunter, which a horse not exposed to the same ion is the manner in which his weight is thrown new perspiration, it may possibly prevent the waon his toes when he stands up hill, even if his ter from injuring them; but I entirely question on in a small inclosure at home, the dampness of heels are raised. Another great disadvantage of the fact of its lessening the fatiguing effects of the earth can be supplied by standing in wet his standing so is that he throws the whole weight their work. I know that it is hard to tire a peclay, some hours every day, and the grass, if he of his forehand upon the same muscles and ten- destrian that will drink but little; and that if he must have it, can be put into his crib. The ultra dons he uses most in draught. It is certainly of is to walk all day, every tumbler of water, drunk stabulist has completely triumphed, and convinced importance, that if he must have an unnatural when hot takes two or three miles from a pedesthe English nation, that where a horse is kept ten strain any where when he is not at work, it should trian's day's work. It is also a common practice months of the year in a heated atmosphere, to not be where the strain must be where he is. It to drive horses through a stream of water when sleep upon the dam ground, in a variable climate, is a vast comfort to a horse to be kept in a box. they are hot, to refresh them The immediate efthe remaining two, can do him no good whatever. He should be able to choose his own position at fect, unquestionably, is to refresh them; but they In our cities, when a horse gets weak or lame, least to sleep in, and relieve what muscles he soon feel an increased stiffness from it. It is the who is used to a hot, dry stable, perhaps to being wishes to. In a stall, he must sleep, through life practice of some people to tie them up after they clothed, with a plethorick system begging for di- with his head held in the air, and his legs under seases of the lungs and throat, incalculably less his body. His getting cast in a box is not a comaccustomed to the night air than the generality of mon occurrence. Ten feet square will do well; men, he is sent into the country to be turned out; if he cannot have a larger one. In a hox he is particularly in the autumn, when the weather first freed from the torment of hearing walking and

any person will go into a large livery stable in 3. As to how he should be fed. I have never Boston in May, before the windows are taken out yet met with a person having the charge of hors for the summer, when the doors are opened at es, who in my opinion attached sufficient impordaybreak, he will find, that though he cannot re-tance to the impropriety of allowing a horse his main an instant in it himself, the horses have been usual allowance of corn when suffering from cold. from the air, that they are most of them in good of the windpipe, a disease for which we have here health, and some in high condition. After the no name, many that are brokenwinded, many that certainly has a much more coachmanlike appearefforts nature must have made to bear this, will are runned in their feet, may have it ascribed to she instantly retrace her steps? That she will, is being fed on severe colds. The corn increases defended and acted upon by persons who think the disorder of the system by the difficulty with be able to trot over a fair roadhis ten miles in the

I would quote, if I had the book, the words of gerates what tendency may exist to local inflamaing here so very light. There is another remark, which I would make, which is, that no horse should be fed higher than usual, when forced to any accidental violent exertion. He never ought to be forced to any, which he has not been, in preparation, not from any unusual means of aupporting his atrength. Oats appear to be the corn best suited to a horse's stomach; but he wants something better than ours for full work. There is to an experienced eye, a particular lightness get Indian corn. As I observed in my last communication, there is a great difference, generally, in the constitution of the round-chested, and the deep and narrow horse. The first has a much more comfortable one to deal with; the other is often stronger, faster and better winded; but varies infinitely from day to day; feels the seasons more; is not so good a feeder; nor ought he to be; for his stomach is weaker and more readily oppress-

4. As to how he should be worked. It is a comculor : Let a worse practice is to water them during their stage; which last is universal. They come in, in the strongest draught of air which can be found, (a damp brick yard where the sun never shines is still better), and wash their legs with cold water. This is going for the whole. The universal manner in which coach borses are driven in Massachusetts is reprehensible. They are started off at a pace much faster than they are expected to hold, and continually galloped for short distances, when the pace at which they are expected to perform their stage does not exceed six or seeen miles in the hour. I do not believe quietly sleeping sometimes two in a stall, their own Not only is the corn thrown away, but it must al- that occasional galloping relieves the horses in breath and effluvia chiefly confined to their con- ways do him some harm, and may do him a great slow coaches, where the hills do not render it tracted stalls, their postrils the farthest possible deal. Many horses that suffer from a thickening necessary. I believe they should always be driven as nearly as possible at the same pace; and it ance.

No horse is worth breeding now, that will not they understand horse-flesh. To such persons, which it is digested, and when digested, it exag bour, with ease to himself; and to do this he

question of foot lameness. I should be very hapinformation affoat, which the public never gets the lame in the near foot than the off onc. It is my as well for fruit this spring as last. firm belief that there are, and there is a plausible reason for such an opinion I have subjoined the pedigree of the two most distinguished stallions of the Northern States. I would here remark upon the corrupt use of the word stud. A stud means in English a collection of horses. Stud-horse may do well enough; but when the language contains an old established term such as stallion, which perfectly expresses the idea of a horse kept for the purpose of continuing his species, there is no necessity for our manufacturing a new one.

Eclipse, a light chesnut horse, foaled in 1814; bred in Long Island; got by Duroc; dam by Messenger out of the English Pot8o's mare .-Duroc, was a Virginian horse, by English Diomed; dam a celebrated Virginian mare, but I do not know the pedigrees of the horses whose names are contained in her pedigree. Messenger was an English horse of the first blood; and proved in the States a most successful stallion. Pot8o's mare's dam was by Gimerack; but I do not know the rest of her pedigree. Pot8o's and Gimcrack are amongst the most celebrated names of English horses.

Henry, a dark chesnut horse, foaled in 1819; bred on the borders of Virginia and North Carolina; got by Sir Archie; dam by English Diomed; his grandam's pedigree is Virginian for several generations, but I know nothing of the horses contained in it but their names. Sir Archie is supposed to have been got by Diomed himself; his dam an English mare, bred by Lord Egremont, got by Rockingham out of a Trentham mare. It is impossible for any English pedigree to be higher than Sir Archie's; and he has consequently proved the most successful stallion ever bred in the States.

FOR THE NEW ENGLAND FARMER.

DESTROYING BUGS IN PLUM TREES.

Take of tobacco juice one gallon, this may be had of the tobacconists, or you may make it by putting some tobacco in warm water, (not boiling, as that will take off a great part of the oil.) Oil of tar, one quart-train oil one quart-soft soap one and a half pounds, and a quarter of a pound of soot. Beat the oils together first, and then the soap and soot, till well united, then pour them all into the tobacco juice, stiring them gently together. When the liquid is cold, it is fit for use. It should be applied with a common paint brush, in the latter end of March or the first of April.

Previous to applying the mixture, I should recommend pruning; and when the trees are very much affected with the abovementioned disease; heading down at a, b, e, d, e, or f, according to the size of the trees: if any of the ulcers should remain after pruning or heading down, they must be entirely removed from the tree and then apply the composition.

In the month of March, 1825, the plum trees of the late Hon. C. Gore, of Waltham, were affected, at the end of six weeks it was very trifling.

must have much and good blood. At some future with this disease, and which I treated in the above opportunity I will make a few remarks upon the manner. They were so much affected, that I was it appears, that when boiled with liquid caustic obliged to head down two of them during the sumpy if any one else would give the result of his mer of 1826. These trees have since made very experience upon it, as there is a vast deal of such luxuriant wood, and free from any of those bunches they have heretofore been subject to. In the good of. I would ask any coach proprietor, most summer and autumn of 1827, I had the pleasure potash, and this may be precipitated from it by an of whom have much experience of this kind forced of picking as good a crop of fruit (in quantity) from acid. That part of the wax which rises to the upon them, if he has observed more horses to be these trees as I have ever seen; and they promise surface, is converted into a saponaceous matter;

R. TOOHEY, Gardener. Waltham, March 1828.

[From the Domestic Encyclopedia.]

MYRICA - Candle berry Myrtle. This is a genus of plants comprehending the

following native species:

I. M Cerifera. This g own upon boggy lands in the southern States, rising with many strong shrubby stalks to the height of six or eight feetthe leaves are stiff and spear-shaped, of a yellowish lucid green on their upper surface, but paler underneath; of a grateful odour when bruised .-The catkins come out on different plants from the berries, and are about an inch long, and erect .-The female flowers come out on the sides of the John H. Powel, branches in long hunches, and are succeeded by small roundish berries covered with a mealy substance, and afford a green wax by hoiling.

tle; a variety of the former; bark gray, leaves shorter and broader, and more serrated.

3. M. Gale, bog gale; also grows in swamps, to the height of two or three feet; leaves lace- New York, I stopped at Elizabethtown, New Jershaped, smooth, and a little sawed towards the scy, where I saw a machine propelled by a small points. The borries are dry, compressed at the steam engine, at work preparing the raw flax apex, and three lobed. This species grows in N. Jersey, but abounds in the eastern States, and in Nova Scotia, according to Mr. Bartram.

by Judge Bee, is inserted in a little pamphlet, pub lished in the year 1788, by the Agricultural Sociwere put into a sixty gallon cask, which was filled with water. In forty-eight hours, the ley was strong enough to bear an egg; it was then drawn five gallons; four pounds of myrtle wax were adsteady fire, from nine o'clock in the morning, till three in the afternoon. For the first three or four then weaker ley was poured in occasionally, and crop. the whole frequently well stirred. After six hours boiling, two quarts of common coarse salt were thrown into the kettle, which was left one hour more to simmer over a slow fire. The liquor was then put into two large tubs to cool, where it continued twenty four hours; and then the soap was taken out, wiped clean, and put to dry. The next day it was weighed, and the produce was forty pounds, and two ounces, of solid soap. The loss

From Dr. Bostock's experiments on myrtle wax, potash, the fluid becomes tubid; but, after some time, the greatest part of the wax rises to the surface, nearly without color, in a floculent form. A small quantity of it only remains dissolved in the it has lost its inflammability and fusibility, and forms an opaque solution with water. From this solution, it is precipitated by an acid in the form of white flakes, which, when collected resemble very nearly the wax before its union with the potash. In the Medical Repository, of New York, it is stated, that Dr. Joseph Browne, of that city, had discovered a cheap and easy process for bleaching myrtle wax, but it has not yet been published .-No doubt, however, the coloring matter may be destroyed by the process for bleaching common bees-wax; or by the vapor of alkalis, which, according to Chaptal, destroys the green color of al! vegetable matter.

MACHINE TO BREAK FLAX.

November 25th, 1827.

Corresponding Secretary of the Pennsylva-

nia Agricultural Society.

Well aware, from experience, of the difficulty 2. M. Cerifera hun ilis, dwarf candle berry myr- attendant on the process of preparing flax in the usual way, I was much gratified to find, that, at length, a machine has been invented that appears to obviate all the difficulty. On a recent visit to without any rotting or previous process. A French gentleman of the name of Frederick Roumage, engaged the farmers last spring, in that neighbor-The wax is obtained in S Carolina and Geor- hood to raise flax, for which he promised to pay gia, by boiling the berries of the M. cerifera in \$15 per ton, as gathered from the field, after havwater, and skimming it. Mixed with tallow, it ing the seed beat out of it. In consequence of forms excellent candles: a soap may be also made this encouragement, he has now the produce of from it. The following receipt for the purpose, about 400 acres. So well satisfied is he with the machine, that he does not intend either to show or to patent it. All you see is the rough flax put ety of Charleston, S. C. To three bushels and a on an endless canvass cloth-enter one side, and half of common wood ashes, was added half a bush- in a short time emerge on the other, with the el of unslacked lime; these, being well mixed, woody fibre as completely separated from it, as is usually done by the best process of breaking, after the flax has been rotted. The fibre in this state has a yellow coloring matter in it, that in a few off, and from six to eight gallons of it put into a days may be so completely washed away, that it copper kettle, capable of containing about twenty- becomes as white as paper, and almost as soft as silk, a sample of which I enclose with his printed ded, and the kettle kept boiling over a constant directions to the farmers for the cultivation of the plant. EXPERIMENTS ON SEA COAL AS A MANURE.

BY THOMAS EWELL.

In the proposals I have issued, for the publication of a new work on chemistry, to be adapted for the use of the public in general, it is stated, that I would relate some experiments, instituted to throw light on the art of enriching impoverished lands. The result of several of these has so far exceeded my sanguine expectations, that I hasten to publish them; hoping to turn the attention of farmers to a subject by which their interests may be incalculably promoted.

From a train of reasonings, I was led to believe, that the common sea, pit, or mineral coal, which pulverized, might prove a useful manure. To as- \$1.25 per bunch.

of indirect bounty by the fostering cure of the certain the truth of this, I made the following ex-

> Cement for Boilers -It is stated by a correspondent in the London Mechanics' Magazine, that a cement of lune, (made from oyster shells,) and worked into a paste with the white of an egg, and used upon a cracked boiler ten years ago, which has been in constant use ever since, is now as firm as when first put on. It effectually stops the escape of gas through any aperture, when no other cement could be made to rest. The lime must be fresh and unslacked, and the cement applied as soon as mive!, otherwise it becomes solid. It will resist the united action of fire and water; and even the concentrated acids are stated to have little or no effect on it .- Pen. Gaz.

Silk .- One farmer in Connecticut, estimates, been made are not as generally known as they shall have come to maturity, that the females of should be. It may be owing to this cause-for his family will annually make 300 lbs. of Silk .example, that an ounce of sulphuric acid is not They made 50 lbs. last year, by about 100,000 added to every cart load of manure; which has worms, without reeling any loss of labour. Silk long since been found, in England, to render it will be extensively produced in the United States, especially in the South .- . Amer. Farmer.

> Sun Flower .- In Portugal, they eat the young shoots of this plant, "sensoned with oil and salt; bread is made of the seeds, and also a sort of groats, that a useful & edible oil may be expressed from them, and that they are good for fattening poultry. The leaves of the plant form an excellent forage, especially for cows and sheep .-The stems will do for props for twining or climbing plants; afterwards they will make good fuel, coffee." - Gardener's Magazine.

SCIENTIFIC AGRICULTURE.

An Address delivered before the Hampshire, Franklin, and Hampden Agricultural Society; at Northampton, Oct. 24, 1827. By EDWARD HITCHCOCK, Professor of Chemistry and Natural History in Amherst College.

[Continued from page 267.]

Concerning the state of agriculture in Great Britain, previous to the fifteenth century, we know but little. We may conclude, however, that when men begin to write books on any subject, an interest in it is excited in the community; and as early as 1534, Anthony Fitzherbert produced a philosophical and ingenious treatise upon agriculture. But in the succeeding hundred years, nothing appeared on the subject, worthy of notice .-Indeed, though rural economy, sometimes waxing and sometimes waning, was upon the whole slowturies.

But a still more powerful obstruction to the progress of agriculture, was an almost entire ig. tion of the enlightened agriculturist, is to ascer- best mode of supplying those that are wanting. norance of the scientific principles on which it is tain the nature and situation of those minute vesmade such rapid progress.

I know, indeed, that there is a prejudice existing in some minds, against the application of sciedge of the composition of soils, of the food of that needs nourishment; even to the very roots nually formed in every plant. plants, and of the mode in which that food is con- from which it proceeded. These vessels corresverted into nourishment, will not this knowledge prove an important auxiliary to experience? The plants, corresponding, probably, to those similarly tute the great mass of our globe. Now it is a well experience of one man teaches him it is important he should observe the position of the moon, or whether the day of the week be lucky, or unlucky, when he sows and when he reaps. But science tells him, that these, and a hundred other inscrutable-modifying and controlling every op- ture of the rock beneath it. For instance, the soil similar observances, are not only uscless, but of eration and keeping the wonderful machinery in along the Connecticut is in many places, of a redten defeat his experiments. On Rape-its cultivation and produce in Seed-Its value as Green Food for Neat Cattle and

BY JOHN HARE POWEL, Esq.

Powelton, Philadelphia country, 1827. DEAR SIE,-In accordance with your request, The fourth and last class of rocks, or soils, is I have prepared a notice on the cultivation, uses,

I am not aware that rape had been cultivated extensively in any part of the United States, until productive of all soils; and our own Cennecticut 1824, when Mr. Miller and Mr. Phillips of this and its tributaries, particularly the Deerfield, the county, obtained crops so extraordinary in product and value, as to induce them to recommend it to the notice of their neighbours, by the only sort of evidence, which operative farmers will receive.

> I have no knowledge of its cultivation, except from my observations abroad. It is highly valued in many parts of Europe, as well for its product which it affords throughout the greater part of the year.

> It may be sown either broadcast, or as turnips, in drills-or, in beds, and be transplanted as oth-The usual and most successful mode, is to sow from two to three quarts of seeds broadcast in June or July, when intended for green food, but in August or September, when destined to pro-

The process of transplanting is too expensive time in blossom .- ibid.

It produces in ordinary seasons on rich alluvial, or other deep friable soils, from 40 to sevenand precision are necessary in harvesting the seeds in June or July, of the ear succeeding that in which they are sown. When the pod, asregularly in handsful or grips in rows, where it continues until the straw becomes comewhat white-the seeds of the colour of which we find them in the shops. If they be allowed to become too dry, they fail out on the slightest motionwhen carried too green, they are liable to be heated. At the proper time they must be thrushed in the field upon oll sails or cloths, to which the crop should be carried upon sledges prepared with

or on barn floors, and be occasionally moved. Sheep and nest cattle are extravagantiv fond of it-but of all plants, perhaps it is the most likely te cause them to be blown.

carefully spread in small quantities in granaries

There is much difference of opinion as to its nutritive properties in the green state. I believe, that it quite equals the common cabbage, and very far exceeds turnips of all kinds in the quantity of nutrition it contains-in the value of the oil for various manufacturing purposes, and the excellence of the cake, after it has been expressed, for cattle feed and the manure of drill crops, no question can be entertained.

It is not a certain crop-as it is exposed to all the enemies which attack turnips and cabbagesand is liable to be injured at the season of blossoming by mildew and sometimes by frost.

The Season .- The extraordinary mildness of the present season, is the common topic of conversation. Our gardens and shrubberies have assumed the appearance of spring. The prevalent range of the thermemeter has been from 58 to 68. occasionally it reached 70: Green peas, asparagus, tomatoes, with other spring vegetables, have been in our market the whole of the past month. A friend informs us that he saw growing in a gentleman's garden in the city, many Tobacco plants, thrifty and in full bloom, which had sprung up since November, from roots of old plants; also in seeds, as for the large quantity of green food Green Corn, fully fit for the table, grown from last year's seed - Southern Agriculturist, for February, 1823.

> Among the peculiarities of the season, says the Macen Telegraph, of the 31st Dec. may be menioned the appearance of a load of water-melons in our market on Christmas day! They were brought, we understand, from Twiggs county, and sold at a good price. In the garden of Dr. Bird. of this town, Strawberry rines have been for some

Every Family to make their own Sweet Oil .- It is reported a person is going to take out a patent for making a small hand mill, for every person to make their own sweet oil. This may easily be done, by grinding or beating the seeds of white poppies into a paste, then boil it in water, and skim off the oil as it rises; one bushel of seed weighs 50 pounds, and will produce two gallons of oil .--Of the sweet olive oil sold, half of it is oil of poppies. The poppies will grow in any garden; it is the large-head white poppy, sold by apothecaries. Large fields are sown with poppies in France and Flanders, for the purpose of expressing oil from their seed, for food. When the seed is taken out, the poppy head is boiled to an ex tract (see New Dispensatory), which is sold at half a dollar per ounce, and is, in some respects, to be preferred to opium, which now sells very high .-Large profits may be acquired by the cultivation of poppies. Some acres of it are now sown near Cambridge.

[I have used during the summer of 1819 nothing but the oil of the bene seed, procured from South Carolina and Georgia. This oil may be obtained in quantities so large, as to be employed profitably in making soap. For salads, I aver from my own experience, that the bene oil furnished to me by Dr. Mease of Philadelphia, is fully equal to olive oil; and may certainly be afforded at less than a dollar for a gallon. I say the same also of the poppy oil made at the former Muravian settlement at Harmony near Pittsburgh. I have tried a bottle of it, and find it no way inferi r to olive oil for any purpose. Half the salad oil used in Paris at this moment, is poppy oil .-T C.]-Domestic Encyclopedia.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MARCH 21, 1828.

HOW TO RAISE MELONS.

The following method of raising early melons is given in a "Treatise on Gardening," by J. Armstrong, of Dutchess county, N. Y. Select a spot tained .- N Y. Albion. well defended against the north wind, and open to the sun throughout the day. If such is not to be found in your garden, create a temporary and artificial shel'er producing the same effect. At the end of March, form holes two feet in diameter, and distant from each other seven feet and a half. Fill these with horse dung and litter, or a mixture of mould, dung, and sand. At the end of twenty days, cover the holes, which have been thus filled. with hand glasses. When the heat rises to 36 of Renumer, [113 Fahrenheit] sow the seeds four inches apart; and when the plants have acquired two or three leaves, pinch off the end of the branch or runner. This will produce lateral branches which must again be pinched off, so soon as they respectively attain the length of ten inches .-When the plant has out-grown the glass, the latter becomes useless, and may be removed-but should the weather be wet or chilly, substitute coverings of clean straw for that of glasses, until the young plant becomes strong enough to bear the open air. Two or three melops only, are left will not ripen together."

runners of melon vines, namely: "If the banches next day forwarded to New York, which it would be vigorous and long, stretch them carefully over probably reach in about thirty days, thus afforda level surface, and bury every fourth or fifth ing president Adama an opportunity of perusing joint. This is best done by means of a wooden his own speech in the Sun paper, after having crotchet. Virginia Pumpkin .- A pumpkin of unusual size, grew on the farm of John Reynolds, Esq. a few miles from Clarksburgh, Va. last season. It weighed 320 pounds, and measured round the middle 9 feet. All that grew on the same vine weighed 840 lbs.

of Directors announce the rapid progress of this great public work. It appears that the whole line ized the most sanguine expectations of those who from the Niagara and Welland rivers will be fin- planned it. But it is equally true, that it is closed ished by October next, when the communication at least four months in the year; and the legislabetween Lakes Erie and Ontario, around the Falls ture might as well pass a law that it should not of Niagara, will be completed. The importance of this undertaking will be seen, when it is stated ing that the canal should be closed only from Dethat the canal is of sufficient magnitude to be navi- cember to March. When it rains, we must even produce will soon be sent by the ordinary lake freezes, we must let it freeze. Without attemptfrom Albany purposes, a Sea Coast of greater extent than the away from us. Massachusetts has lost none of her pears that 50,0001 is required to complete the cairail road from Boston to Albany, which will make amount; which, there can be no doubt will be ob- ly as cheap, it will at once prevent this city from

fair friends as well as those who wish to "stand will unquestionably enable the capitalists of Boshigh in their good graces" on the score of cleanliton to compete with our merchants for the whole ness, to publish the following receipt for making trade of the west. For they will then meet us on a cheap and incomparably excellent dentifrice, equal terms at Albany with for ign goods importwhich not only makes the teeth white, but also ed into Boston, and transported on the rail road, gives strength to the gums and an agreeable sweet- and for further transportation the canal is as free n as to the breath -It is as follows:- Take half to them as to us." an ounce of Gum Myrrh, one ounce of Chalk, and one ounce of Charcoal. The ingredients must be finely pulverized and sifted through a fine seive, when it is fit for immediate use .- Am. Advocate.

culated at the present day, we may instan the and the company sit down to play.

RAIL ROADS.

We find in the last New-York Journal of Commerce, the following remarks on a subject in which, we hope our fellow-citizens are deeply interested:

RAIL ROAD TO THE WEST.

" The plan of a rail road from the city of New-York to the waters of Lake Erie, which has been suggested to the public, appears to me worthy of attentive consideration. It is true that the Clin-Welland Canal .- The last Report of the Board ton Canal (I know that I shall be understood, and I wish the name might always be given; has realrain, as the one which was lately proposed, declargated by vessels of 125 tona burthen, and that do as they do in Spain—let it rain; and when it craft, from all the upper lakes to Prescot. 130 ing to resist the ordinances of nature, we must miles from Montreal, and to Oswero, 186 miles prudently accommodate ourselves to them, and The lockage, or fall from Prescot making the best use we can of the canal in the to tide water, on the St. I awrence, is only 196 ft. warm season, we must contrive some other mode and a canal of only 30 or 40 miles in length is re- of transportation for the cold. I say we must; quired to connect the Lakes with the Ocean; for with all the wonderful advantages of our local which, if on the same scale as the Welland, would situation and acquired facilities, the neighboring render the Lake Navigation, to all intents and states and cities are on the alert to take them whole Atlantic Coast of North America. It ap- wealth or enterprize. She will soon construct a nal, and that Mr. Merritt, the Agent of the Com- the transportation of goods much cheaper between pany, is on his way to England with an applica- those two places, than by the present circuitous tion to the British Government for a loan to this route, through New-York city. If it be made onbeing any longer the entrepot of the trade between Boston and the west, of which I00,000 bbls. Tooth Powder.-It may be gratifying to our of flour annually form one item. Still more, it

Nothing is more delightful than an evening party in a private German circle. You assemble for this occasion immediately after tea, which is regularly taken at six o'clock. Some refreshments, Singular Expedimon across the Atlantic, -As a such as pine-apples, grapes, &c. are handed round. proof of the great celerity with which news is cir- The whist, quadrille, or ombre tables are arranged, following: - The American President's Speech; play, a band performs tunes of Mozart's, Weber's, delivered at Washington, left New York in the and Rozini's operas; and if there are daughters packet ship Sitas Richards, on the 11th Decem- in the family, whom their friends are coming to ber, arrived in Liverpool on Monday the 31st, was see, a dance is arranged before you are aware.despatched, by express, to London at three o'cl'k. There is in every house not only the music maswhere it reached at three o'clock on Tuesday; ter, but nt least two or three servants who are exto each vine, and under each of these is placed a was printed and published by five o'clock the cellent performers. Their rooms not being carslate, without which the upper and under sides same evening, in a second edition of the "Sun" peted, but parquetted and polished with wax, are Evening Paper, occupying nearly five columns, at any time ready for this occasion. It is in these In another passage of the same work, the writer closely printed, and left London that night by all evening parties that the amiable and fascinating gives the following method of superseding the net the mails at eight o'clock, arrived again in Liver, character of the high classes of the Austrian emcessity of pinching off the ends of the branches or pool on Wednesday at seven copies of which were pire shines out in all its charms .- Austria us it is.

Cure for sprains or bruises .- Take two ounces of cast-steel soap, half pint alcohol or spirits of wine, mix them together, then add half pint beef gall; put it into a bottle and stop it tight. The older it is the better Bathe the parts affected with it and you will find immediate relief.

THAMES TUNNEL.

This prodigious undertaking, notwithstanding the serious casualties which have interrupted its progress, is still to be prosecuted with vigour .-Since the irruption of Jan. 12, which was less considerable than the former breach, the cavity has been filled, and the water principally re-drawn from the tunnel. About 700 feet remain to be excavated-rather more than half the whole distance across the river. The company's funds are reduced to £21,000; and contributions are so licited from the public in further aid of this grand sub-marine turnpike. The younger Mr. Brunel, one of the superintendants, parrowly escaped the fate of the six workmen drowned by the last sudden incursion .- Eve. Bulletin.

INDIAN CURE FOR THE EAR ACHE.

Take a piece of the lean of mutton, about the size of a large walnut; put it into the fire and burn it for some time, till it becomes almost reduced into a cinder; then put it into a piece of clean rag, and squeeze it until some moisture is expressed, which must be dropped into the ear as hot as the patient can bear it.

An apricot tree in the rear of Pine-street, New York, has already shed part of its blossoms, and the fruit has begue to form.

Post Office.-We understand there were upwards of 8,000 letters assorted and mailed at our Post Office yesterday-an instance of despatch seldom equalled. During the two last days, upwards of 11,000 were mailed .- N. Y. Statesman.

Large Cow .- A cow four years old, of extraordinary size, was slaughtered in Hallowell, Me. a few weeks since. She weighed 9001 pounds, and had 71 pounds of tallow. She was raised by Charles Vaughan, Esq. and was one of a breed imported by him in 1792.

IT An article from an esteemed friend in Cambridge, on the Cultivation and Forcing of Sea Kail, came too late for this paper .- An article on the Propagation of Salt Water Fish in fresh water, and the progress of the experiments made in Scotland, will soon appear.

40,000.

March 11-

Russian Flax Seed.

For sale at the Seed Extablement, connected with the office of the New England Farmer, No. 52 North Market Street, Boston-a tew busilest genuine RUSSIAN FLAX SEED imported direct from Riga, by Charles Thorndake, Evq. of this City. This is the sort of Flax that was introduced a few years surce, by Col. Perkins, from Russia, and which is now extensively epithesized to Beited geomy in this States—and is found for sively cultivated in Bristol county in this State-and is found far superior to the common Flax.

The following is an extract from Col. Perkins' letter, to the corresponding Secretary of the Massachusetts Agricultural Soci-

ety, accompanying a cask of the seed.

"When in Ireland last summer, I conversed with some of the "When in Ireland has summer, I conversed with some of the venders of Flax Seed, from whom I learn that the growers of flax preterred the seed from Riga, to that of any other country, after that the seed from Holland, and last of all the seed from the United States; of this, the seed from the State of New York had the preference. Upon inquiry, I found the Dutch seed was preferred, from being more clear of tares than ours, and the in-spection was more attended to in the State of New York, than in Massachusetts. The whole importation into Ireland, was 54,656 casks, of which 51,354 came from the United States 10,822 from Holland, and 2000 from Riga. The Riga seed 10,882 from Holland, and 2000 from Riga. The Riga seed commands in ordinary seasons. 20 to 30s, sterling more than the Dutch seed, and the latter 10 to 15s, more than ours. An exconten seco, and me nater 10 to 1.95, more than ones. An experiment had been made of sowing in the autumn, in place of the spring as had been usual. On the 6th of July I saw flax at Beats, (which had been sown in October four feet and an inch in length. This, I understood, was from Riga seed."

year, which gave universal satisfactions, as to december the mess, and good quality.

Also, see not the Cuba Tobacco, Yellow Tobacco, Teazel, Lentils, Spring Wheat, Spring Rye, Barley, Rape, Broom Corn, Spring Vetches, Castor Oil Bean, Corn, (various sorts)—Weld, Yellow Locust, White Mulberry, Millet, Burnet, Orchard Grass, Rye Grass, Tall teadow Oats Grass, White and Red Clover, Mangel Wurtzel, &c.

Just received from Europe, 1000 pounds of fresh Lucerne

Fruit and Ornamental Trees.

The KENRICK NURSERIES in Newton, near Brighton, are the most extensive in New England.

Brighton, are the most extensive in New England.
Gendlemen in want of Trees, are invited to callexamine for themselves—and, make their own selections. The Apple and Peach Trees are extra
ordinary for size, variety, and thrifting.

MISCELLANIES.

ON PLANTING A TULIP ROOT.

Here hes a bulb, the child of earth, Buried alive beneath the clod, Ere long to spring, by second hirth, A new and nobler work of God.

Tis said that microscopic power Might thre' its swaddling folds descry The infant image of the flower, Too exquisite to meet the eye.

This, vernal suns and rains will swell. Till from its dark abode it peep, Like Voons rising from her shell, Amidst the spring-tide of the deep.

Two shapely leaves will first unfold, Then, on a smooth elastic stem. The verdant bud shall turn to gold, And oven in a diadem.

Not one of Flora's brilliant race A form more perfect can display; Art could not feign more simple grace, Nor nature take a bue away.

Yet, rich as morn of many a hue, When flushing clouds thro' darkness strike, The tulip's petals shine in dew, All beautiful-but none alike.

Kings, on their bridal, might unrobe, To lay their glories at its foot; And queens, their sceptre, crown, and globe, Exchange for blossom, stalk, and root

Here could I stand and moralize; Lady. I leave that part to thee, Be thy next birth in Paradise, Thy life to come, eternity.

Acquaintance table,-The following clever statistics we find in an old Magazine of many years' antiquity, but the numerical statements apply as well now as then:

Receipt for a rout .- Take all the ladies and gentlemen you can collect-put them into a room with a slow fire-stew them well-having ready twelve packs of cards-a piano forte-a handful of prints or drawings, and put them in, from time to time. As the mixture thickens, sweeten with politesse, and season with wit, if you have any, if not, flattery will do, and is very cheap. When all have stewed well for an hour, add some ices, jellies, cakes, lemonade, and wines ;-the more of these ingredients you put in, the more substantial will your rout be. Fill your room quite full and let the scum run off!

A grammatical pupil .- A country school master in the neighborhood of Cucdney, the other day, to speak to him, and at the same time promised to curred in Europe. repeat the dose if he spoke to him ungrammatihad got, determined to be exact, and thus addressed his fellow pupil: "There is a common substantive of the masculine gender, singular number,

A landlord threatened a poor Irishman, the other day, to put a distress in his house, if he did not pay his rent. "Put a distress in, is it you mane?" said Pat ;- "Och, by St. Anthony's sow, but you'd better take distress out-there's too much in already, by the mither that bore me!"

Compliment to Boston .- The Southern Review, in an elegant article on classical learning, thus alludes to the literature of the North. "These improvements, with so many more, are beginning to spring up and blossom, with great freshness and luxuriance, about the favored city of Boston, our western Florence, in which industry has been the willing tributary of letters and the arts, and which is, throughout all its institutions, its character, and its pursuits, one great monument of what commerce has done to civilize and adorn life."

The celebrated engineer, J. M. Brumel, superintendant of the Tunnel under the Thames, at London, is a native of the United States, and was the inventor of the block machinery at the dockyards, Portsmouth.

Large Fruit .- The editor of the Detroit Gaz ette in speaking of the fertility of that territory says, that during the last month, he has seen several water-melons, each of which weighed npwards of forty pounds-and that it is not extraor dinary to see a beet which will weigh more than eighteen pounds. The following are given as the weight and dimensions of a pear picked in a gar den at Detroit. Weight 30 ounces; longitudinal circumference 171 inches; longitudinal diameter 71 inches; circumference 141 inches.

TO MAKE A MARROW PUODING.

Take a quart of cream and milk, and a quarter of a pound of Naples biscuit, put them on the fire in a stew-pan, and boil them up : take the yolks of eight eggs, the whites of four beat very fine, a little soft sugar, some marrow chopped, a small glass of brandy and sack, a little orange-flower water; mix all well together, and put them on the fire; keep stirring till it is thick, and put it away to get cold; have a dish rimmed with puffpaste, put the above in, sprinkle currents that have been well washed in cold water, and rubbed clean in a cloth, marrow cut in slices, and some candied lemon, orange and citron, cut in shreds, and send it to the oven ; three quarters of an hour will bake it; send it up hot.

The GINSENG, or panax quinquefolium, L. is an exotic plant growing wild in North America.

The dried root of ginseng has a mucilaginous, sweetish taste, similar to that of liquorice, but accompanied with some degree of bitterness, and a slight arematic warmth, with very little odour .-The Chinese ascribe extraordinary virtues to this after giving one of his pupils a sound drubbing for plant, and consider it as a sovereign remedy in alspeaking bad grammar, sent him to the other end most every disease to which they are subject. No of the room to inform another boy that he wished proofs, however, of its wonderful efficacy have oc-

This well known plant, according to Dr. Mease, cally. The boy being quite satisfied with what he is the only native production of the United States, which answers to export in order to procure the luxuries of China. It is not much esteemed in China, unless clarified, except in times of a great no inaive case, and in an angry mood, that sits scarcity of the plant. The process of clarifying, the room wishes to articulate a few sentences to you in the present tense."

though hitherto kept a profound secret, consists in the careful application of heat and moisture to the fresh roots, and afterwards dinping them in

hot rice water, or a solution of isinglass in water-It is observed that not more than one root in twelve will clarify. This plant grows abundantly near Philadelphia.

Fruit Trees.

WILLIAM PRINCE, the Proprietor of the Linnean Botanic Garden and Nurseries at Flushing, Long Island, has the pleasure of informing the public of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Proprietor of the Linneau Republic of the Proprietor of the Linneau Republic of the Proprietor of the Linneau Republic of the Proprietor of the Linneau Republic of the Proprietor of the Linneau Republic of the Proprietor of the Linneau Republic of the Proprietor of the Linneau Republic of the Proprietor of the Proprietor of the Linneau Republic of the Proprietor of Long Issaid, has the pleasure of unforming the public, that his Nursery now contains 172 varieties of the Apple—202 do, of the Pears—76 do, of Cherries—10 do, of Plums—25 do, of Apricots—84 do, of Mulber—20 do, of Nectarines—10 do, of Almonds—14 do, of Mulber—15 do, of Mulber—16 do, of Mulber—1

Above 500 of the above kinds of Fruit are not to be found in any other collection in America. The different varieties cannot be otherwise than genuine, as the greatest attention is peid, and nearly all the kinds are inoculated from bearing trees. nearly at the kinds are inoculated from bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J. R. Newell, at the Agricultural Warchouse, 52 North Market-street, graits; and orders left there, or sent by meil, will meet prompt attention.

March 14

JAMES BLOODGOOD & Co's.

Nursery, at Flushing, on Long Island, near New York.

1N behalf of the Proprietors of the above Nursery, the subscriber solicits the orders of Horticulturists who may be desirious of stocking their gardens and fields with Fruit Trees of the finest sorts, and

most healthy and vigorous stocks the present reason.

Bloodgood & Co. attend personally to the Inoculating and Engrafting of all their Fruit Trees—and purchasers may rely with confidence, that the Trees they order will prove gentiue. The subscriber, Agent of the above Nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES. FLOWERING SHRUBS,

PLANTS

The Trees will be delivered in this City, at the risk and expense of the purchaser—the bills may be paid to lum. The reputation of this Norseyi is a extensively known, and has been so well sustained, that I take leave to refer those in want of Trees, to any of the Horticulturists in this City and its want of frees, or any or the restriction is desired, I invite those who wish to be thus satisfied, to examine the Trees in my garden at Dorchester, procured from this Nursery for three or four years pest, some of which are now in bearing, all in a healthy

and vigorous state. IF Catalogues will be delivered gratis, on application to ZEB, COOK, Jr. Rogers' Buildings—Congress St.

Landreth's Nurseries-Near Philadelphia.

Landreth's Nurseries—Near Philadelphia.
From the patronage already extended this Establishment, by
the citizens of Boston and its vicinity the Proprietors are again
induced to advertise to them their Nurseries, as offering peculiar facilities for the acquirements of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental
Trees and Shrubs—Green-house Plants—Bulbons Roots, and
Garden Seeds. The assurtment of Fruits is not surpassed in
real value by any in this country. It embraces most of the celchrated kinds of Europe with all the estcemed varieties whech
have originated on this continent. The untost care has been
observed in making the selection, and the whole is now offered
as containing none but those most worth of cellivation. Peras containing none but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and some now acquarated with the conterent varieties by mante, and desirons to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of desappointment.

The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green-house Plants,

most of which are calculated for adorning in the winter seasons, parlours, sitting-rooms, &c. with an assortment of Hardy Flowering Shrabs, and acquisitions are commanly making.

In the portion of ground albetted to Garden Seeds are grown almost every variety of Esculent Vegetables for seeding. The method pursued by the Proprietors in this branch, certainly method pursually are represented in the wild consider the subject to the slightest degree. The perparation of those kindle to mx in seeding—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendence unidoubtedly conspires in an eminent degree, to obviate the errors and impositions, anavoidable in a dependobviate the errors and impositions, maxoname in a depead-ence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Codman, No. 3f Congress-St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of hav-ing every article well and safely packed and forwarded. Feb. 15. tf D. & C. LANDRETH.

STATE COLLECTION OF MINERALS.

Mr. Fessenden,-The rapid improvements in agriculture, manafactures, and the facilities for internal commerce, bringing into requisition all our and terminate the series for the season. The product of their union is however changed; for these females deposit the eggs beforementioned, which are destined to continue the species another year, through several successive generations, without the intervention of males.

This is not the only wonderful fact; in the history of the females of the fema ought certainly to be more generally known, and it exposed to the weather.* At the time of writmore extensively applied to their legitimate uses. ing those statements, I had one experiment going In connection with this subject, every one will see on, which had not come to a result. In Septemthat a State deposite of minerals, must be of ex-ber 10, 1822 I bought a maple log, and felled it tensive utility and of very easy accomplishment. for timber to work into a mill. After working It would furnish not only to members of the legislature, but to citizens generally, on their visit to left exposed to the weather. In June 1823, I had the metropolis, a convenient opportunity of an another fallen, and left part of it exposed to the acquaintance with their mineral productions and weather by the side of the other. In October. resources. And numerous individuals in various 1825, I examined both pieces, and found the one sections of the State, already possess interest and that was felled in June was affected with white knowledge enough upon the subject to lend their rot, all through the timber; but on examining aid to forward it. Through the medium of legis- that which was cut in September, I found the outlators, a collection from their several towns might side colored in about one fourth of an inch; the very soon be made, and with great ease. And it remainder white, and as good for timber as it is hoped and believed that the legislature would ever had been. cheerfully appropriate a room in the State-house the expense of transporting, &c.

Several States in the Union have already procured collections of the kind proposed; and if a deposite should be made in the capital of each State, an exchange might be instituted, which would be mutually and extensively beneficial to the whole community. FRANKLIN.

We entirely concur with the writer of the above article respecting the importance of a deposite of minerals of the kind above described. Mineralogy is a science of great practical utility, and intimately connected with agriculture; and of course with the prosperity of the country. Man would be a savage, without minerals; deprive him of onstrate by some experiments I have made, which the locust stocks and the forest hazle; apricots, iron and you destroy more than three fourths of are conclusive to my mind. But this I must omit peaches, and mulberry scions growing in plum his physical powers. Mineral substances which till another opportunity. are valuable for manures, for buildings, for paints, pottery, medicine, and other purposes, embracing almost the whole circle of the useful arts may lurk | are mostly formed in August, with here and there undiscovered for ages, in access ble situations, but an exception; we find some formed in July, and of no service to mankind, merely for the want of some not until September. These last are not a little skill in mineralogy, a knowledge of those timber trees; and I think that in the latitude of are infallible indices of the presence of minerals. treasures.

only by giving us information of what may be found worm ever touch it. Take a young wilnut, say but of what may not be found in any particular one large enough for barrel hoops, and give it soil or location. No saline, tossil or metalliferous any exposure you please (not placing it in the bodies ought to be sought after, by any expensive fire) and it will not lose its force in two years; and laborious excavations, unless the laborer is nor will the powder-post be found upon it, where in the State of Connecticut, has awakened public guided by the lights of science. Great expenses as take it in June, and it will perish the first attention to the subject. From the foregoing exare incurred by unskilful efforts to dig coal, salt, season. lead, and perhaps silver or gold, in situations where nothing of the kind ever existed. This tive value of timber felled at the two seasons of much as the silk worm with all the varieties of might be avoided by a knowledge of mineralogy; the year above mentioned, in which I am correct, the mulherry (the leaves of which have been supand that knowledge can hardly be acquired with- or nearly so out specimens .- Editor.

FELLING TIMBER.

Mr. Fessenden,-In vol. 2d of the New England Farmer, were published a few facts respectland Farmer, were published a few facts respect-ing the most proper time for felling timber, that England Farmer. I Ibid.

rieties, doubtless, remain yet to be discovered- we intend to have the most durable, and yet have what I wanted at that time, the remainder was

In 1827, in August, I was making an engine to for the collection, and funds sufficient to defray a paper mill, and had timber to work, which was felled in June, about the 10th. The bark was left on until we worked it, when to our surprise, the white sap-wood, in some places had been rotten. This was the Quercus alba, white oak. From a consideration of the approaching scarcity of timber, in this part of the country, I have been led to communicate these remarks, not with a view of contradicting any person, for I think that a few degrees of latitude may make some considerable difference in the time when trees cease to extend their branches, and form their leaf and fruit buds for the next year, which is an indication that the sap is undergoing a change, and ceases to descend; a doctrine, which I shall attempt to dem-

In this latitude, and to one degree north-and largest tree has one hundred and fifteen stocks. nearly one to the south-the leaf and fruit buds tude, timber that is felled in September will not

	Oak,	Sept.	10.0	June	4.5	
	Maple,	Sept.	10.0	June	2.4	
	Walnut,	Sept.	10.0	June	2.5	
	Elm,	Sept.	10.0	June	1.6	
	Ash,	Sept.	10.0	June	3.2	

But by comparing the four last with white oak, provided they were all felled in September, they will stand nearly thus:

Oak, 10.0 Maple, 5.5 Walnut, 6.2 Elm, 4.5 Ash, 5.6 PIHNEAS STEVENS. Andover, June 29, 1828.

FOR THE NEW ENGLAND FARMER.

GRAFTING.

Ma. Fessenden,-Through the medium of the New England Farmer, I wish some of your correspondents would describe the best mode of management on grafted trees-say apple trees, that have this spring been headed and grafted-whose trunks are from ten to twenty-five inches in diameter, and have from twenty-five to one hundred stocks on a tree. Whether it is best to keep the young sprouts or suckers clear from the trees, or suffer them to remain to receive part of the sap? And if taken off, at what time it is best? And whether to take all at once, or part? This information would be gratefully received by one interested in the advancement of good fruit.

> Yours, with respect, A SUBSCRIBER. ·

Weston, June 28, 1828.

N. B. I have had upwards of 4000 scions set this spring, of which I think not fifty have failed of taking. Among which are pears growing in tree stocks. Most of my scions are apple-the

WATER CULTIVATION.

In the fair New England country, many a little stream flows down the hills and glistens among the verdure of the fields like a thread of silver on a robe of green, inviting the hand of skill to direct its course so as to spread the rich deposits, washed into its channel by the rain over the fields of the farmer. The effects produced by irrigation, even in seasons when the clouds are liberal of moisture, can be distinctly traced by the eyes whence the rivulets are poured on the grasseseffects not so much derived from the moisture as from the fertilizing particles borne on by its current. The rills which trickle down so copiously from their little fountains, may be made tributary to the purposes of agriculture, to an extent more considerable than is estimated by those, who neglect to employ agents so valuable and laborers so profitable. - National Ægis.

ARABIAN METHOD OF PREPARING COF-FEE.

It is found that the only certain mode of retaining the pure flavor of the coffee, is to roast, pound and hoil it, all in quick succession, the roasted berries soon losing their flavor if laid by for a day, and the pounded coffee becoming insipid, even in a few hours. The Arabs of the desert, who are from necessity economical in the use of this article, follow the same process, even if they require only two cups of the liquid, roasting a handful of berries on an iron plate, pounding them in the pestle and mortar while warm, and the instant the water boils, which it generally does by the time the other preparations are completed, so that no time is lost, putting the pounded coffee into it, and suffering it to boil, stirring it at the same time for a minute or two, when it is poured out to drink. As the beverage is taken without sugar or milk, the slightest difference in flavor is perceptible; and long experience having shown this to be the best way of preserving it in perfection, it is perhaps worth mentioning in detail, particularly as the use of this article has become so general even in England .- Buckingham's Travels.

Six convicts lately escaped from the Kentucky Penitentiary, supplied themselves with arms and ammnnition belonging to their vigilant guard, continued in platoon, as banditti, for five days within

Patent trial. - An important trial has lately taken place in New York, for an infringement of Dr. Hull's patent improved TRUSS. The defendant sold trusses made by Hovey and by Farr, who also have subsequent patents. There were two grounds of defence ;-one, that the trusses sold were different in principle from Dr. Hull's,-and the other, that Dr. Hull's were only an imitation of those made by Oddy & Co. of London. Dr's. Mott, Perkins, Rees, Osborne, and Stearns, testiqualities of Dr. Hull's truss, and that those made by Ilovey and by Farr, were imitations of them.

The usefulness and novelty of this invention had been established by physicians and surgeons of the highest respectability. It appears very fully in evidence, that this instrument was of the greatest value in surgery-had been the means of effecting cures in cases where the art had failed beretofore-had enabled persons afflicted with the disease of rupture, to pursue their business and labors without inconvenience, and in fact its invention had formed a new era in the treatment of that disease; that the instruments sold by the defendant, the one known as Mr. Farr's, and the other as Mr. Hovey's trusses, and by them patented, are clearly infringements of Dr. Hull's patent. The jury returned a verdict for the plaintiff, forthe value of the articles sold; and the court, on motion, trebled the damages, according to the statute, with costs. And it was intimated that any further violation of the plaintiff's patent, would be restrained by injunction. - Mass. Spy.

Canker worms .- Many of the orchards in the eastern part of this country, says the Springfield Republican, appear to be nearly blighted or destroved by these insects. The trees look as if a fire had passed over them. These insects have also made their appearance in the vicinity of Boston. Previous to their approach, and where their destructive effects are now seen, the fruit trees promised an abundant harvest. We have heard that a thin mixture of tar, applied to the trunk of linen. Our hompon cloth, however, is preferable, a tree, will prevent the ascent of the worm to

DRUNKENNESS.

ITS CAUSES AND PREVENTIVES.

Gentlemen: Formerly, it was a trite preverb, that " Money is the root of evil;" but it has now become obsolete, since we never hear it mentioned any more.

What then can be the cause of the present depraved state of our morals? I think that we may trace it in the general use of strong drink, which now pervades every class: what I call strong drink is, any thing that causes unusual or more than ordinary flow of spirits. This is effected, in some, by a gill of brandy; and in others by a glass of wine.

There are several causes which lead to the which bid fair to make us a nation of drunkards surpassing all other nations in that vice.

In the first place, the cheapness of liquors with us, and particularly our domestic spirits, cannot but have a fatal tendency that way. If the States happy country. would recommend to Congress to lay a tax of 25 cents a gallon on all domestic spirits, (with a corresponding advance on all foreign,) for a fund for internal improvements, and pay over to the Treasury of every State all the moneys so collected in each State, then will that vice be made to contribute much towards the general good of society; sufficient to make a new stone turnpike through State every eight or ten years.

Another cause of Drunkenness is, our mistaken notions of hospitality, in always offering our decanters of slow poison to all our friends, whenever they enter our houses, and when we call at hotels, or other public places of resort, and calling for some strong drink; every child, no matter how tridge, originally appeared above a century ago, young, must have a share of that poison, to them! Can it be wondered at, if we turn out to be a nation of drunkards, when we commence tippling ture peculiar to that time. These works profess while yet in the arms of a nurse?

victuals cooked with the slightest seasoning of salt rain, on another snow, and on a third thunder .and without any pepper, or other pungent article They also prophesy as to political events with -all of which ought to be kept in separate bottles nearly equal confinence, though not quite so dison the table, so that each person could add to suit tinctly. Thus one says that at a particular time seasoned to suit the retiated palates of the old, and and Naples;' and another tells you that, about not the purer ones, of the children, who, if left to such a date, a great minister will be impeached, articles, or by strong drink, &c.

sooner does a person addict himself to the use of alive, for the purpose of exciting religious animosdrink, and excite similar sensations on those organs which soon become much impaired in the would keep an account of the additional expenses thirst which is excited by the acidity of that poisonous weed, they will find, that it not only impovcrishes their purse, but likewise their health. For I have heard a respectable physician say, that he trology." could distil a poison from the tobacco, sufficiently strong to kill any man.

few weeks old, treated to a share of the raw rum perpetuate notions which are far more adverse to gin, or brandy, to which the mothers had been the diffusion of enlightened ideas than ignorance treated, at various country stores and taverns .-Indeed, it is a common thing, in this Western world, for the common people to give their infants a dram of whiskey as soon as born! while I would already there. The one case is like sowing on a as soon think of putting rat's bane in the mouth fallow field, the other like sowing on a field of of a child of mine, as any kind of spirituous liquor weeds. NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 4, 1828.

BRITISH ALMANACK FOR 1828.

A work with this title has been published in for such a tax as that, would produce a revenue England under the superintendence of the Society the Pennsylvania Society associated for the Promotion for the Diffusion of Useful Knowledge. We have not seen this Almanack, but find in a late number of the Gardener's Magazine a recommendatory notice, from which we extract the following remarks, which suggest ideas, useful to an American as well as an English reader. "The compilations, bearing the names of Moore and Parand they continue to be published with much of the astrological predictions and prophetic imposin the plainest terms to foretell the weather, even Another cause is, that instead of having all our to a day, stating that on one day there will be his palate-instead of which all our dishes are there will arrive good news from Cadiz, Scotland themselves, will refuse all pepper, &c. unless their or, 'a dignitary of the church driven from his pretaste has been already corrupted, by using those ferment.' Nor are they free from party politics. One gives intimations and even prints of a nature But, of all things, tobacco, whether in chewing calculated to set different religious sects in conor smoking, is the greatest provocative to the use flict; and another dates the year as the 150th of, and a preference for, strong drink: For no from the horrid Popish Jacobite plot thus keeping this strong and most nauseous of all weeds, than ity, the memory of transactions which are a disthe mouth and palate lose all relish for milk or grace to the character of this country, and the water, or any mild beverage, and long continually worst blot upon the history of its law; affirming for something even stronger than this drug, to as real, crimes in a great degree imaginary, and grossly mistaking even the notions respecting that plot which prevailed at the time. Some parts of facility of tasting. If those who use tobacco, these almanacks are not marked by much regard to decency; but there are others also greatly cir- to finish the letter in good style. These remarks they incur, in quenching the continued artificial culated, which are utterly obscene, and could apply with equal force to almost every species of never be admitted into any decent house, had not habit unfortunately reconciled the community to such things, as well as the absurdities of their as-

REARING SILK WORMS.

By the kindness of Dr Mease, of Philadelphia. (a gentleman whose enlightened philanthropic exertions to promote the useful arts have rendered him as well known as he is highly respected,) we have received two copies of a pamphlet entitled " Directions for the rearing of Silk Worms, and the culture of the White Mulberry Tree. Published by of those Objects." Likewise some seeds of the White Mulherry Tree, with directions to "give them to one man, who will make a business of rearing the trees ;- and let him have the profit."

The pamphlet contains 25 pages large octavo, closely printed; and we concluded not to commence reprinting it so near the termination of our present volume. We intend to give 'extracts, or perhaps the whole pamphlet in the next, or seventh volume of our paper. The white mulberry seed we should be happy to present to any gentleman, who would engage to comply with the above mentioned condition of the donation.

A day or two since, a gentleman arrived in this city, from Detroit, via the Erie canal, with 100 hogsheads of Tobacco! It was raised and cured in the Michigan territory; is of a fine quality; and was disposed of in part, at a low rate, but at a fair profit, in this city.

Much attention is now paid in that and other of the Western States and Territories, to the culture of this plant; and the day is, perbaps, not distant, when through the great source of local wealth, (the western caual,) it will find a market at the North .- Albany Argus.

How to write a Letter .- Let the writing be so plain that every body can read it, and the meaning be so plain that every body can understand it. Admiral Collingwood, in a letter to his daughter, says that "if pens are bad, they should be mended," and more time is lost in making the apology for great haste, than would have been necessary writing.

Thirty thousand silk worms are now in operation at a farm near Baltimore. The worms, with "When it is mentioned that the sale of these specimens of silk, are shown gratuitously to the

disappear. Being a heavy insect they never wantroubled from the neighboring stocks. We have the above facts from a scientific and practical agriculturist, who says that two pailsful of beetles were collected on the first experiment; and that ago, and since that time they have entirely disap- against such mistakes in future. peared. - N. Y. Eve. Post.

TO ESCAPE THE EFFECTS OF LIGHTNING.

It is particularly dangerous to stand near leaden sponts, iron gates or palisadoes, at such times; metals of all kinds having so strong an attraction for lightning as frequently to draw it out of the course which it would otherwise have taken.

When in a house, avoid sitting or standing near the window, door, or walls, during a thunder storm. The nearer a person is to the middle of a room, the better.

The greatest evil to be apprehended from lightning, is the explosion of powder-magazines .-These may, in a great degree, be secured from danger by insulation, or by lining the bulk-heads and floorings, with materials of a non-conducting nature, the expense of which would not be great.

Lake Superior .- According to the late surveys of the boundary between the United States and Canada, about one thousand rivers empty theniselves into this enormons inland sea. It is estimated that an elevation of nine feet of waters of the lake would cause them to flow over into the source of the Mississippi instead of running in its present direction. An earthquake, such as was experienced at Chili in 1822, might be attended with tremendous consequences to this region of the country.

Revolving rake .- A patent revolving hay and harrel only, at a low price. grain rake has lately been introduced into this State, (says the Portsmouth Journal) and considered a highly important and useful invention .-With a horse, one man and a boy, it rakes clean, and by its revolving, discharges the hav into winrows without stopping the horse or lifting the rake. It will do as much work as ten or twelve men with hand rekes; and no farmer will dispense with it in gathering his hay and grain after once seeing it in operation.

Farmington canal. - On Friday the 27th instant the first canal hoat, called the Jas. Hillhouse, was launched at Farmington, Conn. on the canal at that place, under a salute of artillery, with a band of music, &c. A party of two hundred ladies and gentlemen embarked on board, and were drawn by a team of decorated grays a few miles on the new channel opened to commerce in that direction. They crossed the Farmington river, on an aqueduct thirty-six feet in height, partook of resolved to the state of the state o new channel opened to commerce in that direcfreshments on the excursion, and returned at sunset, amidst the acclamations of a large concourse of spectators assembled on the rationally joyful occasion .- N. Y. Statesman.

Pain in the eyes .- A correspondent at Scituate It may not be generally known that the beetle, requests us to publish the following receipt for the which frequently commits serious ravages on cure of severe pains in the eyes: Make a strong fruit trees, may be effectually extirpated by shak- decoction of bitter herbs, such as wormwood, taning them from the trees every evening. By pur- zey, hoarhound, penny-royal, &c. and hold it, hollsuing this course for a few days they will entirely ing hot, so near the eyes, that the steam will ascend into them. It has been known to give imder far, so that there is but little danger of being mediate relief, in many cases. - And further, he requests us to ask if any remedy is known for weak eyes of ten years' standing?

The Emperor of China, by a late edict, severeafterwards the number regularly decreased until ly censures his sheriffs for their frequent mistakes the fifth day, when only two beetles were to be in executing one prisoner instead of another, as found. The experiment was made two weeks described in the death warrant, and cautions them

AGRICULTURE.

Thou first of arts, source of domestie ease, Pride of the land, and patron of the seas, Thrift Agriculture! lend thy potent aid; Spread thy green fields where dreary forests shade; Where savage men pursue their savage prey, Let the white flocks in verdant pastures play; From the bloom'd orchard and the showery vale Give the rich fragrance to the gentle gale; Reward with ample boon the laborer's hand. And pour thy gladdening bounties o'er the land. Coumhia's sons, spurn not the rugged toil; Your nation's glory is a cultur'd soil. Rome's Cincipuatus, of illustrious birth, Increased his laurels whilst he till'd the earth : E'ven China's Monarch lays his sceptre down, Nor deems the task unworthy of the crown.

Reasons for emigrating.—A Scottish gentleman in the warmth of national veneration, was praising Scotland for the cheapness of provisions; a salmon might be bought for saxpence, and a dozen mackerel for twapence. "And pray, sir," said one of the listeners, "how came you to leave so cheap a country?"-"In gude troth, mon," replied the Scotchman, "although fish is plentiful enough, the saxpence and twapence are unco

In old times it is said a parishioner thought himself cheated if a sermon were less than an hour long. Now, short sermons are called for.

A farmer hired a man to break flax by the day, and he said he could hear all day long the slow sound By-the-d-a-y-By-the-d-a-y-Bythe-d-a-y. He afterwards hired him by the job; the music was then changed to double quick time -By the job, By the job, By the job, job, job.

The clerk of a church in England lately gave notice of a parish rate in the following manner: "I am desired to give notice that the third levy is assessed five pence in the pound," and without pausing, added, "let us sing to the praise and giory of God,

"Lord what a wretched land this is, That yields us no supplies.

Longevity .- There are 17 men now living in New haven, whose united ages amount to 1413 years. The average of each individual is eightythree years. In addition to these, there are twenty-seven men, whose united ages amount to 1971 years, and whose average age is 73 years. The average age of the two together is about seventyseven years.

Eggs, Rags, and Rum .- A few days since, as I was journeying back from the sea-board, I called at a store in - to bait my horse. While I was waiting for the wearied animal to take his allowance, there came in a squalid looking woman, and would in time of war. We are far behind our passing to the counter, in a low voice inquired of the clerk-'Have you any rum?' She was answered agreeably to her wish. 'Give me a quart,' said she, handing him a jug, and at the same time beginning to lay out upon the counter-from a covered basket, the quid pro quo .- There are nine of your eggs,' said the clerk. 'Here are some paper rags also,' said she of the brown jug. They were thrown into the scales, and raised a twelve ounce weight. 'You have 3 of a pound,' said the clerk. 'The eggs and the rags come to nine cents-the rum is ten.

By this time the fire in my bones began to burn. Rising from my seat, I said, 'Good woman, have England for hose for engines. A certificate, in you a family? 'No,' was her reply, and, as if con- its favor, is published by a man who had 126 feet science was beginning to do its office, she added, in constant use two years. It answered the pur-'I hav'nt got it for myself.'

The sequel I will not relate, only that I went woman had been picking up a rag here and a rag rior for suction hose. there-and had been anxiously watching her hen for nine successive days. And for what? For the means of gratifying a raging and an unconquera- by the Saco Manufacturing Company, will conble appetite. These are thy triumphs, O rum!

same impression on your mind as it did on mine, you will throw it into some corner of your useful

"Forty."-A writer in the Atheneum, under the the public. head "Biblical Criticism," has some curious observations on the word "forty," as used in the Scriptures. He observes that this numeral, which occurs so frequently, and in places where its inpassages that precede and follow it, is in the Had Irreshing Machine, Ke. troduction is manifestly at variance with the East, constantly used as a general term, implying "many" or indefinite numbers, as we use the words "score," and "dozen or two." A ruined palace at Persepolis is called "Csehniminar," or the "forty pillars," though it has but 19 standing, and when perfect had 260. The Arabs also use one thousand and one in a similar manner. Thus Moses was in the Mount "forty" days, means many, not "forty" years in the wilderness. This meaning explains numerous difficulties in Scripture history. And Persians, Arabs, and Turks, still use the term "forty" in this case.

The Militia .- A correspondent in the Lowell Journal, signed "8000," thus notices the militia system: Of all the laws of the present day, there is none that operates so unequally on all, and so large portion of society as does the present odious militia system. It is also very injurious to the welfare of society-induces idleness, drinking and many other vices. It is a tax on the rich man's purse, and a tax on the poor man's time. If the sum of money is to be got rid of, we say apply it to some nobler object. In vain may we build churches, have prayer meetings, form societies for suppression of intemperance, &c. &c. We say in vain may we do these things unless we abolish entirely the militia system. No man has ever yet shown that the country has been benefitted, by these trainings. The system has none other for its advocates, except those who are, like children, "pleased with a rattle, tickled with a straw;" who admire to strut about dressed in regimentals, and to exhibit themselves to the gaze of the public, to show to the world how much braver they appear in times of peace, than they southern friends in this business. In Marvland. of so little consequence is it, that, by paying two dollars you are exempt, any body old or young for the year. Every one ought to read the Rev. Mr. Pierpont's sermon before the Ancient and Honorable Artillery, on the Election day, 1828. It shows the militia system in its proper light .-The supporters of the system are decreasing every day and it must ere long go down-downnever to rise again .- Salem Observer.

DOMESTIC ECONOMY.

From the Boston Daily Advertiser.

Although the means of preventing and destroying putrid or infectious miasmata, by the use of chemical agents, have been long known, they have been resorted to for the most part only on occasions of alarm. They may be made to conduce so much to our comfort and health at this season. that I venture to send you a brief notice of a preventive and remedial agent, which may be employed in any situation, and under all circumstances.

Within a few months great use has been made in France of a chemical compound of chlorine gas and lime or soda, for the purpose of destroying the offensive odours arising from putrifying animal and vegetable matters. The first use of this compound was in a case of judicial inquiry, where it became necessary to disinter a body for examination, and by it the effluvia was destroyed in an hour or two.

For all common purposes, the effects of the compound of time and chlorine, known in commerce as "bleaching powder," and "bleaching salts," are similar to those of the substance used in France under the name of "Labarraque's Disinfecting Soda Liquid."

The bleaching powder may be sprinkled about an apartment, or a small quantity thrown into a vessel which it is desirable to purify; or it may be dissolved in water, and cloths be dipped in the solution, and afterwards be brought into the vitiated atmosphere. Vehicles for the removal of offensive substances, as well as the substances themselves, may be freed from all offensive odour by the use of the powder, while at the same time the fertilizing powers of those substances are remarkably increased-a fact which has been established by actual experiment.

In some situations and apartments, a few spoonfulls of the powder may be mixed with the sand with which the floors are usually sprinkled. The many occasions, both in public and private, where this purifying agent may be advantageously employed, must be obvious.* It is sometimes desirable to prevent the rapid change of a dead body previous to interment; this would be accomplished by a small quantity of the dry powder within the coffin, or by the application of the moistened clothes.

In descending into vaults, pits, sewers, &c. if the air breathed be passed through a sponge which has been wet with the solution, the person can remain some time without injury in situations where others not so provided would infallibly be destroved.

The use of this substance in the sick chamber will be found a source of no slight comfort, and even safety in some diseases; and it has been applied to ulcers and putrescent sores with manifest

GOOSEBERRY PUDDING.

A pint of stewed gooseherr'es, with all their juice. A quarter of a pound of powdered sugar. Two ounces of fresh butter. Two ounces of grated bread. Three eggs.

Stew the gooseberries till quite soft. When they are cold, mash them fine with the back of a to the table. spoon, and stir into them two ounces of sugar .-Take two ounces more of sugar, and stir it to a cream with two ounces of butter.

weigh two ounces.

Beat three eggs, and stir them into the butter and sugar, in turn with the gooseberries, and by taking off the lid, and pouring in a little cream

Lay puff-paste in a soup-plate. Put in the mixture, and bake it half an hour.

Do not grate sugar over it.

BLACK CURRANT JELLY.

Pick the currants from the stalks, wash and drain them. Mash them soft with a spoon, put all the juice is pressed out. them in a bag, and squeeze out the juice. each pint of juice, allow three quarters of a pound best loaf-sugar. Put the juice and the sugar into of loaf-sugar. Put the juice and sugar into a preserving kettle, and boil them about ten minutes, it all the while. Pour it warm into your glasses, skimming them well. Take it immediately out of set it for several hours in the sun, and when cold, the kettle. Put it warm into your glasses. it up with brandy papers.

that it requires less sugar and less boiling than dark colour. any other jelly.

FRUIT PIES

Fruit pies for family use, are generally made with common paste, allowing three quarters of a pound of butter to a pound and a half of flour.

Peaches and plums, for pies, should be cut in half, and the stones taken out. Cherries also should be stoned, and red cherries only should be used for pies.

Apples should be cut into very thin slices, and are very much improved by a little lemon-peel .-Sweet apples are not good for pies, as they are very insipid when baked, and seldom get thoroughly done. If green apples are used, they should first be stewed in as little water as possible, and made very sweet.

Apples, stewed previous to baking, should not be done till they break, but only till they are tender. They should then be drained in a cullender and chopped fine with a knife or the edge of a

In making pies of juicy fruit, it is a good way to set a small tea-cup on the bottom crust, and lay engaged in removing night soil; and particularly to such fatoriers in Brookline. Brighton, &c. as have in deposited on their farms. The "Blacking Salts" alluded to can be purchased at the New England Farmer seed store in any quantity.

The fruit all around it. The juice will collect under the New England Farmer seed store in any quantity.

The fruit should be mixed with a sufficient of the pie. of the pie. The fruit should be mixed with a suf. Road elegantly printed on them.

that of vinega, and the various substances resort- ficient quantity of sugar, and piled up in the mid-

Dried peaches, dried apples, and cranberries should be stewed with a very little water, and allowed to get quite cold before they are put into the pic. If stewed fruit is put in warm, it will make the paste heavy.

If your pies are made in the form of shells, or without lids, the fruit should always be stewed first, or it will not be sufficiently done, as the shells (which should be of puff-paste) must not bake so long as covered pies.

Shells intended for sweetmeats, must be baked empty, and the fruit put into them before they go

Fruit pies with lids, should have loaf-sugar grated over them. If they have been baked the day before, they should be warmed in the stove, or Grate very fine, as much stale bread as will near the fire, before they are sent to table, to soften the crust and make them fresh.

Raspberry and apple pies are much improved just before they go to table. Replace the lid very carefully.

RED CURRANT JELLY.

Wash your currents, drain them, and pick them from the stalks. Mash them with the back t a spoon. Put then in a jelly-bag, and squeeze it till

To every pint of juice, allow a pound of the your kettle, and boil it fifteen minutes, skimming tie it up with brandy paper. Jellies should never be allowed to get cold in the kettle. If boiled too The juice of black currants is so very thick, long, they will lose their flavour, and become of a

Strawberry, raspberry, blackberry, and grape jelly may be made in the same manner, and with the same proportion of loaf-sugar.

Red current jelly may also be made in a very simple manner, by putting the currants whole into the kettle, with the sugar; allowing a pound of sugar to a pound of currants. Boil them together fifteen minutes, skimming carefully. Then I them into a sieve, with a pan under it. Let them drain through the seive into the pan, pressing them down with the back of a spoon.

Take the jelly, while warm, out of the pan and put it into your glasses. Tie it up with brandy paper when cold.

Lusus Natura .- A Royal George peach tree, cultivated in the garden of the Rev. Mr. Howman of Beccles, produced, last season, rather a large fruit, three parts of which were peach, and one part nectarine, quite distinct in appearance as well as in flavour .- Gardener's Magazine.

Mr. Andrew Hook, No. 165 Market street, Baltimore, has prepared handkerchiefs from India silk, with views of the Baltimore and Ohio Rail

[&]quot;We recommend this excellent article to the attention of those

MOWING.

They who have not been in their youth accustomed to do this work, are seldom found to be able to do it with ease or expedition. But when the art is once learnt, it will not be lost.

husbandman's calling, and the more fatiguing as it must be performed in the hottest season of the year, every precaution ought to be used which tends to lighten the labour. To this it will conduce not a little, for the mower to rise very early, and be at his work before the rising of the sun .-He may easily perform half the usual day's work before nine in the morning. His work will not only be made easier by the coolness of the morning air, but also by the dew on the grass, which is cut the more easily for being wet. By this means he may lie still and rest himself during all the hottest of the day, while others who begun late are sweating themselves excessively; and hurting their health, probably, by taking down large draughts of cold drink to slake their raging thirst, sown this month for the supply of autumn, and The other half of his work may be performed after three or four o'clock; and at night he will find himself free from fatigue.

If the mower would husband his strength to advantage, he should take care to have his scythe, and all the apparatus for mowing, in the best orface on which he mows. If the surface be level &c. &c. and free from obstacles, the scythe may be long with less labour, and greater expedition. But if ry weather, or on the approach of rain, or imme-extract." stones, or stumps of trees, his scythe must be short seedling plants. and crooked. Otherwise he will be obliged to in cutting it. A long and straight scythe will only cut off the tops of the grass in hollows.

A mower should not have a snead that is too ual tremor, and do much to hinder its cutting .-He must see that it keeps perfectly fast on the snead; for the least degree of looseness will oblige him to use the more violence at every stroke .-Many worry themselves needlessly by not attending to this circumstance.

Mowing with a company ought to be avoided till they are in seed. by those who are not very strong, or who are litbitious to be thought good mowers, often find themselves much hurt by mowing in company.

Mowers should not follow too closely after each from place to place, it should be bound up with a rope of grass, or otherwise carefully secured.

"Mr. de Lisle introduced in England, the mowing of wheat. The method is this: The scythe he uses is at least six inches shorter in the blade than the common scythe; and instead of a cradle, has two twigs of esier put semi-circular wise into holes made in the handle of the scythe, near the blade, in such a manner that one semi-circle inter-

"By this method of mowing wheat, the standing corn is always at the left hand. The mower mows it inward, bearing the corn he cuts on his scythe, till it come to that which is standing, against which it gently leans. After every mower them in small shallow drills, to preserve the moist follows, a gatherer, who being provided with a ure longer; and water them well at planting. book or stick, about two feet long, gathers up the

corn, makes it into a gavel, and lays it gently on give them but little water, as much moisture will the ground. This must be done with spirit, as a-retard the ripening, and prevent their acquiring nother mower immediately follows."-Com. Farm. that rich flavor peculiar to this fruit. If they are

As this is one of the most laborious parts of the of mowing their wheat; which will undoubtedly answer also for other sorts of grain .- Deane.

> Soap, saving of .- For the use of private families, where linen is dirty by perspiration or grease it will be of great service towards rendering it white, to steep it for some time in a clear liquor, made by mixing one quart of quick lime in ten gallons statements made of its ingredients, very ill to deof water, letting the mixture stand 24 hours, and serve its renown. The proportion of the malt then using the clear water, drawn from the lime. After the linen is steeped in this liquor it should be washed as usual, but it will require much less soap to be used.

KITCHEN GARDEN-JULY.

Several successional crops are required to be some main crops for winter consumption. Many

a foot or fifteen inches from each other. Plant

If your melons are advanced to full growth. Pock, caught from the cows.

As reaping is slow and laborious work, it would ripe gather them in the morning. Mature ripebe right for our countrymen to learn this method ness is sometimes shewn by the fruit cracking at the base round the stalk, or by changing yellowish, and imparting a fragrant odour.

Radishes may be sowed for an autumn crop to draw next month.

LONDON PORTER.

This popular beverage would seem, from the consumed to the porter made, shows that if malt and hops aloue were used, the liquor produced would not be so intoxicating as the most waterv small beer. Its inebriating property must arise, therefore, from some other ingredients. What is called "porter essence" is the most in use for this purpose. The following is said to be the recipe for this agreeable and highly salutary compound :

"Take 1 cwt. of Spanish liquorice, and 4 lbs. of principal crops will be now arrived to full perfec- copperas, boil them together in a copper pan, in 3 tion, and some mature crops all gathered. When gallons of water, Then take 1 cwt. of molasses the latter is the case, the ground should be clear- or treacle, and ½ cwt. of raw sugar, and boil them ed and dug for succeeding ones, or for some gen- till they thicken a good deal, add the mixture eral autumn and winter crops, as turnips, cabba- above mentioned, and boil altogether two hours. der. His scythe ought to be adapted to the sur- ges, savoys, brocoli, cauliflowers, celery, endive, When cold, add the following ingredients, in powder, 4 lbs. of gentian root, (ground) 4 lbs. of orange pease, 2 lbs. of ground calamus root, and and almost straight; and he will perform his work will be more successful if done in moist or showe- stir and mix till the substance becomes like a soft

Other ingredients are used, such as quassia, the multum powder, as it is called, to save hops, the coculus indicus, and nux vomica, which are in the highest degree destructive to animal life, though their immediate effect is only a kind of stupid intoxication. More than 30,000 lbs. of nux vomica, and more than 12,000 lbs. of coculus indicus, are annually imported into Great Britain. As the only other use for these drugs, besides their infuconcluded that nearly the whole goes into the this delectable beverage which gives London porwhich are mistaken for health, but which rather Plant the last crops of beans, for late produc-betokens so much solidified hydrogen, ready to take

TREATMENT OF GOOSEBERRY BUSILES.

As soon as the leaves are all fallen, I begin pruning, and dunging, if need require. I then dig the ground between the bushes, leaving the ground as rough as possible; and as the diggers are proceeding, that is, as soon as they are clear of the first plant in the row, I give the bush, from the rose of a watering-pot, at least an English gallon of the following mixture, of equal parts, viz. lime-water, chamber-ley, and soap-suds, in which I introduce as much soot as to give the composition the color and consistence of rich dunghill drainings; proceeding over the whole in this manner, without treading or poaching the ground: in which state they remain until the winter frosts are fairly past, when I level and dress up the ground between with a rake.

This practice I have invariably performed, and have always had healthy fruitful bushes, and never in the least annoyed with any insects on the bushes so dressed. JOHN NAISMITH.

HOW TO PICKLE WALNUTS.

Scald slightly, and rub off the first skin of a hundred large walnuts, before they have a hard shell: this may easily be ascertained by trying them with a pin. Put them in a strong cold brine. put new brine the third and sixth days, and take them out and dry them on the ninth. Take an ounce each of long pepper, black pepper, ginger, and allspice; a quarter of an ounce of cloves, some blades of mace, and a table-spoonful of mustardseeds: bruise the whole together, put into a jar a layer of walnuts, strew them well over with the mixture, and proceed in the same manner till all are covered. Then boil three quarts of white wine vinegar, with sliced horse-radish and ginger, pour it hot over the walnus, and cover close.-Repeat the boiling of the vinegar and pour it hot over, three or four days, always keeping the pickle closely covered; add at the last boiling a few cloves of garlic, or shallots. In five months they will be fit for use.

A Tropical Climate.-Insects are the curse of dation of a tremendous ulcer. In a moment you are covered with ticks. Chigoes bury themselves in your flesh, and hatch a large colony of young This I have never seen except in my own garden; chigoes in a few hours. They will not live tobut it is the practice in some parts of Italy, where gether, but every chigoe sets up a separate ulcer, and has his own private pus. Flies get entry into your mouth, into your eyes, into your nose. You feet, and then stretched horizontally. It is no and warm places: this is following the English eat flies, drink flies, and breathe flies. Lizards, unpleasant thing to see a cherry tree on one hand, mode, where the climate requires it. Here my cockatrices, and snakes, get into the bed-ants a pear tree on the other, and a peach tree not far vines that are most exposed, bear equally if not eat the books—scorpions sting you on the foot every thing stings, bites, or bruises-every second of your existence you are wounded by some piece of animal life, that nobody has ever seen before, except Swammerdam and Mariam. An insect themselves, and have generally allowed it to be water; these are the best bearers, and pleasantest with eleven legs is swimming in your tea cup-a non descript with nine wings is struggling in the small beer, or a caterpillar with several dozen eyes in his belly is hastening over the bread and cannot write in their technical language; it is so well. I am now trying to raise the Madeira butter! All nature is alive, and seems to be gaththerefore hoped they will excuse the inaccuracies grape, having received a few cuttings, which came ering her entomological hosts to eat you up as you are standing, out of your coat, waist-coat and breeches. Such are the tropics. All this reconciles us to our dews, fogs, vapor and drizzle-to our apotheccries rushing about with gargles and tinctures-to our British constitutional coughs, sore throats, and swelled faces .- Edinb. Review.

the Apple and Pear.

The inexperienced planter will suppose that much time will be lost in propagating new kinds, as these will not produce fruit so soon as grafts of those which have been long in cultivation; but he will soon find that the fruit of very small young trees by no means repays him for the injury they sustain in growth. If the seeds, from which new varieties were expected, and those intended merely to produce stocks, were sowed in the same season, the merits of those varieties would generally be known, as early as the stocks would have gained proper size and strength in the nursery, and have become after being moved, firmly roofed in the ground, where they are to remain; and if the stocks were then to be grafted in the branches, with those new varieties, I know no means by ditiously raised.

It has been recommended to remove the young trees once or twice during the time they remain in the nursery, under the idea of increasing the number of their roots; but I think this practice only eligible with trees which do not readily grow when transplanted. I have always found the growth of young apple trees to be much retarded, and a premature disposition to blossom to be brought on by it, and I could not afterwards observe that those trees, which had been twice removed, grew better than others. It has also been supposed that many small roots, proceeding immediately from the trunk, are in the future growth of the tree to be preferred to a few which are large; but as the large roots of necessity branch into small, which consequently extend into a greater distance, the advantages of more transplantations than from the seed-bed to the nursery, and thence to the orchard, may reasonably be ques-

tioned. The apple tree succeeds best in situations which are neither high, nor remarkably low. In the former its blossoms are frequently injured by cold winds, and in the latter by spring frosts, particularly when the trees are planted in the lowest part of a confined valley. A south, or southeast aspect is generally preferred, on account of the turbulence of the west, and the coldness of the north winds; but orchards succeed well in all aspects; and where the violence of the west wind is brokaspect will be found equal to any. The trees attain their largest stature in a deep strong loam; but will grow well in all rich soils, which are ncither excessively sandy nor wet. An orchard, generally, is most productive of fruit, when it is situated near the fold-yard, and is in consequence much trodden and manured by the cattle in the winter; and hence it will not unfrequently be found advantageous to plant on the site of an old orchard. The ground, however, in which old apple trees have grown, is esteemed very unfavorable to young ones. When from contiguity to the house, an orchard is planted in this kind of ground, the pear and apple should be made to succeed each other, as has been judiciously recommended by Mr. Marshall. The roots of the pear descend to a greater depth in the ground than those of the apple tree; and as the stocks of neither of these fruits will afford proper nutriment to the other, it may be questioned whether their action on the soil be perfectly similar.

In the choice of fruits of every situation, atten-

the end of August.

erous. I would recommend the grafts to be taken of rearing the tree .- Mass. Spy. from an improved crab, in preference to the degenerated apple; for the former will possess much of the hardiness and vigor, whilst the latter will often inherit the debility and diseases of the parent tree. Proper fruits of this kind might probably be obtained from a crab of a deep yellow color, and in taste rather astringent than acid, trained to a south wall, and impregnated with the faring of a rich early apple, in the manner already recommended. But both the red, and the yellow Siberian crabs possess qualities, which appear to give them great advantages over every English variety. Their blossoms are in an extraordinary degree, capable of bearing cold; the fruit attains a very perfect and early maturity; it is in color and beauty unrivalled, and contains but a moderate portion of acid, compared with its astringency.

I am well satisfied that the fruits, I have obtained from these, will flourish and make fine ciders in many situations where kinds which have been more improved by cultivation will not succeed; and when old trees, whose branches have been taken off, are to be engrafted, I have no doubt but that fruits of this kind, just arrived at the bearing age, may be used with very great advantage. The leaf and habit of an improved crab en by an intervening piece of ground, a southwest will generally indicate a worse fruit, and of a degenerate apple a better, than the trees will afterwards produce; but this remark does not appear to me to be applicable to those fruits, whose degeneracy, or variation, has been produced by the introduction of the farina of another kind.

GRAFTING AND INNOCULATION.

It is not nureasonable to suppose that the benefits to be derived from the engrafting and innoculation of fruit trees, are far from being fully realized. Aside from the neglect of improving orchards, where there is nothing to prevent but the disposition to procrastinate and delay-so prevalent with all-we believe that the process is of in poor esteem: they seldom contain the vital much more extensive application than is generally principle. known, and that it may be the means of introducing the cultivation of fruits, now imported from abroad at a great expense. It has been ascertained that the shag-bark walnut may be successfully engrafted, and that the engrafted trees are much the surest bearers. Where this not the New-Hampshire. case, the difference in the quality of these nuts

Extracts from Knight's Treatise on the Culture of tion should be paid to select such as are sufficient- would make it an object to engraft most of the ly early to ripen well in it; for if the fruit be not walnut trees. Some have a very thin shell, and ripe, its produce must ever be crude, harsh or un- a thick, large meat-while others have a thick palatable. GREEN FRUIT.

It may not be amis to remind parents, and all those who have the immediate oversight of children, that unripe fruit already begins to appear in our markets. It is possible that more children's lives are destroyed, in the summer, by this cause of disease, than almost all others put together .-Apples which are shaken from the trees by violent winds, or fall prematurely by decay, are immediately gathered and brought to market; the display of them is too tempting to children to be withstood; and of course, they are purchased, and eaten. Nothing is more pernicious, and yet nothing is more common, than to see children and young persons eating this kind of fruit. We should think that parents would lay a more strict injunction against this indulgence upon their children. They must, unless they can make up their minds to risk their health and their lives .- N. Y. Adv.

SILK WORMS.

The white silk worms hatch twice a year-the yellow but once. The latter spins much the largest ball, and is accounted the most valuable and least troublesome.

The price of eggs is sixpence a thousand. Each miller desposits about 400 eggs.

It is calculated that the worms produced from the eggs of 200 millers, or winged worms, will make ten pounds of silk.

One hundred and fifty pounds of leaves, it is estimated, are eaten by 1000 worms, to spin I lb. of

It takes about 1 bushel of yellow cocoons or balls, to make 14 lbs. of silk.

One ball of silk, of the yellow kind, when spun will measure 1750 feet.

The eggs of the silk worm are of two colors; a lightish slate, and a yellow. The latter are held

THE SHAKER'S CIDER.

A tourist whose observations appear in the New York Commercial Advertiser, gives the following respecting the mode of making and preserving cider as practised by the Shakers of Canterbury, in

"Their fine cider sells in Boston for \$10 the

barrel, a fact which has several times gone the ming and good management had become so closeor throughout. It is then pressed in the usual harmony with the seenes around. manner, and the cider is put into casks perfectly five years old."-Hartford Times.

AN ENGLISH COTTAGE.

There is a family at Winson Green, just in the vicinity of B -m, which I have occasionly seen; and as I consider them, in manners and style of living, a very good sperimen of those middle walks of life, I will give you an account of a late visit there, and will mingle character and description with incident. At the close of a fine day, a young Bostonian and myself, conducted by a son of the family, called at the door of their cottage. By cottage you will not understand me to mean a ON LIVERWORT AS A CURE FOR CONone-story, straw-thatched building, half hid in woodbine, but a neat two-story brick mansion, covered with slate. We paused a few moments in the front garden, to look at its arrangement. I have often had occasion to admire the taste, which Englishmen of this class exhibit in laying out and decorating their gardens and pleasure grounds .-Whenever they fix upon a spot and call it 'home,' they collect about it every little comfort and elegance that their means will admit. A garden seems to be the primary object in their rural economy; and even when their means are seanty, and they are necessarily confined to a narrow spot of ground, they contrive to throw over that spot a thousand beauties. This taste, I conceive, cannot be too highly commended. It is not less elegant in itself, than it is favorable to purity of manners. The same fondness for a garden and flowers may be traced in the lowest artizans and cottagers; and when they are denied the luxury of a garden, they will make a garden of their houses, and fill every window with flowers, and plants. The garden which we were now surveying, was enclosed with a hawthern hedge, and two gravelled walks led up each side of a closely shaven oval grass plat, to the front door. Trees of various kinds mingled with shrubbery skirted the edges, and gave to the centre a charming aspect of pensive retirement, and rural quietness .-The lawn, by the use of a cast iron roller, and frequent shaving, had become extremely smooth, and was not only cheering to the eye, from its vivid green, but pleasant and soft as down to the foot.

in a hawthorn hedge, which, by constant trim- ica, &c.

rounds of the newspapers. We made particular ly interwoven and matted together, as to form as inquiries respecting their mode of manufacturing effectual a barrier against the intrusion of cattle of Europe, and also in Asia, Africa, and America, this article, but could not learn that they had any or the prying curiosity of man, as a brick wall itpeculiar process. Their fruit is of the ordinary self. The hedge under the hand of a skillful garkind, and the apples are gathered as they fall, and dener, can be made to assume the most fantastic housed. Late in November they are ground in a shapes. This was so close, that neither the hand understood in the United States, that no directions mill, after the delective ones have been carefully nor the eye could penetrate it; and clothed as it on the subject are requisite. SUMPTION.

The plant called liverwort, has recently acquired, through the medium of the newspapers, considerable celebrity as a remedy for consumption. Its reputation is altogether unmerited; its administration must be pernicious in ninety-nine hundredths of the cases in which the lungs are affected. Its operation is decidedly stimulant; and the faculty well known how few pulmonic patients will bear remedies of that description. A patient of mine insisted upon using the liverwort in spite of my remonstrances. It gradually accelerated his pulse until a spitting of blood was the consequence. This satisfied him, the plant was abandoned, and his health immediately began to improve. Like other excitants, the liverwort when as I have stated .- N. Y. Farmer.

speech may be effectually cured-where there is nearly four millions of tons of coal. It is thus deno malformation of the organs of articulation, by monstrated that the coal fields of Pennsylvania a perseverance for three or four months, in the will supply one million of tons, or twenty-eight simple remedy of reading aloud with the teeth millions of bushels of coal annually, for nearly closed, for at least 2 or 3 hours in the course of sixty thousand years. Enormous as this compueach day .- London paper.

Temperance. The people of Hardwick, Verment, have universally agreed to discontinue the use of ardent spirits except as a medicine, and the merchants have ceased to keep it except in the From the front garden we were conducted way they keep other medicines. It occupies (we through a gate at one corner of the house, into suppose) its proper place among other medicines the fruit and flower garden. This was somewhat and poisons, such as arsenic, oil of vitriol, aqualarger than the other. Like that it was enclosed fortis, laudanum, spirits of turpentine, nux vom-

MELONS.

These are cultivated in all the warm countries where its salubrious and cooling fruit is greatly

The cultivation of the water-melon is so well refreshing article of diet in our warm summers, sweeter kind yield, on inspissation, a bright light colored syrup, which would answer every purpose delphia, procured half a pint of this syrup, from fourteen pounds of melon juice, a part of which I tasted, and found very pleasant. Mr. Dordlev. of the fruit, makes the following calculation upon Mr. Drinker's experiment: "Melons growing at 51 by 51 feet apart, are 1,433 plants on an acre; these bearing two melons of 14 pounds each, yield 4000 pounds of melous, 1,433 pints of syrupwhich, at ten cents, would come to one hundred

Taking the amount at one half the above sum. it would be more than is produced from many poverished soils. Having millions of acres coverfit only for the cultivation of the water-melon, the United States need be under no apprehension of the want of sugar. Dr. Pallas, in the account of his journey to the southern province of Russia, in 1793 and 1794, speaking of a colony of Moravians at Sarepts, or Sarpa, on the river Volga. says, "the ingenious inhabitants of this town brew a kind of beer from their very abundant and cheap water-melons, with the addition of hops; they also prepare a conserve or marmalade from this fruit, waich is a good substitute for syrup or treacle."-Domes. Encyclopedia.

Tn Lombardy Poplar .- It is observed that the Lombardy poplar is decaying in every part of our State. I have seen hundreds, nay thousands, this spring, in our north and northwest sections, many of which has put forth their vernal foliage with vigor and luxuriance, and have since withered and died .- A. and Argus.

Coal in Pennsylvania .- It has been estimated. first taken, improves the feelings of the patient; and we think with great propriety, that one third and hence perhaps, in part, its popularity. Its of the whole State of Pennsylvania, is pervaded ultimate effect must in general, however, be such with coal, and we may safely put this down as averaging at least 3 feet in thickness. The whole area of the commonwealth is 43,950 square miles: Cure for stammering .- Those who suffer under one third of this is 14,650-the area of the coal the distressing affliction of an impediment in their fields. A square mile at three feet thick will yield tation may seem, we venture to say it is much below the reality. Any one acquainted with the coal localities, we think, will not object to the assumption, that one third of the whole commonwealth is pervaded with coal beds, and that these are over three feet thick. It would indeed be nearer the fact to say they average above six feet thick .- Phila, Aurora.

SWINE.

An Ohio Farmer recommends coals as useful in fattening hogs. After giving his hogs a small quantity daily, say two pieces to each, about the size of a hen's egg, they discontinued rooting, were more quiet, and appeared to fatten faster .-He omitted the coal a few days and they commenced rooting; he gave it again, and they ceased to root. He supposes that the coal corrects the morbid fluid in the stomach which incites them to root deep in search of fresh earth. Hogs in summer should at all times have water in which they can wallow, and they will encrust themselves with a coating of mud, so as to prevent their being troubled with vermin.

WEANING LAMBS, &c.

The weaning of lambs should be effected about this time, or when the lambs are from six weeks to two months old. At this age they should be taken from the ewes, and have the best of pasture during the first fortnight; by the end of which time they will be so much accustomed to living on grass that they may be turned into a poorer pasture. It is important that the lambs when weaning should have a good bite of fresh grass, otherwise their growth will receive a check which no subsequent management can overcome. Where they have grazed with their dams so long as five or six weeks little bindrance to their growth will be sustained by the separation. The ewes should be removed to such distant pastures or other places as that their bleating may not be heard by the lambs. There is, however, one cau- may need recruiting by some kind of manure. In

pasture, which is to let them be in some degree disorder occur the distempered animals should be treated as directed, page 334 of our current volry to milk their dams several times, in order to relieve their udders, which otherwise sometimes become swollen and painful.

The worst wooled lambs, bad colored ones, and "nent services in that office; and that the Society those that are very small, should be made over to the butcher, and need not be weaned. It is be rendered unnecessary, which ought at least to recommended, however, not to kill or sell for be avoided in meadows, (or pastures) appropriated killing any lambs till they are about six months for the feeding of dairy cows, from its affecting old, at which time their fleece becomes valuable.

"Those ewe lambs, which are intended for try is so poor.

time of the new moon in July. Their fleeces will nure, according to long approved practice. But a vield as much the next year, and the wool will be better; and as cold storms rarely happen at that it immediately after the first mowing when a sectime of the year, the lambs will do better without ond crop is expected, which will undoubtedly be their fleeces than with them.

GRASS LAND.

By lying, is apt to become uneven and knobby. To prevent this, good farmers pass a roller over their land every spring and fall. This gives the roots of grass a more equal advantage for nourishment and growth, facilitates the mowing of the grass, and the raking of the hay.

When land becomes bound, or its surface matted together by interwoven roots of grass in such lis, most generally dress their lands in autumn .a manner as to lessen the crop, if it be not convenient to plough it up, it should be cut or scarified by a spiked roller; or if the farmer do not it may be added, that it is a season of greater possess this, by a heavy loaded harrow, when the leisure, and although it is confidently asserted compost, composed of materials which will not for the protection afforded by the top dressing, soil. There is no danger of destroying the roots vents evaporation? Whatever principles of ferof the grass by harrowing. Though they be brokbe more plentifully formed, and the crops will rise with renewed vigor.

As a general rule, dung, or the recrements of animal and vegetable substances cannot be profitably applied to land which is covered with a thick sward. The sun, the atmosphere, and the neighboring streams of water in such case become hay, generally adopt the practice of fall dressing the recipients of nearly all the fertilizing particles of manure thus applied. When grass land becomes impoverished by repeated crops of hay being taken from it, the soil should, as a general rule, be ploughed, and manure applied to the arable crops, such as potatos, Indian corn, mangel wurtzel, &c. and when thoroughly subdued, and in the northern states) Herd's grass, which grew made abundantly rich, it should again be laid on the farm of Mr Jeremiah Crosby, of Billerica, down to grass, with great plenty of grass seed.

too moist or too stony for arable crops, and yet duce such samples of fertility.

tion to be attended to in turning lambs into a rich such case, light dressings, such as soot, coal-ashes. peat, or wood-ashes, lime, malt-dust, &c. &c. are satisfied with food, previously, that they may not often highly beneficial. Sir John Sinclair says, be surfeited or hoven or swollen. Should this "as there are strong objections to the application of pure dung to grass lands, (much of its strength being evaporated, from its being exposed to atume. On weaning the lambs, it may be necessa- mospheric influence) composts are greatly to be preferred. They may be applied at the rate of from thirty to forty cubic yards per acre. To keep grass land in good condition, a dressing to this amount is required every four years. The application of unmixed putrescent manure, will thus the quality of the milk."

It was remarked in Deane's N. E. Farmer, that stock," according to Deane, "should not come at "it is ridiculous to think of taking many crops of the rams. For if they have lambs at a year old, it bay from any piece of upland, in uninterrupted stints them in their growth; and they have so lit-succession, without affording it any manure. For tle milk that their lambs commonly die for want it does not imbibe the richness of the atmosphere of nourishment. Or if they chance to live, they so plentifully as land in tillage. Grass land should, will be apt to be always small. This practice is therefore, once in two or three years at least, have one reason why our breed of sheep in this coun- a dressing of good rotted dung or of a compost, suitable for the soil. But the best way is to do it "The largest lambs should be sheared at the every year. Autumn is the time for applying mawriter in the Georgical Essays recommends doing the larger."

The last edition of the same work, under the head "Top Dressing," contains the following observations: "There is scarcely any question, on which farmers are more divided than as to the policy of applying manure as a top dressing to grass lands in spring or fall. The reasoning seems to be in favor of spring dressing, and it is supported by many excellent names. But it ought to be known that intelligent farmers, near the metropo-Besides the reason stated above that grass lands arc less injured by carting over them in the fall: ground is softened by rains or the coming out of that the manure is wasted by rains and snows, frost. It may then be dressed with some sort of yet much ought to be allowed on the other side, lose their virtue by exposure to the sun nor be to the tender roots of plants during winter; and easily washed away by rain; and harrowed again, ought we not to allow something for the low temso as to mix the manure with the surface of the perature of the atmosphere in winter, which pretility exist in manure, are in winter carried down en they will be speedily renewed; new offsets will into the soil. We are fully convinced that a scorching sun, and drying air, are more pernicious to manures, spread thinly over the surface than any drenching rains can be, unless on declivities, where top dressings are unquestionably of less value than on level grounds. The fact, that farmers, who grow rich by supplying great towns with grass lands, descrees weight."

were present his Excellency the Governor, the Secretary of State, and most of the dignitaries of the Commonwealth, C. P. Sumner, Esq. Sheriff of Suffolk gave the following toast:

"Agriculture,

In China's realm, from earliest days till now The well lov'd Emperor annual holds the plough. Here too, our worthiest candidates for tame, With unsoil'd honor, sometimes do the same; Upholding such, our generous yeomen's hearts Show a just reverence for the first of arts."

It is pleasing to observe that the culture of the ground, the heaven-prescribed employment of the first man, is still held in the highest estimation by our first men.

The Marblehead Social Society have passed a vote of thanks, and forwarded the same, to Rev. the Ancient and Honorable Artillery Company on prey to its indefatigable enemy. their 190th anniversary .- Salem Reg.

This discourse has had a most extensive circulation through the newspapers, in all parts of New England, and is worthy the perusal of every intelligent and reflecting man. We understand it has already passed through two editions, in the pamphlet form, of upwards of 5000 copies.

MAKING THE MOST OF LAND.

Capt. James Perkins, of Essex, Mass. raised, last season on an acre and a half of land, 72 bushels of Indian corn, 70 bushels of potatos, 70 bushels of winter apples, 80 bushels of turnips, 2 loads of squashes, and 2 bushels of beans. One third of the land alluded to consisted of gravelly knolls. In 1826 the whole was planted with Indian corn. Communicated.

The Hon. Stephen Van Renssellaer has established a School in Troy, designed to teach experimental philosophy, and its application to agriculture and the mechanic arts.

Nantucket sheep shearing .- The number of sheep assembled at the late shearing in Nantucket, was England. about 12000. The wool is worth from twenty to twenty-five cents per pound.

The corn field of Mr. Asahel Ives of this town as we are informed, was attacked not a great while since by an army of Crows which in the space of a few minutes destroyed 2,400 hills of corn .- Berkshire American.

ELDER BERRY WINE.

Recipe .- One bushel, when picked from the stalks, produces three gallons, or upwards, of berries-put these to seven gallons soft water; after standing forty-eight hours, put them into the copper, let them boil one hour, then press the juice through a coarse cloth, then put the liquor into your copper again, with twenty pounds of raw sugar, half a pound of Jamaica ginger, bruised, one ounce of cloves, and one ounce of allspice .-Boil the whole together one hour-then put it into a tub, and when cold enough, add some good barm or yeast, spread on a toast, and in two days, put it all into a cask, and lay the bung lightly on for two months; then add one quart of brandy; this wine will keep, if required, several years.

Royal Relic .- The mace belonging to the Roy-At the State celebration of the late anniversary at Society was the gift of King Charles the Secof American Freedom, held in Boston, in which oud, and is the identical one pointed at by Oliver Cromwell when he said, "Take away that bauble!" on the memorable occasion of his dissolving the Long Parliament.

> "Oh Love! what may thine emblem be!" A skein of yarn across a tree.

Two young ladies recently divided a skein of varn and hung themselves on a tree near Palmyra, Ohio, and "all for love." Before life became extinct they were discovered and restored.

From Foreign Journals.

ENORMOUS SPIDERS.

In the Brazils, the spider reaches an enormous size, with different habits from those of Europe. It stretches its web from tree to tree, and no longer appears a solitary insect; many hundreds live together, and form nets of such strength, that you may often see a bird of the size of a swallow, quite foot beating two others. John Pierpont, for delivering his discourse before exhausted with struggling, and ready to fall a

COLOUR OF SOILS.

An experiment which I have often repeated upon light as well as tenacious soils with like success, demonstrates how greatly the color of a soil influences the accumulation of heat. Coal ashes were sprinkled over half the surfaces of beds sown with peas, beans, &c. and on these the plants invariably appeared above ground two or three days earlier, obviously on account of the increased warmth; it being a well known fact, that dark colored bodies absorb caloric more readily, and in larger proportions, than those of a lighter hue.

FRENCH SOUPS AND SAUCES.

A French cook is indebted for his delicious sauces, entirely to the produce of the kitchen garden. Ginger, Cayenne pepper, and the host of hot exotics, which in England render the palate a fiery furnace, are wholly excluded from French cookery. Wine, oil, butter and bouillon, (stock) form the basis of all soups and gravies: which are flavored with herbs from the garden. French HOG'S LARD, first sort, new, cookery may therefore be pronounced extremely PLAISTER PARIS retails at healthy, instead of the reverse, as is supposed in PORK, new, clear, -

** An article on the manufacture of Soda will soon appear.
Also, an article from Lynn, on the canker worm.

Oat Meal, Oat Flour, Grotts, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine bolted Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few cannisters of fine Oat Flour, neatly packed, at 50 ets. per cannister.

" Bleaching Powder."

For sale at the New England Farmer Seed Store, the Bleaching Powder described on the first page of this week's paper, by Professor Webster of Harvard University—by the pound or cwt.

From the Legendary.

THE EXILE AT REST.

BY THE REV. JOHN PIERPONT

His falchion flashed along the Nile; His hosts he led through Alpine snows ; O'er Moscow's tower, that blazed the while, His cagle flag unrolled-and froze.

Here sleeps he now, alone !-not one Of all the Kings whose crowns he gave, Beads o'er his dust ;-nor wife nor son Has ever seen or sought his grave.

Behind this sea girt rock, the star That led him on from crown to crown Has sunk ;-and nations from afar Gazed as it faded and went down.

High is his couch; the ocean flood Far, far below, by storms is curled; As round him heaved, while high he stood, A stormy and unstable world.

Alone he sleeps! the mountain cloud, That Night hangs round him, and the breath Of morning scatters, is the shroud That wraps the conqueror's clay in death.

Pause here !- The far off world at last Breathes free; the hand that shook its thrones And to the earth its mitres cust, Lies powerless now beneath these stones;

Hark! comes there, from the Pyramids, And from Siberian wastes of snow, And Europe's hills, a voice that bids The world he awed to mourn him? No:

The only, the perpetual dirge That's heard here, is the sea bird's cry-The mournful murmur of the surge-The cloud's deep voice-the wind's loud sigh.

Fog .- A London fog is a sad thing, as every inhabitant of London knows full well; dingy, dusky, dirty, damp-an atmosphere black as smoke, and wet as steam, that wraps around you like a blanket; a cloud reaching from earth to heaven; a palpable obscure, which not only turns day into night, but threatens to extinguish the lamps and lanterns, with which the poor street-wanderers strive to illumine their darkness dimming and paling the ineffectual fires, until the volume of gas at a shop door cuts no better figure than a hedge glow-worm-and a dutchess's flambeau would veil its glories to a will-o'-the-wisp. The very noises of the street come stifled and smothered through that suffocating medium,-din is at a pause-the town is silenced, and the whole population biped and quadruped, sympathise with the dead and chilling weight of the out-of-door world. Dogs and cats just look up from their slumbersturn round, and go to sleep again; the little birds open their pretty eyes-stare about them-wonder that the night is so long, and settle themselves afresh on their perches. Silks lose their glosscravats their stiffness-hackney coachmen their out of temper -- masters scold -- servants grumble, don fog is the most detestable. - Lon. Mon. Mag. | perfectly dry and well preserved .- Him. Gaz.

Ghost Story.—The Springfield Republican states that the people in the neighborhood of Mount Tom, in West Springfield, have been troubled on account of a babbling ghost, which some work- Thus, swine are poisoned by pepper seeds, which men pretended to have seen in the night. One man said that he had not only seen the ghost, but conversed with it, (although it had no head,) and that the headless form informed him that he was the ghost of Timothy Felt, who was murdered a-

It is strange that any portion of the community should be so stupidly ignorant as to credit for a moment any stories about ghosts, witches, and hobgoblins. When will such delusions cease?-Hampshire Gazette.

Loading Hay in Chili .- A writer in the Christian Spectator, who has spent several years in Chi- a very fine olive. It is formed of innumerable ligneli, (or Chile) remarks that almost all substances ous fibres, interwoven together, and is as supple from the earth and sea, are transported on the and as tough as whalebone. They are sometimes back of mules in that country. Hay is wholly found eighteen inches long in the Red Sea; and brought to market in that way. A man mounts are eagerly sought by the women of America for his mule and stands erect, while a second throws fans. In some instances these plants are found him up bundles of long green hay, which he pla- of a very beautiful red, or variegated, when of ces round him as our hay-makers load a cart .-When the mule is so laden that nothing but his long cars and the owner's head are visible, he is brought to the city, where the rider sells to one and another until his load is gone.

Long sticks of timber are brought to market on mule-back, one on each side of the animal. They are crossed and lashed two together on the saddle; the lower ends drag on the ground behind, and sweep the whole street.

The editor of the Reading Journal says that he has tried the experiment of pouring boiling water upon the roots of a Peach tree, the leaves of which had become sear and dry, and the limbs in a rapid state of decay-"in one week it begun to revive, and in three weeks it was covered with a new foliage, and new vigorous shoots are putting out, in all directions."

If this is the case, the joke cracked upon Mr. Triptolemus Yellowly's young orchard, in Scott's novel of the Pirates, loses all its point : and in a future edition, it would be well for the author to to give that matter a new turn.

To make molasses beer .- Take five pounds of molasses, half a pint of yeast, and a spoonful of powdered ginger-put these into a vessel, and pour on two gallons of scalding hot soft watershake the whole till a fermentation is producedthen add of the same kind of water sufficient to fill up your half barrel. If the cask be greater or smaller than this, the component parts must be in proportion. Let the liquor ferment about twelve hours-then bottle it, with a raisin or two in each bottle.—Farmer's Assistant.

Large tree.—The largest tree in the world is said to be the Adansonia digitata, which is found in Schegal, Egypt, and Abyssinia. The trunk is from 20 to 30 feet in diameter, and divides into way; young ladies fall out of curl, and mammas branches of great size, which spread out drooping at the extremities, and form a mass of verdure 150 and the whole city, from Hyde Park corner to feet in diameter, and 70 feet in height. The wood Wapping, looks sleepy and cross, like a fine gen- is light and soft, and the negroes sometimes holtleman roused before his time, and forced to get up low out chambers in the trunk, and deposit their by candle-light. Of all detestable things, a Lon- dead within them, where they become munumies,

Difference of Constitution .- Substances that are poisonous to one tribe of animals are medicinal to a second, and even highly nutritive to a third .to man are a serviceable and grateful spice; while henbane roots, which destroy mankind, prove a wholesome diet to swine. In like manner, aloes, which to our kind is a useful medicine, is a rank venom to dogs and foxes; and the horse, which bout three years ago. The people turned out to is poisoned by the water hemlock, and corrosive find the bones of Timothy Felt, but did not dis- sublimate, will take a dram of arsenic daily, and improve thereby both in his coat and condition. N. Y. Farmer.

> Marine fans .- In the bed of the Red Sea, and on some parts of the coast of America, there grows a very curious marine plant, which is flat, and spreads very much like a peacock's feather. Its color, in general is tawny, but some are found of course their value is greatly increased.

Indelible ink, for marking on linen cloth, &c. is made by dissolving one drachm of lunar caustic and half an ounce of gum arabic in half a pint of pure rain water. Previous to using it the cloth to be marked should be wet with a preparatory liquor made by dissolving one drachm of salt of tartar in half a gill of rain water, and thoroughly dried and ironed .- American Adv.

It is estimated that there are 60,000,000 gallohs of lamp oil used every year in the United

Turnip Seed, &c.

Just received at the New England Farmer Seed Store, No. Just received at the New England Farmer Seed Store, No. 22 North Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the present season—the finest sorts either for fannly use or stock. The most improved sorts for the former are the White Strone, White Dutch, Yellow Stone, Yellow Maltar. The Yellow Stone is one of uncommon excellence and keeps well. Of the sorts for field editure, the White Norfolk, White Globe, and Yellow Abverdeen or Bullock are preferable. The Yellow Abverdeen is most approved among the farmers of England and Scotland, as it grows to a large size, is very sweet and nutritions, and keeps till June. Also, Yellow Ruta Baga, or Russian Turup, of the best description. The above seeds were saved in Europe exbest description. The above seeds were saved in Europe ex-pressly for us, and the numost dependence may be placed upon their gennine quality. A variety of Long and Turnip Radish-es, suitable for growing the three ensuing months. Prickly or Fall Spinach, Long Prickly and Early Cluster Cueumber; also the genuine Girkin Cueumber, or West India pickling one of the finest pickles.

the muest prexise.

Likewise 200 lbs. fresh common white flat English Turnip
Seed, a part of it the growth of 1828:—to dealers and purchasers by the quantity, it will be put at a low rate.

Also, genuine Fowl Meadow Grass, from Vermont—Orchard

Grass, Lucerne, &c.—Hemp, White Mustard, Flax Seed, &c.
At this place is kept the best supply of seeds, native and imported, that art and industry can procure.

July 4

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West interciants, masters of vessels, and others trading to the West Indies, cao be furnished with boxes of Seeds, asserted, suitable for that market, at from \$4 to \$5 per hox.—Each box centains upwards of sixty different kinds of seeds, vegetable and ormental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound of holder all wavented garden. land, by the pound or bushel, all warranted pure, and of the growth of 1827.

Bremen Geese.

For sale, 10 pair fine Bremen Geesc. Apply at the New England Farmer Seed Store. July 4.

Published every Friday, at \$3 per samum, payable at the end of the year-but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by John B. Russell, at No. 52 North Market Street, (over the Agricultural Warehouse) .- Thomas G. Fessenben, Editor.

BOSTON, FRIDAY, JULY 18, 1828.

No. 52.

DOMESTIC ECONOMY.

FOR THE NEW ENGLAND FARMER.

A METHOD OF PROCURING FRESH WA-TER PURE AND WHOLESOME.

(Translated from the French.)

Mr. Fessenden,-The process which is here proposed is not wholly unknown to scientific men; but it may be useful to publish it for the benefit of those, who reside in places, where the water is not of the best quality. The method is to make use of pulverized charcoal, which has the properter. The water of sewers, the most foul, and of marshes the most muddy, may be rendered as clear, and agreeable to the taste, as that of the best fountains, by filtering it through a few inches of charcoal dust. Many persons perish, annually, during the warm season, in consequence of using foul and putrefied water.

Any person can afford to purchase a half cask, and adopt to it a wooden cock, with a false, movable bottom, and five or six cents worth of charcoal. Sailors, also, may provide themselves with casks, prepared by this method, by which means they will be able to supply themselves with good

water, during a long voyage.

I believe that an industrious man, might, (in many situations) find his account in purifying water in this manner, as the process is simple, and the apparatus costs but a trifle.

With esteem, yours, A. PARMENTIER.

Botanic Garden, Brooklyn, New York, July 7, 1827.

FOR THE NEW ENGLAND FARMER.

CANKER WORMS.

Mr. Fessenden,-The desolating ravages of for the energetic exertions of agriculturalists and have been attempted to stop the progress of the grub while attempting to ascend the fruit trees. tar, has, the last season, been found to be com- Magazine. pletely successful in this town, where properly and faithfully applied. Several fine orchards, (which the preceding seasons exhibited the appearance which marks the progress of these destructive insects) are now clothed with luxuriant verdure and fruit; while orchards immediately adjacent which have not been tarred are completely divested of sures of any particular species of food, particularfruit and foliage.

successful, was to encircle the trees with a bandage of cearse cloth and apply the tar on the cloth every evening about sunset. In the morning the tar was found to be full of grubs and millers. The tarring was attended to in the preceding fall as well as in spring, many of the grubs were caught in November, and in February; and it is found that they ascend at all times after the first freez- their full content. I first commence with the beet, ing, when the ground is sufficiently thawed to al- because it is most perishable; carrots then follow, of Spanish asses, resembling the zebra in appearlow them to extricate themselves. This, no doubt, had some effect; but these insects are so amazingly prolitie, that, if only a few as- my milk is as rich as the milk of cows not thus cend, the tree is injured.

I had formerly supposed, that some other method would be found to be more expedient and ef- ly keep them till they are aged. If the proposifectual than tarring; such as, perhaps, putting tion stated in the extract at the head of these relime about the roots, or tan, clay, or sea-weed, or removing all the soil from around the trees to a ty of attracting all the products of vegetable and distance and supplying its place with such as was ble, that I should never have remarked the ill of animal decomposition, held in solution in the wa- not infected with the deposits of the worm. I feets stated, had also supposed that tarring, taking into consideration the trouble, expense, uncertainty and of less weight, as coming from a man not bred a the injury of the tar to the trees, would be nearly equivalent to a total loss. .But I am now convinced that the canker-worm may be exterminated by this method, and that the cause of failure hitherto has been, that the grab has stolen a march upon in the autumn and winter.

Certain it is, if the canker-worn should continue its ravages many years, some of our finest orchards will be entirely ruined. Thes considerations have induced the foregoing remarks from

Lynn, July, 8, 1828.

A FARMER.

From the Massachusetts Agricultural Repository.

RAW POTATOS BAD FOR MILCII COWS. The following article taken from a foreign magazine, has been copied lately into the American Farmer and the New England Farmer:

"Many farmers are in the habit of giving raw potatos to all kinds of stock; but they are of a watery and griping nature, and accidents have frequently happened from their use, before the cattle have been accustomed to them. For milch cows, they are very bad, purging them, and rendering their milk too thin and poor, even for suckthe canker-worm in various parts of the State, call ling. If given raw to fatten oxen, good hay and bean meal should be allowed, to counteract the orchardits, to destroy them. Various experiments watery quality of the roots. There is, however, much difference in the nature of potatos, and the mealy approach nearest to the nature of corn, the Encircling the bodies of the trees with a rim of yellow afford the strongest nutriment."-Scotch

REMARKS.

Nothing can be of greater importance to every farmer, than a correct knowledge of the comparative merits of the different varieties of food for his cattle. Of course nothing can be more pernicious, than throwing out loose and general cenly of those most easily raised, and therefore the The method pursued by those who have been cheapest. I certainly am not disposed to set up my authority against opinions advanced in established works. But there is no treason in stating facts, in relating careful and long continued experiments. For nearly twenty years, I have been in the practice of allowing my milch cows from November till they go to grass about three pecks of roots a day with good English, or upland hay to

mildness of the weather has made it necessary to be for a few days relaxed; so they will, (often) to In some instances, they have also dug up the use, they return to their natural state of body, and

Potatos, then, cannot be a watery, griping food; managed. My cows have been almost always raised by myself, from my own stock, and I usualmarks had been true, or nearly true, or had any degree of soundness in it, it seems to me impossi-

Some farmers may consider these remarks as farmer. Some may suppose that I trust the eyes of others, and am deceived. To these possible objections, I reply, that my cows are objects of special regard, as furnishing me with one of the most valuable luxuries; that I attend to them personally and carefully, and I can see no good reason why an attention of twenty years should not enable me to form as correct an opinion as a thorough bred farmer. I am not, bowever, without support from persons of that description. An intelligent practical farmer, whose dairy is in such repute that he obtains from thirty-one to thirtyseven cents a pound for his butter, assured me, that he always gave his cows in winter the long red potato in a raw state, and that be estimated two bushels of that potato for his cows as equal to JOHN LOWELL. one bushel of corn.

CURRANT WINE.

Extracts from the Report of Messrs. Bartlett & Harvey to the Rockingham Agricultural Society, at a Cattle Show, held in Exeter, N. H.

The samples of wine exhibited, were of white and red by Mr. Samuel B. Stephens of Exeter; and of red, by Joseph Tilton, Esq. of Exeter .-The wine from the white current, for body and flavour, was preferred; and the committee award to Mr. Stevens the premium. This wine had no distilled spirit mixed with it, and was made by the following receipt:

"To each gallon of clear juice was added two gallons of water, and to each gallon of the mixture was added three and a half pounds of white Havana sugar, and put immediately into a clean wine barrel; after it had done fermenting it was bunged tight."

The red wine of Mr. Stevens was made by the following receipt.

"To each gallon of clear juice was added two gallons of water, and to each gallon of mixture was added three and a half pounds of good brown sugar and put into good barrels; after it bad done fermenning, it was stopped tight. In February after it was made, one gallon of the best 4th proof Cogniae brandy was added to each barrel, and stirred up thoroughly."

A late London paper states, that the duke of Buckingham has, at his seat at Avington, a team son has been particularly unfavorable; -for the tos. In commencing with the potatos, they will freely to the collar than any of the native species,

Extract from a Treatise on Agriculture, originally published in the Albany Argus.

RYE.

This grain, though of the same family with wheat, is less valuable. A bushel of rye weighs less, and gives less flour, and of worse quality, than a bushel of wheat. In comparison, therefore, with wheat, it fails; still there are circumstances, which, as an object of enture, may give it the preference: 1st. It grows well in soils where wheat cannot be raised: 2d. It bears a much greater degree of cold than wheat: 3d. It goes through all the phases of vegetation in a shorter period, and of course exhausts the soil deal of pasture, without much eventual injury to the crop: 5th. Its produce, from an equal surface, is one sixth greater than that of wheat .-These circumstances render it peculiarly precious to poor soils and poor people-to mountains of great elevation and too high northern latitudes.

Its use, as a food for horses, is known as well in this country as in Europe. This grain chopped and the straw cut and mixed, forms the principal horse food in Pennsylvania; and in Germany, the postillions are often found slicing a black and hard rye bread, called "bonpournikle," for the post and other horses; and the same practice prevails in Belgium and Holland.

Its conversion into whiskey, is a use, less approved by reason and patriotism; but if a spirituous liquor must be drank, we have no scruple of a bad practice, as lead may sometimes be dissolvpreferring the form of whiskey, (of our own mak- ed by the acid of the milk, and then it is poisoning) as that, which, on the whole, is least injurious to the human body and most beneficial for the body politie.

two—the black and the white; for spring rye, coagulating the new milk, before the cream; for Pennsylvania, which is the high or head wood land (often mistaken for a species) is but a variety, pre-cream will not rise, after the milk has become coduced by time and culture, and restored again agulated. to its former character and habits, by a similar

humidity.

Rve is not exempt from the attacks of insects: but suffers less from them than either wheat or milking. The last half-pint of milk that can be barley. Whenever the straw of winter rys be- got, by milking the cow dry, contains as much comes yellow, shining, and flinty, and circulates cream as the first quart, or perhaps three pints; no more juices, nature makes the signal for har-and, for this reason, cows ought always to be vest, and no time should be lost in obeying it milked as clean as possible. The quantity of "Cut two days too soon, rather than one day too cream will also be greater, if the milk of each late," was among the precepts of Cato; which, if | cow be strained into a pan by itself, as soon as adopted here, would save much grain-terminate possible. The practice of pouring the milk of the harvest about the tenth of July, and give a the cows together, while milking, and letting the bundant time to turn down the stubble, and sow whole stand till hearly cooled, is a very bad one, the erop next in succession.

Slave Mongers .- E. Malibran, of New York, has lately been fined in the sum of \$2,000 as having having the cream separated by the scalding profitted out a vessel called the Science, for the African slave trade, which vessel was some time since sent into New York and condemned.

SILK.

ns great pleasure to find some of our enterprising eitizens already engaged in the nurture of silk four or five beautiful cocoons, made by silk worms lest degree of boiling mars the process. on his farm the present season. Capt. Wright has set out a considerable number of mulberry trees, which are doing well; and he will soon have abundance of means for trying the experiment of silk making on an extensive scale.

One or two others, we understand, have emless: 4th. If sown early in the fall, it gives a great barked in the same enterprise, but how extensively, or with what success in the outset, has not been told us. Our husbandmen would do well to follow this example generally. If an acre of land put into this liquid, a part of it turns immediately will support mulberry trees enough for the pro- into butter. In London, this cream is considered duction of forty pounds of silk, annually, and this is said to be the case, our farmers will find this city from a distance of two hundred miles.—Farone of the most profitable uses to which their dry, sandy lands can be appropriated .- Mass. Yeo.

CREAM.

Pans or trays for holding milk, to raise the most cream, ought to be broad and shallow, and the milk put in them should not be more than three or four inches in depth. 'Tin and wood are the best materials for making these.

Some line wooden trays with lead; but this is ous. Wooden trays ought to be well scalded, and dried in a cool place, as often as new milk is put into them, to prevent the wood from absorb-The species of this grain, cultivated here, are ing too much of the acidity of the milk, and thus shire, the highest land in England, called this

If new milk be kept as warm as when it comes from the cow, no eream will rise on it; but, when According to the course of crops, potatos, in a sufficiently cooled, the cream separates from the sandy soil, precede rye. The ploughing, harrow-rest and rises to the top. In order then to effect ing, and manuring given to that crop, will there- this, to the best advantage, the new milk should fore make part of the preparation necessary for be made as cool as possible, and the cooler it is this. After harvesting the potatos, plough the thus made, the more suddenly and effectually the ground and sow and harrow in the rye, taking cream will rise. The cooler the cellars in which care, as in all other cases, that the seed he core- milk is kept, the better. To set milk-pans, made fally selected and thoroughly washed in line wa- of tin, in beds of salt, would, no doubt, be useful, ter, as the means best calculated to prevent the where the cellar is too warm; and to set all milk ergot; a disease, to which it is most liable, and vessels on a floor which is constantly covered with which is supposed to be an effect of too great cold spring-water, is also an excellent plan; and, where it can be done, ought never to be omitted.

Most of the cream comes last from the cow in as in this way, much of the cream will not afterwards rise.

It is is said, that any given quantity of milk, eoss we shall describe, yields a fourth more of butter; and it is well known that this eream may be churned into butter in two or three minutes.

The milk is kept twenty-four hours-it is then Since we have commenced epitomizing the put into a vessel over a small fire, which should "Manual" on the cultivation of silk, it has given only be sufficient to raise the heat of the milk, nearly to boiling, in two hours, not less. When it has been this length of time heating, and begins worms, and making-preparations for an extensive to exhibit indications of being near boiling, by attention to the production of silk. Capt. Anthony bubbles rising to the surface, it is to be taken off, Wright, of this town, showed us, a few days ago, and let stand twenty-four hours more. The smal-

> At the end of this time, the cream will be all on the surface. It is then to be divided into squares, with a knife, and taken off from the milk beneatli. This cream will keep much longer, without souring, than cream raised in the common way; and may be, at any time, quickly converted into butter. It may also be salted, and used on bread, or otherwise, without churning.

> It is good for coffee, but not for tea; as when a great dainty, and, in winter, is sent into that mer's Assistant.

PENNSYLVANIA.

William Penn the founder of this State, in one of his letters to his friend Richard Turner, gives the following account of the origin of the name given to the State.

"5th 1st mo. 1681. This day my country was confirmed to me, under the great seal of England, with large powers and privileges, by the name of Pennsylvania, a name the king would give it, in honor to my father. I chose New Wales, being as this, a pretty health country; but Penn, being Welsh for a head, as Penmanmoire in Wales, Penrith in Cumberland, and Penn in Buckinghamfor I proposed, when the secretary, a Welshman, refused to have it called New Wales, Sylvania, and they added Penn to it; and though I much opposed it, and went to the king to have it struck out, and altered; he said, it was passed, and he would take it upon him-nor could twenty guineas move the under secretary to vary the name; for I feared, lest it should be looked upon, as a vanity in me, and not as a respect in the King, as it truly was to my father, whom he often mentions with praise."

A bet of a snit of clothes was recently made that a pair of P. G. Nagle's patent water proof boots, would resist water for 24 hours. A tub was filled with water to the proper height and the boots placed in it, under the inspection of a gentleman in whom both parties had confidence. At the close of the last hour a large concourse of citizens assembled to witness the result. The boots were taken out of the water at the appointed time a piece of paper which had been placed on the inner sole was found perfectly dry, and upon thrusting the hand into the boots not the least feeling of dampness could he discerned. The bet was paid. N. Y. Dai. Adv.

Boston and Hudson River Rail Road .- The Engineer for the Western Railway, and one of the Directors, are now engaged in extending the survey which ascends the Westfield River, and along that river to the boundary line of New-York. The portion which lies within New York will be surveyed under the direction of the Commissioners of

REMEDIES FOR INDIGESTION.

In indigestion, two of the most prominent features are flatulency and acidity; and the remedies for these states are clearly indicated. They are the alkalies and magnesia; and the advantages which the latter in the general way possesses over the former, is this: that as containing an alkaline principle, the stomach acidity is neutralized by its administration; and a purgative suit being formed, in some measure, by the combination, the double purpose is thus effected of a corrective and an aperient. A tea spoonful or two of magnesia, thrown into a glass of water, and taken before going to rest, will often anticipate as it were the acid formation in the stomach, which would be otherwise consequent upon a little irregularity of eating or drinking; and will destine the individual to a good, who would pass a restless uncomfortable night .-When a more positive purgative is required, it will be right to combine the sulphate of magnesia (epsom salts) with the carbonate (common magnesia.) Two large tea spoonfuls of the former, with one of the latter, will constitute a good aperient; and for a gouty invalid, one tea spoonful of the fluid carbonate of ammonia (sal volatile) will be found useful; or, if the habit be cold, two or three spoonfuls of tincture of rhubarb may be advantageously mixed with the salts and magnesia.

Unwins on Indigestion.

THE SEASON.

Extract of a Letter, dated Kentville, June 29th, 1828 .- The country is looking beautiful; the crops generally promise well-the roots of the grass were somewhat injured by the frost last winter, owing to the scarcity of snow, but as the season has been so wet, but little inconvenience will be experienced from this circumstance. Potatos are full as forward as is necessary; wheat and oats bid amply to reward the efforts of the farmer; and many fields of Indian corn are highly promising; green peas will be gathered here in a few days; and strawberries are already ripe on the high lands .--- Halifax Recorder.

THE RED RASPBERRY.

"The manner in which nature cultivates the common red raspberry, so abundant in this Province, must convince any thinking person that toos plant could never have been produced by any co- can be had in every town. But it may be worth alition of Dr Darwin's Atoms. This plant, it is while to state, that a common five gallon keg may well known, thrives only in a very light soil; such be converted into a good one, thus: Char it ina soil it finds in perfection whenever our forests side; make a false bottom three inches from the are killed by fire; the raspberry immediately true one; bore it full of holes; fix your cock besprings up, and bears abundantly for two or three tween the two bottoms; on the false bottom lay a which many of the trees were two hundred years mortar, or melted wax and sifted brick-dust. old, and where, as the soil was very poor, the turf Water kept in well charred casks, will seldom tom of the turf, the seeds of raspberries, about kept in sheet iron vessels.

one to every square inch; they were apparently sound on the outside, but not more than one to a a strong solution of alum; into a gallon of water, hundred had the kernel sound.

SUMACH.

"I have observed in clearing ten or twelve acres of land upon a beech hill, that plants of Sumuch appeared in a circle about every fire-place where wood or bushes had been burnt, about one to the square foot; none appeared elsewhere. The largest trees on this hill were about two hundred years old. The Sumach is never found in an old grove of wood.

THE CHERRY.

"I have observed that a considerable part of the cherry kernels which grow after a fire, had been deposited by mice in small heaps, in situations where they were partially secured from rain. The mice appear also to be the principal agents in supplying our best hardwood hills with raspberry seeds, as these hills are rarely exposed to fires, except after a hurricane, they probably have often stood secure for a longer time than this seed can keep sound; but I have almost always found, upon cutting the hollow branches off a large rotten hearted birch, a considerable quantity either of seeds or shells of the seeds of the rasperry, if mile; they are deposited there by a mouse with a white belly, and very large cars, fringed with

"About many of the lakes near Halifax, where the land is but little above the level of the water, there is a remarkable Dyke or Mound along the edge of the lake; it is usually from four to ten feet thick at the base, and rises from two to four feet higher than the land back of it; it is princinally composed of stones, and covered with moss and trees; somewhat similar banks on the sea shore would lead to the conjecture that it was the effect of a hurricane, but upon observing the smallness of the lakes, and the size of the stones, it would seem to require a force of wind almost beyond conception. A sample of this may be seen at the south end of Lake Loon, on the Pres-From the papers of Mr Titus Smith, published in the Novascotian. ton Road, about three miles from the Ferry, where such a Dyke extends, according to the best of my recollection, for about half a mile."

FILTERING MACHINES.

These machines are now so common that they years; the effect of the burning and of the decay- piece of flannel; on that, a layer of well washed ing of the fibrous parts of roots being by that time sand, which should be fine and quite clean; let at an end, the soil becomes hard and cold, the this fill half the tub; on this a layer or rewraspberry perishes, a young growth of firs, or dered charcoal, with a piece of flannel to separate other trees spring up, and the ground is again it from the sand; on the charcoal, about a third covered with, a forest, which stands perhaps for of the space from the top, a leaden cover with an other fire, and a proper soil again formed for the close the lead cover all round the edge with ceraspberry, which would be seen there no more ment, so that no water can pass but through the maining unburt in the earth, without vegetating, sponge-second, through charcoal-third, through for the length of time that usually occurs between sand, and is drawn out clear by the cock between two of these periods. In a grove of spruce, of the false and true bottoms. The cement may be

was about a foot thick, I have found near the bot- putrify. On board the English men-of-war, it is

Water may also be purified thus: Have ready put five grains of pearl or potash, and stir it, then put in about three tea spoonfuls of the solution of alum; it will be beautifully transparent in about four hours, and perfectly wholesome,

For present use filter your water through clean blotting paper in a common glass or tin funnel. Domes. Ency.

THORN HEDGES.

I observed in the American Farmer, vol. x. No. 15, the following inquiries which I will endeavor to reply to:

"What is the best kind of thorn for hedges, then cost per rod, where can they be purchased, and what is the best season to plant them?"

I am most in favor of the kind called Washington or Virginia thorn. Ten years ago, having heard a favorable account of this kind of thorn, I planted a hedge about forty rods long, which is now a complete fence against cattle and hoge, without any wooden fence, and is a great ornament to the estate, and with a little attention, will be everlasting.

From the effect of this experiment, Sinclair & Moere, Pratt-street wharf, Baltimore, are raising there were any growing within a quarter of a largely of the quicks of this kind of thorn-and have them two years old, very thrifty, and well grown. Price five dollars per thousand-lower, it many thousand are taken. The quantity necessary per rod may be calculated, allowing them six inches apart in the hedge. The best seasou for planting is late in the fall, or early in the winter, especially on mellow soils; but early in the spring is also a good time, and best on stiff wet land. The quicks can be also purchased of J. Peirce, near Georgetown, District of Columbia, American Farmer.

Drinking cold water .- Several deaths have been occasioned, at and near Baltimore, by drinking cold water during the hottest part of the day; the consulting physician of the Health Department of that city has communicated to the Board an interesting paper on the subject. The writer, (Doctor Jameson) adopts the suggestions of Dr. Rush, and recommends his mode of treatment in cases of danger. It is mentioned that sudden death seldom ensues from this cause when the thermometer is below 85; and that other liquids, such as beer, punch, or toddy are sometimes equally fatal, when taken while the body is extremely warm. The symptoms are thus described: "In a few minutes after the person has swallowed the water, he is affected by dimness of sight-he staggers in attempting to walk, and unless supported, falls to the ground-be breathes with difficulty, and a rattling is heard in his throat-his extremities become cold, and be dies in four or five minutes." The only certain remedy, says Dr. Rush, is laudanum;-from a tea spoonful to nearly a table spoonful, administered immediately; and where more than a century before it is destroyed by an aperture; in the aperture put a piece of sponge; this is not accessible, a glass of whiskey or brandy may be given.

With due precaution, however, the alarming were it not provided with a seed capable of re-sponge; it will then percolate, first, through the effects resulting from an immediate draught of cold water may be avoided. Let the drinker first rinse his mouth, and cool his throat by degrees. suffering only a small quantity to pass down at once; or immerse his hands and face. It is the sudden opposition of the internal temperature to that on the surface, in these instances, that occasions spasms, obstruction, and death .- Bos. Bull.

From the Laneaster Gazette.

COFFEE.

Amongst the many subjects of investigation, in this age of improvement, we are glad to perceive that those things which contribute their share in strewing the path of life with flowers, and in stealing from care many a moment of our lives, viz. : "those things which are good for the nourishment of vanished sweets," for your own particular use. of the body" receive a due share of attention; but notwithstanding this it is wonderful to perceive how many in these days, despising the light of science, are still content to follow the customs which have been handed down from generation to generation until their origin has become lost in the mist of ages; who never take thought how those things which they are daily preparing for their comfort or luxury could be made better: who go on from day to day in the same path which them and regard any deviation from it as a sacrilege; who denounce every thing that is new only because it is so, and without testing it by experi-

There is perhaps nothing amongst the luxuries of the table which is so generally spoilt by this negligence or willful ignorance, as coffee, than which, when it is well prepared, nothing is more delicious and refreshing, and when ill managed, more flat and insipid; it is, in fact, as Ben Johnson describes matriniony,

> Like Jeremiah's figs, When good 'tis very good indeed, When bad not fit for pigs

To the lovers of it then, (and who that has ever tasted its invigorating flavor, is not) every investigation which will lead to any improvement in its preparation, will be interesting; for this reason we hope we shall be pardoned for the length of the following extracts upon this subject.

"If you have ever seen a pot of coffee boiling over a strong fire, you may recollect what a fine odour was spread over the house,-most delightful to the smell, and giving " note of grateful preparation" to every eye and palate which may prefer its rich, warm, brown color, to the thin watery appearance of green tea. How woeful, then, must the disappointment be, after all this anticipated enjoyment of a delicious treat, when you find the coffee in your cup-brown enough indeed, and thick enough,-but tasteless, mawkish, and weak; the flavor and spirit all gone, and nothing remaining of the real stuff, save the shadow, which mocks the lip and palate with "unreal sceming,"-a flat, flavorless, "baseless fabric of a vision;" the very corpse of a cup of good coffee-more likely to plunge you deeper in drowsiness than to stir you up into renewed life.

It would be very hard, however, to blame the coffee, if you spoil it in the making-and the best coffee that ever grew in Arabia and Berbice, will be totally spoiled if you are barbarous enough to boil it. Think for a moment, and common sense will tell you that the fine odour floating in the air, all over the house, must have come from the coffee, and you could not have the conscience to expect an odour in the air and flavor in your cup at the same time. In one word, the best parts of the coffee, namely its fine strong flavor, and sleepbanishing aroma, are so spiritual and airy that boiling drives them off instantly, and what remains in the pot is the mere dregs and refuse-heavy, heartless and thick-fit only to be thrown to the pigs or the dunghill.

We dislike all dogmatism, and ask you not to ue to form the principal of them on sugar and wattake this on trust : we have no wish to set up our er. authority in opposition to facts. Try it and learn wisdom by experiment and experience. It would but it is impossible that it should ever be too frabe better, indeed, to give your hard earned pence grant. The very smell of it is reviving, and has to the poor, than thus to waste them on the thank- often been found to be useful to sick persons, and less air, by filling it with all the strongest and best parts of your coffee, and leaving only "the ghost

But if we are not to boil our coffee, because it we then to do?" You recollect that the doctor, who was asked a similar question, replied, "Take advice." So say we. Be advised by us, and you to, than either its bitterness or astringency. This expense of those who foolishly hoil it.

if you cannot afford five, six, or seven shillings for, and at the same time losing much of its flavor," their grandfathers and grandmothers trod before this you must give up the idea of coffee till you can; for it cannot be made either good or cheap without. You will lose more money in a few weeks, by hoiling your coffee, and wasting it in the air, than would buy you such a pot, which would last you for years. Your coffee is to be put into the upper strainer, boiling water poured over it, and as soon as it has run through, it is progress in the interesting science of which the ready. If you do this rightly, it ought to be as clear and high-coloured as brandy, and of a fine strong flavour; that is supposing you use a mixture of one half Mocha or Turkey coffee, and one half Berbice or Bourbon, which is better than tention to the science which describes them, and either singly. You must not forget, also, to boil a proper consideration of the particular items the milk (cream if you have it) which you put with your coffee, for cold milk or cream will spoil the desirous of obtaining all the localities not describbest coffee ever prepared.

"The roasting of the berry to a proper degree, requires great nicety. If it be underdone, its virtues will not be imparted, and in use it will load and oppress the stomach; if it be overdone, it will seminated—the associated minerals—and the rock vield a flat, burnt, and bitter taste; its virtues will be destroyed, and in use it will heat the body, and act as an astringent. The closer it is confined at may be mentioned. the time of roasting, and till used, the better will served.

"The influence which coffee, judiciously prepared, imparts to the stomach, from its invigorating qualities, is strongly exemplified by the immediate effect produced on taking it when the stomfrom inanition.

"Du Four relates an extraordinary instance of the effect of coffee in the gout; he says, Mons. Deyears of age and had it severely until he was upthe gout.

"A small cup or two of coffee immediately after dinner promotes digestion.

" With a draught of water previously drunk, according to the eastern custom, coffee is serviceable to those who are of a costive habit."

The generality of the English families make their coffee too weak, and use too much sngar, which often causes it to turn acid on the stomach. Almost every housekeeper has a peculiar method of making coffee ; but it never can be excellent, unless it be strong of the berry, any more than our English wines can be good, so long as we contin- lent provision.

Count Rumford says, "coffee may be too bitter, to those who are afflicted with the head-ache. In short, every thing proves that the volatile, aromatic matter, whatever it may be, that gives flavor to coffee, is what is most valuable in it, and should wastes all the best of it, "what," you will ask, "are be preserved with the greatest care, and that in estimating the strength or richness of that beverage, its fragrance should be much more attended will have excellent coffee, at least for one half the aromatic substance which is supposed to be oil, is extremely volatile, and escapes into the air with In the first place, then, you must buy a Rum- great facility, and is observed by its filling the room ford coffee pot, or biggin, with strainers in it; and with its fragrance, if suffered to remain uncovered,

Phillips' History of Vegetables.

NEW EDITION OF CLEAVELAND'S MIN-ERALOGY.

Prof. Cleaveland, of Bowdoin College, is preparing a third edition of his valuable work on Mineralogy and Geology. This indicates a steady book treats. The mineral riches of a country are of vast importance to its prosperity. To be of the greatest use, however, they must be thoroughly known; this can be effected but by a strict atwhich serve to make up the whole. Prof. C. is ed in his last edition. A letter from him says-

"I wish to connect with the account of the Locality some brief Geological notice, viz: whether the mineral occurs in veins, or in beds, or is diswhich contains them. In most cases, the form, structure, and prevailing colour of the mineral

"I also wish to obtain as accurate information, its volatile pungency, flavor, and virtues, be pre- as possible, in regard to all minerals explored for useful or ornamental purposes, such as Nitre, Common Salt, Marble, Marl, Gypsnin, Precious Stones, Steatite, Roof Slate, Clays, Pigments, Anthracite, Graphite, Coal, Ores of the metals, Perphyry, &c. and also certain articles manufactured from minach is overloaded with food, or nauseated with erals, such as Alum, Copperas, Chromate of Lead, surfeit, or debilitated by intemperance, or languid &c. The quantity of the aforementioned substances annually obtained or manufactured, the quality including the per cent. of metal yielded by ores, and the price are particularly requested. NEW SPECIES OF PINE.

Mr Douglas writes: "I rejoice to tell you of a new species of Pinus, the most princely of the genus, and probably the finest specimen of American vegetation. It attains the enormous size of from 170 to 220 feet in height, and from 20 to 50 covery, but this is obvious. in circumference. The cones are from 12 to 18 inches long! I have one which is 161 inches in length, and which measures 10 inches round the thickest part. The trunk is remarkably straight, and destitute of branches till within a short space of the top, which forms a perfect umbel. The wood is of fine quality, and yields a large portion of resin. Growing trees of this species, that have been partly burned by the natives, to save the trouble of cutting other fuel, (a custom to which they are greatly addicted,) produce a substance, which, I am almost afraid to say, is sugar; but as some of it, with the cones, will soon reach England, its real nature can be easily and correctly ascertained. The tree grows abundantly 2° south of Colombia, in the country inhabited by the Umptqun tribe of Indians. The seeds are gathered by the natives in autumn, pounded and baked into a sort of cake, which is considered a luxury. The saccharine substance is used in seasoning dishes, in the same manner as sugar is in civilized countries. I shall bring home such an assemblage of specimens of this Pinus, as will admit of a very correct figure being made, and also a bag of its seeds."-Brewster's Journal.

LARGE GEESE.

We vesterday saw in a wagon a pair of young geese, raised by James Sisson, Esq. of Warren, of very large size, being now only three months old. The breed was imported from East-Friesland last fall, in the ship North America, Capt. Child, who asserts that these geese frequently grow to upwards of twenty pounds, dressed. They are very full of soft fine feathers, which is an article of exportation frem that country, and very much sought for in Germany, Holland, and England. These geese are the first of this breed which has ever been imported into the United States, were brought especially for Mr. Sisson, and are well worthy the attention of the lovers of good eating. Mr. Sisson has a few pairs on hand, which he will dispose of at \$12 the pair-and will send them to any part of the country he may be directed .- Prov. Pat.

The following is extracted from the London New Monthly Magazine for March, under the head of Useful Arts.

"Glue made water proof .- A correspondent informs us that he has succeeded in making a Glue perfectly water proof, and having the property, also of drying almost immediately after its application. His method, we learn, is first to immerse common glue in cold water until it becomes perfectly soft, yet retaining its original form; after which it is to be dissolved in common raw linseed oil, assisted by a gentle heat until it becomes entirely taken up by the latter. After which it may be applied to substances for adhesion to each other, in the way common glue is ordinarily applied. It dries almost immediately, and water will exert no action on it. It is unnecessary to say in how many valuaused. For cabinet makers it is important, as mahogany veneers, when glued with this substance, will never fall off by exposure to a moist atmosphere. In ship building it will probably answer a what he cannot buy.

valuable purpose, as it has infinitely more tenacity than common glue, and becomes impervious to water."

Note .- The author might further have adverted to the advantage arising to Hatters from the dis-

On Tuesday the 8th inst. a stroke of lightning descended upon the eastern wing of the Tontine Coffice-house, in New Haven, breaking through the roof, and making its way through the upper tier of rooms, leaping from nails to wires, and marking the intervals by rents in the plastered walls, until it made its exit through the opposite side of the building. Several persons were slightly benumbed, and others stunned by the shock.--There are three lightning rods rising several feet above three of the chimnies on this building, and it is matter of speculation and wonder among many that the electric fluid should break through the roof within seven or eight feet of one of the lightning rods. Some gentlemen of much study and observation, contend that in this instance the electricity was conducted to the roof by the steam pickle and limed; a 4th sown without any preparaand smoke which was beating down upon the reof after it had risen several feet above the top of the chimney. It is a fact that the lightning struck the roof near the kitchen chimney-and that there was a powerful fire in the kitchen below at the time .- New Haven Reg.

Vegetable Inoculation .- It is mentioned in the London Mechanics' Magazine, that there is a blotched-leaved variety of the English laburnum, out liming. B. had never prepared his seed by a bud of which being inserted in the bark of the any process. It was found on harvesting the crop (whether the bud lives or not) of making the leaves of the latter blotched, like the parent stock of the bud. "If" says Mr. Falla, "the blotched or striped leaves of the plants arise, as I think is generally admitted, from a disease, this may justly be considered as virulent a disorder in the vegetable world, as the small-pox is in the human race, and this operation may very fairly be said to be inoculation."

A Marriage Tree, generally of the pine kind, is couple in the parish of Varallo Pombio, in the Tyrol; a fine grove of pines is said to shade this the ground from the extreme cold which often pine of the Tyrol claims to be ranked as a fruit tree, as well as valuable timber, being the Pinus pinea, the kernels of the cones of which are fre- fertilizes the soil, and causes a strong rich sward; quently served up in the dessert in Italy, and the Southern Alps, as almonds and nuts are in Eng- of manure. land .- Gar. State of Education in Lower Canada. - The petitions presented to parliament from the Canadas complaining of the Administration of the Earl of Dalhousie, contained the names of 78,000 persons, of which only nine thousand are signatures, the other 78,000 having his mark attached to them. The population of Lower Canada is 450,-000 French to 80,000 British. Only one in eight of the former are taught to write.

We are ruined, not by what we really want, ble purposes in the arts this application may be but by what we think we do; therefore, never go abroad in search of your wants-if they be real and manage and manure it as above directed .that buys what be does not want, will soon want yard to manure any vines that may dwindle or not

From Memoirs of the New York Board of Agriculture.

ON LIMING SEED WHEAT.

Sir,-In answer to your inquiry on the subject of smut in wheat, I will state to you what has fallen under my observation.

When I resided in Seneca county, several years ago, my attention was particularly drawn to this subject, by observing, that while myself and neighbors were much injured by smut in our wheat, the crops of Mr. C. uniformly escaped. I enquired into the cause of this singular exemption, and learnt that it was owing to the seed having been limed.

In 1816, therefore, I washed my seed, put about three pints of lime to each bushel, mixed it well, and let it lie in a heap twelve hours before sowing. My crop was perfectly clean, while I can say all my neighbors had more or less smut.

In 1817, part of my seed was washed and limed as in the preceding year; another part was washed and limed, and a pint of salt to each bushel mixed with the line; a 3d parcel was washed in strong tion. The result was as follows: The first had a little smut, the second none, the third none-and the fourth was a quarter smut-all on the same kind of land, and all sown in good weather, between the 5th and 15th September.

In 1819, Mr. L. bought his seed of my neighbors Mr. B. and Mr. G. and of myself, and sowed all without preparation. Mr. G's crep was from seed had of me the year before, and sowed withcommon laburnum, it has invariably the effect that the part sown with my seed was free from smut,-that sown with G's seed had a little,--and that sown with B's seed was one fourth smut .-This statement I had from Mr. L. I mention this circumstance to show that seed wheat well cleaned as mentioned, will have an effect for two or three crops; but I would never recommend to sow wheat without salt and lime.

As the Hessian fly has never yet troubled us ire Albany, I am unable to speck of the efficacy of preventing the ravages of that insect.

I beg leave to suggest to farmers, the proprieplanted in the church yard by every new married ty of spreading their straw upon their pasture grounds, either in spring or fall. It will shield church yard, and it must be recollected that the breaks the fibrous roots of the grasses. In summer it shields the ground from the searching rays of the sun, prevents the evaporation of moisture, and when ploughed, will be equal to a good coat JAMES McCALL. .

DISEASES OF VINES.

When you see a vine unhealthy, by the leaves becoming vellow, or other sickly appearances, remove immediately the earth from about the roots, and fill up the space with a compost made of lime. ashes, or cowdung, and vergin earth from the woods, well incorporated, and water the ground well. Sometimes the leaves turn vellow, and the vine seems otherwise diseased by there being too many grapes on it. If you wish to preserve your vine, remove the grapes or cut down the branches to near the ground, leaving one or two young ones. wants they will come in search of you-for he. There ought to be a compost heap at every vinegrow vigorously .- Adlum's Treatise.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 18, 1828.

CLOSE OF THE SIXTH VOLUME.

The present number completes the sixth volume of our paper, and brings us to the termination of are made to approach nearer to its centre. six years since the commencement of our labors as Editor of the New England Farmer. We hope that our exertions have been of some service to they have been estimated as possessing some valto our subscription list, which continues to attend the progress of our publication. We would take this opportunity to make our general, but grateful acknowledgements to those contributors to our columns, to whom we are indebted for the most valand results of the experience of intelligent cultifavors.

what is due, and saving somewhat by an anticipated payment of the next volume. It is true, however, that money, though neither the mainspring, nor the main object of our pursuits, is what rhetoricians call a sine qua non, or thing indispensable to the existence of our establishment.

PRUNING TREES.

In Loudon's Encyclopedia of Agriculture, Kalendarial Index for July, it is remarked that "this season [viz. July] answers perfectly well for pruning all sorts of trees, and if their leaves and spray were an object for fodder, as in Sweden and Italy, no doubt it would be preferred. Wounds in trees do not now bleed as they semetimes do in spring and autumn, and they heal and are in part covered with bark before the approach of winter." scientific friend of the Editor, who is likewise a found by experience that the month of July is much the most favorable time for pruning grape may, therefore, not be ill timed to offer a few remarks on this important branch of arboriculture.

Mr Knight in his excellent " Treatise on the Culture of the Spple and Pear," has given the following directions. "In pruning the apple tree and all other standard trees, the points of the external branches should be every where rendered thin be published by J. B. Russell, Proprietor of the and pervious to the light; so that the internal parts of the tree may not be wholly shaded by the external parts. 'The light should penetrate deeply into the tree on every side, but not any where through it. When the pruner has judiciously executed his work, every part of the tree, internal as well as external, will be productive of fruit; and the internal part, in unfavorable seasons, will rather receive protection than injury from the external. A tree, thus pruned, will not only produce disc on the culture of Grape Vines and the Straw-ings over the ordinary expences is estimated at much more finit, but will also be able to support a heavier load of it, without danger of being broken; fer any given weight will depress the branch. not simply in proportion to its quantity, but in the compound proportion of its quantity, and its horizontal distance from the point of suspension, by a mode of action similar to that of the weight of the beam of the steel yard; and hence a hundred and

fifty pounds, suspended at one foot distance from quainted with the subjects on which they have the trunk will distress the branch, which supports it, no more than ten pounds at fifteen feet distance would do. Every tree will, therefore, support a which is superadded to a Calendarial Index, givlarger weight of fruit without danger of being ing directions for performing the work of all the broken, in proportion as the parts of such weight months in the year as they follow in succession.

" Each variety of the apple tree has its own peculiar form of growth; and this it will ultimately assume, in a considerable degree, in defiance of the community, and are induced to believe that the art of the pruner. Something may nevertheless be done to correct whatever is defective.--ue from the constant, though not rapid accession When the growth of any variety is weak and reclining, the principal stem should be trained to a considerable height, before it be allowed to produce branches; and if any of these take a horizontal or pendent direction, they should be regularly taken off. One principal leading stem should uable parts of our paper, (being generally details be encouraged almost to the summit of the tree, to prevent a sudden division into two large boughs vators) and would solicit the centinuance of their of nearly equal strength; for the fork which these form is apt to divide and break, when the branch-It is not necessary to observe that the close of es are loaded with fruit. All efforts to give young a volume presents a favorable time for the settle-trees a round and regularly spreading form, whilst ment of accounts, at the Farmer office-paying in the nursery, will be found injurious in the future stages of their growth. Large branches should rarely or never be amputated."

If, however, pruning is commenced at a proper stage of the growth of the tree, and properly and seasonably attended to, it will rarely be necessary to take off a large limb, and small ones, if cut close and smooth, may be taken off at any season. See N. E. Farmer, vol. iii. page 273.

EXCELLENT ARTICLES.

We have received a quantity of OAT FLOUR, very white, fine, and sweet, and very palatable as well as wholesome for puddings, gruel, &c. Like- | The work is handsomely printed, making a volwise groats and oatmeal of superior quality, all ume of 312 pages,-price \$1.25. raised and manufactured by Mr Stevens, of Barnet, Vermont. These articles have been highly approved of by several druggists in this city, by Dr Kidder of Charlestown, and other qualified practical horticulturist, assures us that he has judges, who pronounce them to be preferable to any thing of a similar nature imported. They appear to contain more mucilaginous, and less bitter vines for at this season large brauches may be cut extractive matter than the common preparations off, and the vines will not bleed in the least. It from oats, found in the shops of druggists and

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and practical Horticulturalists in the vicinity of Boston and New York, will New England Farmer, in the course of the ensuing week. The articles are arranged alphabetiomically cultivated in the climate of New England, 1s. the pound. and the Middle States; as well as a Treatise on FLOWERS, and on LANDSCAPE OF PICTURESQUE GERRY .- The article on Fruit Trees contains an \$2,179. numeration and description of all the Apples, articles is furnished by gentlemen practically ac- went oil, was \$15-the highest, 135. Vegetables .- Hartlib, (the friend of Milton) pensioned by Cromwell for his agricultural writings, says, "that old men in his days remembered the first gardeners that came over to Sursey, England, and sold turnips, carrots, parsnips, early peas, and rape, which were then great rarities, being imported from Holland. Cherries and hops were first planted in the reign of Henry Sth; artichokes and currants made their appearance in the time of Elizabeth; but even at the end of this latter period cherries were brought from Flanders-onions, saffron, and liquorice, from Spain, and hops from the low countries. Potatos, which were first known in England about the year 1586, continued for nearly a century to he cultivated in gardens as a curious exotic, and furnished a luxury only for tables of the richest persons in the k ngdom." It appears in a manuscript account cally, and comprise the most useful Vegetables of the household expenses of Queen Anne, wife and Faurts which can be conveniently and econ- of James 1st, that the price of potatos was then

Each of the above was sold. The lowest price at which any animal Dexter, formerly of this city, now residing at Whitesborough, N. Y. near Utica, we understand was the largest purchaser .- Boston Courier.

MAIMING.

We are no friends to the system of docking and nicking of horses, dogs or cats. To clip off at one " fell swoop," five or six inches of the vertebræ is, in our opinion, an act of eruclty, and descrives the severest reprehension. Nature created a horse, a dog, and a cat with a long tail, and in doing which evidenced her taste and judgment, and to mend her perfect work is nothing but a ridiculous and barbarous custom. The Berkshire American has an article upon this subject. The editor is speaking of the curtailing of dogs, and says:-- (Bellows Falls paper.)

"No sooner does a man bring home a puppy, than he falls foul of the poor creature at both ends -paring bis ears nearly to his head, and leaving him too little tail to express his gratitude (for thus mending him !) by wagging it. And this he does, as he says, to make the dog look farse and savage. And in fact, he not only succeeds in giving him a ferocious appearance, but in souring his temper for life; for the animal being, without any provocation, thus murderously treated, and divested of his fair proportions, become a misanthrope, instead of the good natured, friendly and affectionate creature he is always found to be when properly treated."

Sugar.-The manufacture of sugar from the beet, continues to flourish in France. It is stated that there are more than sixty manufactories for the purpose in that country. Three establishments of the kind were recently formed on a large scale.-N. Y. Journ. of Com.

Toads .- We are wont to regard the toad as noxious and useless, but it is because we do not observe the important uses which it serves in the animal economy. We lately noticed one of these creatures bloated to an enormous size, which had been feasing upon ants. Toads likewise devour flies .-- Salem Observer.

There is now in our office, (says the Trenton True American) a branch of rye, raised on the farm of Mr. Hunt, in this vicinity, containing forty stocks, of five feet six inches high, with each a large ear, all proceeding from one root, and the production of a single grain, exhibiting a most asionishing increase.

Long Wool .- A man in New Jersey has a slicep of the Dishley breed, which weighs 252 pounds ;some of the wool is 20 inches in length. A man in Pennsylvania, lately sheared 23 pounds of wool from one sheep; it is very fine, and some of it 12. inches long, (probably the growth of two or three years.)

Valuable Discovery .- An ingenious tradesman at Falkirk, has discovered a method by which he can mould skins and leather to any shape, and make very elegant light summer hats of sheep-skin, weighing 2 or 3 oz. varnished and rendered impervious to wet. He likewise makes them of seal skin with the hair on. Entire dresses, consisting of a jacket and trowsers, have been furnished to various ships' companies, at so low a rate as 15s each. They are of leather, dressed after a method which renders them impervious to rain, and yet as pliant as a glove.

We are happy to state, (says the New Bruns-) wick Gazette) that, notwithstanding the backwardness of the season, the crops in general wear an encouraging aspect; and it is highly deserving of notice, that the farmers throughout this part of the country have given evidence of their lively attention to the recommendation of last year, of the tea wheat, by having sown as much of that fine grain as circumstances would admit of.

In Charleston, S. C. there is a permanent and splendid Ice House, which has cost 15,000 dollars. is capable of containing the cargoes of four large ships; and notwithstanding the failure of the late winter in the north, it has been supplied with four cargoes of lesser size but quite enough for any possible demand.

Subscribers to the New England Farmer, are carnestly desired to settle all arrearages, either by remitting by mail, to the publisher in Boston, or by paying to either of the following Agents. Any who may wish to discontinue the paper, are desired to give immediate notice to the publisher .-Gentlemen who contemplate subscribing to the paper are reminded that the present is a favorable opportunity, as the next number will begin the 7th volume, which will be printed on new type, and no efforts will be spared by the Editor or Publisher, to make it at least equal to any volume that has preceded it.

MISCELLANIES.

THE MARRIAGE SCENE. [BY MONTGOMERY.]

"Young, chaste, and lovely-pleased, yet half afraid, Before you alter droops a plighted maid, Clad in her bridal robe of traintless white, Dumb with the scene and trepid with delight; Around her hymeneal guardians stand, Each with a tender look and teeling bland; And of she turns her beauty-bearing eye, Dimm'd with a fear of happiness goue by ! Then coyly views, in youth's commanding pride. Her uwn adored one panting by her side; Like lilies bending from the noon tide blaze. Her bashfol cye-lids droop beneath his gaze; While love and homage blend their blissful power, And shed a halo round his marriage hour; What though his chance-abounding life ordain A path of auguish and precarious pain; Ity wane or woc, where'er compell'd he rote, A cot's a palace by the light of love! There beats one heart which, until death, will be A gushing, glowing fount of sympathy; One frownless eye to kindle with his own, One changeless friend when other friends are flown; O! sanction Then the love-united pair, Fountain of love! for Thou art present there."

David Garrick was once on a visit to a Mr. Rigby's seat, Ministry Hall, Essex, when Doctor Gouge formed one of the party. Observing the potent appetite of the learned Doctor, Garrick indulged in some coarse jests on the occasion, to the great amusement of the company-the Doctor excepted; who, when the laugh had subsided, thus addressed the party: "Gentlemen, you must doubtless suppose, from the extreme familiarity with which Mr. Garrick has thought fit to treat me, that I am an acquaintance of his; but I can assure you, that till I met him here I never saw him but once before, and then I paid five shillings for the eight." Roscius was silent.

A downright Appeal-not a Hint .- We have scen a paragraph, taken from a Southern paper, and which is now travelling itself to death as fast as it can, stating that a gentleman lately deceased in Carolina, had never permitted Lis subscription to the newspaper to be behind, and that as the same could be said of so few men, is worth recording on his tomb stone. Verily, we say amen to this. This man stands next to him who returned paid me." How clear, too, must be the man's conyour pity or your pockets, we shall wait an answer Standard. by the return of mail. - Truth-Teller.

Scriblerus.-The following peroration to an elo- means so great as the superstitious crowd supposquent harangue addressed by a lawyer in Ohio, to les. But the same feelings which, in ancient

earth in darkness. All nature by wrapped in sel- levout prelate, lead men to cherish an illusion of subscribing, are cuitied to a deduction of infly cents.

einn thought, when these defendant ruffians came rushing like a mighty torrent from the hills down upon the abodes of peace-broke open the plantiff's door-separated the weeping mother from leys. But the inequalities of intellect, like the inher screeching infant-and took away my client's equalities of the surface of our globe, bear so rifle, gentlemen of the jury, for which we charge fifteen dollars.

The wise man has his folies no less than the fool; but it has been said, that herein lies the difference, the follies of the fool are known to the world, but are hidden from himself; the follies of periority. They are the first to catch and reflect from the world. A harmless hilarity, and a buoy- short time be visible to those who lie far beneath ant cheerfulness are not unfrequent concomitants of genius; and we are never more deceived, than when we mistake gravity for greatness, solemnity for science, and pomposity for erudition.

Ancient Coins .-- Mr. Stodder offers for sale a very valuable collection of antique Coins, which we understand belong to Mr. Purdie, a gentleman who has travelled through Greece, Asia Minor, and many of the principal cities of the eastern world, and who makes a short stay in this town, previous to his embarkation for Turkey.

Mr. P. has visited all the principal places where the Coins formerly circulated-being about 800 different varieties, some of them nearly 3000 years old, and undoubtedly the most valuable collection in the United States. Among them are many Egyptian and Roman coins, scarce and rare .- Prov.

Cultivation of flowers .- The cultivation of flowers as it is one of the most pleasing employments, so it is one of the most profitable. We do not mean profitable in dollars and cents, but profitable in its operation upon the habits of the world. The great purveyor of vice and the mightiest enemy of virtue is idleness. Want of employment takes men from their homes and causes them to loiter about taverns and grog shops. The same cause sends women from their families to spin street-yarn, and retail small scandal against their neighbors, who it is probable are better than themselves. What was at first done for want of occupation, at length becomes an inveterate habit, and the man cannot refrain from haunting the tavern, or the woman from flaunting through the streets. Learn your children to love the garden and to a borrowed umbrella! What higher praise can rear flowers. It will prove an useful exercise, there be, than have your printer say, "You always and an agreeable amusement. Turnip Seed, &c.

Turnip Seed, Scr.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the pressure season—the finest sorts either for family use or stock. The most improved sorts for the former are the White Stone, Who Dutch, Yellow Malta. The Yellow Stone is one of uncommon excellence and keeps well. Of the sorts for field culture, the White Norfolk, White Glube, and Yellow Aberdeen is most annived among the farmers of England and Scotland, as field culture, the White Norfolk, White Glube, and Yellow Abreviene or Bulkek are preferable. The Yellow Aberdeen is most approved among the farmers of England and Scotland, as it grows to a lang esize, is very sweet and autritious, and keeps till June. Also, Yellow Ruta Baga, or Russian Turuip, of the best description. The above seeds were saved in Europe expressly for us, and the utmost dependence may be placed upon their genuine quality. A variety of Long and Turaip Radistess suitable for growing the three ensuing months. Prickly or Fall Spinach, Long Prickly and Early Cluster Cucumber; also the genuine Girkin Cucumber, or West India pickling one of the finest pickles. finest pickles.

the finest pickles. Likewise 2000 lbs, fresh common white flat English Turnip Seed, a part of it the growth of 1823:—to dealers and purchasers by the quantity, it will be put at a low rate. Also, genuine Fowl Meadow Grass, from Vermont—Orchard Grass, Lucerue, &c.—Hemp, White Mustard, Flax Seed, &c. At this place is kept the best supply of seeds, native and imported, that art and industry can procure.

Roman.

This elegant, full blooded horse, a bright bay with black legs, nene and tail, of high spirit and good temper, will staod at the farm of Mr Stephen Williams in Northborough, Ms. at \$20 the season, to be paid before the mares are taken away.—See New England Farmer, May 16.

Oat Meal, Oat Flour, Grotts, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine bolted Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few cannisters of fine Out Flour, neatly packed, at 50 cts. per cannister.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New Eng-

HAYING.

MR FESSENDEN-I read in the last Farmer some directions for moving, from some of which, though sanctioned by general practice, I beg leave to enter my dissent. "The mower's work, you say, will not only be made easier by the coolness of the morning air; but also by the dew on the grass, which is cut the more easily for being wet."

I admit that the grass is cut with more ease when it is wet than in a dry state; but when the grass is wet, the ground is of course wet; and if the grass is thick and suffered to lie in the swarth it makes very imperfectly and slowly, and from its wetness is liable to lose its sweetness; as tea and all other herbs lose their sweetness or strength, by being steeped in water. Or if a person follows the mowers to spread the grass soon after it is cut, the ground upon which it lays is not soon dried; much care is requisite to separate all the wet locks; and to spread it completely; and much time and labor are employed without necessity; a matter of no small consideration direct rays of the sun but of the reflected heat from the ground. Like weeds cut down in a corn field it requires very little tossing about or as the English call it, tedding, and it retains its sweetness. So far then it is a very great saving of labor and a gain of time and of quality in the hay.

I am always anxious likewise to have my hay from dew or rain, is always in a degree injurious; it hurts its sweetness; but the moisture arising from the natural heat of the hay, is not prejudicial: but serves on the contrary, to forward the making of the hay, unless it is permitted to continue too long, or the heaps when in a green state may use the expression, to go on to the acetous have the farther advantage of finding the ground diploma. round it dry and warm early in the morning, which of the hay. Clover is always much better for being cured in part by salting. An old experienced farmer in my neighborhood, maintains, that it is course with much less labor.

think that there is some reason in them; and if to be contagious and likely to go through the whole you please, you may submit them to the agricul- stye; but this has not been the case with my swine. tural fraternity.

Essex county, July 17, 1828.

P. S. Sometime since I passed a farm near Boston, which I was told belonged to a gentleman, who had been a ship-master; and found his hay cocks at night covered with pieces of canvass, probably parts of an old sail, of a suitable size, painted with a coarse red paint and having weights in the corners to keep them down. They could have cost but little; if taken care of would last for years; could be thrown upon the hay with very little trouble; and fifty or a hundred of them on a small farm in such a capricious, or as the farmers say, catching season as this, would have proved of a utility much outweighing the expense

FOR THE NEW ENGLAND FARMER.

STAGGERS IN SWINE.

Mr. Fessenden .-- Within the last two years I have had six pigs of different ages attacked with a disorder, called the Staggers. Other persons in in the busy season of haying. My own wish my neighborhood have likewise suffered, and that therefore is never to cut my hay but when it is very severely in the loss of some large and valuaperfectly dry, and the ground not only dry but ble swine. The hog in this disorder is first obwarm; it has then the advantage not only of the served to be continually turning himself round or running from one part of the stye to the other; he soon becomes totally blind; refuses to eat, falls when the sun is clear and warm, it wilts at once; down and rolls upon his back in fits, which seem. by painful and before long commonly dies.

I inquired of a celebrated Cattle Doctor in my neighborhood, a very useful and well meaning man, if he knew the disorder and what was the cause and remedy. He replied that he was often put in cock at night though it may have been called to cases of this kind, and commonly lost half mowed very late in the day, and be quite green; his patients; that in fact he was seldom successprovided only, it is not wet. Wetness upon hay, ful. The cause of it, he said, to use his own expression, was pizun (poisoned) teeth, which might be known by being discolored. The only remedy he knew was first to insert his knife into the animal's neck just back of his ears up to the hilt and "drive in" a piece of garget root; then to cut a gash beginning between his ears down his foreare made too large. It must not be suffered, if I head and clean into the bone and then with a punch to beat out the poisoned teeth as many as fermentation. The best farmers, I believe, agree there might be. After such horrible cruelty as that clover-hay should be stirred no more than is this, it was no longer matter of surprise to me that indispensable, in order to save it-because of the half his patients died; but that any of them surloss of its most nutritious parts, the leaves and vived; and I wondered much at what medical flowers. By putting my hay in eock at night, I school such a gentleman could have received his

I myself at first lost two swine from entire ignois of great importance to the expeditious making rance as to what to do; but in one of the volumes of the Philadelphia Memoirs of Agriculture, (the Ist, I think) I found a direction to cut off the tail If we suppose each bird, on an average to devour and ears of the animal as the easiest way of bleedso with all hay; and he told me a few days since, ing him, and then to give him a strong dose of that he considered the cost of a bushel of salt to Castor Oil. I have followed these directions and every load of hay he put in his barn saved in his have then immediately turned the sick hog out of being able to house it so much sooner and of the Stye into the pasture, and in this way have suc- less than a million pairs of these birds are distribceeded in saving them. FOR THE NEW ENGLAND FARMER.

INSECTIVEROUS BIRDS.

Ma Fessenden-I have noticed in your New England Farmer several accounts of the ravages of the canker worm this season. And I am inclined to believe this insect, as well as some other ers, has been more numerous in the county of Essex this season than for many years. Now, Mr Editor, we are told by many people, we must tar our trees and do many other things to preserve our orchards from the ravages of the canker worm, which, after all, it avails but little. The insect increases in number yearly. But for my own part, I thing, were we to leave off wantonly destroying our small singing Bians, we should be less troubled with insects of all kinds. It is a fact well known to every naturalist, that small birds destroy an almost incredible number of noxious insects. The amiable and indefatigable ornithologist, ALEXANDER WILSON, who perhaps was better acquainted with the liabits of our birds than any other person, when speaking of the Sturnus Predatorius, or red winged black bird, which, by the way, is by our farmers considered the most mischievous of birds, says "their food in spring and the early part of summer consists of grubworms, caterpillars, and various other larvæ, the silent but deadly enemies of all vegetation, and whose secret and insidious attacks are more to be dreaded by the busbandman than the combined forces of the whole feathered tribes together. for these vermin the black-birds search with great diligence; in the ground at the roots of plants, in orchards and meadows, as well as among buds. leaves and blossoms; and from their known voracity, the multitudes of these insects which they destroy must be immense.

Let me illustrate this by a short computation. fifty of these larvæ in a day, (a very moderate allowance) a single pair in four months, the usual time such food is sought after, will consume upwards of twelve thousand. It is believed that not uted over the whole extent of the United States in summer; whose food being nearly the same, would swell the amount of vermin destroyed to intelligence and experience. My remarks are and the disease materially and for a length of time twelve thousand millions. But the number of young

same allowance for them as the old ones, their calculated to succeed as far north as we may reaslugs were entirely destroyed. share would amount to four thousand two hundred sonably expect vineyards to flourish in our counmillions; making a grand total of sixteen thousand try. I will merely further remark, that the great least eighteen inches long, so as to admit of contwo hundred millions of noxious insects destroyed distance up the Rhine, where these were obtained, siderable motion to the sieve. If these suggestions in the space of four months by this single species. caused their land transportation through France, shall be of any use, it will afford me the highest The combined ravages of such a hideous host of to amount to more than the original cost of the vermin would be sufficient to spread famine and vines. desolation over a wide extent of the richest and best cultivated country on earth.

All this, it may be said, is mere supposition. It is, however, supposition founded on known and acknowledged facts.

Mr. Bradley, in his General Treatise on Husbandry and Gardening, shows, "that a pair of sparrows, during the time they have their young ones to feed, destroy on an average, (every week) about three thousand three hundred and sixty caterpillars." This calculation he founded on actual observation. And it is well known that several kinds of our birds, such as the hirundo, muscicapa genera, and some others, feed entirely on insects.

I am fully persuaded, as long as farmers and others permit boys to roam over their fields and shoot down every small bird they meet-as long as young men are in the habit, on our anniversaries, of forming themselves into shooting parties, for the purpose of destroying small birds, which they do in immense numbers-I say as long as this wanton destruction of birds is carried on, we must expect imminerable hosts of noxious insects will continue to commit depredations on our orchards, our fields, and our gardens.

Yours, respectfully, Danvers, July 18, 1828.

FOR THE NEW ENGLAND PARMER.

THE VINE.

Mr. Fessenden,-I last autumn addressed a request to some gentlemen who have extensive vineyards on the border of the Rhine in the most northern department (Haut Rhin) of France and requested them to send me 6000 grape vines, comprising only those which were cultivated with the most ease and most success in their vineyards, and which were, there, fully to be relied on for abundant yield and regular crops. I applied to these gentlemen from a full conviction of their knowledge on the subject, they having been most successful cultivators of the vine in that northern locality; and also because in a long intercourse I have never been deceived by them, but on the contrary most honorably dealt with. In consequence of this application, I received in April last 6400 vines, which arrived in perfect order and were planted at my establishment here, where those who are desirous can view them. But the object of most importance is the selection of kinds made by them and which consists of the following.

> Auvernas blanc Facun or Bourger Gros Rauschling Petit Rauschling Hincseh Rothliehtner

It will be perceived that several of the above are German varieties, and it is a subject of gratulation that the two first enumerated, from which

birds may be fairly estimated at double that of to succeed so far north. From the particular in the middle of the day. Yours, most respectfully,

WM. PRINCE. Linnæan Botanic Garden, ¿ July 18, 1928

FOR THE NEW ENGLAND FARMER.

CANKER WORMS AND SLUG WORMS.

MR FESSENDEN,-These two destructive insects have again appeared in great numbers-to the great annoyance of farmers and gardeners; but with their return, there does not seem to have been a correspondent return of good sense, and practical skill on the part of many of the sufferers. I think that you could not render a more acceptable service to the public, than by republishing in your journal (without the plates) the two treatises of the late Professor Peck, on the canker worm and slug worm. Before I proceed to make any remarks or remedies, I would observe, that though the times of the appearance of these most destructive insects, are not as well fixed, as those of the locust, which appears statedly once in sixteen or seventeen years; and although I am aware, that no such law prevails, or governs the movements of the canker worm, and the slug worm, (having seen both in very small numbers during the whole interval since their last extensive ravages,) yet it is true, that the cauker worm and the slug worm have appeared but twice within my memory in great force, and we have no reason to doubt, that we shall again enjoy a long interval of peace fromtheir depredations.

Now as to remedies. I agree, cordially, with the most effectual, and the most certain remedy. but few years, are equal to any,) not one of which Legislature-I might say a thousand.

treated with lime, was infested with them.

Professor Peck observes, that the insects which tance would suffice.

I am not, however, confident on this subject-

This was effected by their parents, and as these are constantly fed on circumstances under which this importation was suspending on a long pole an old sieve filled with larvæ for at least three weeks, making only the made, I think the vines selected extremely well lime, and shaking it over the whole tree. The

> The sieve should be suspended by twine at pleasure. It should be recollected, that the slugs will re-appear the last of August.

JOHN LOWELL.

Roxbury, July 22, 1828.

N. B. I am much pleased with the POTATO Onion, procured at the New England Farmer Seed Store-I had them of full size ten days since, and their quality as an esculent is equal to any.

[Extract from a letter to the Editor of the N. E. Farmer.]

PEAR TREES.

"Have you any information of the existence of the disorder which prevailed for the two last years, and excited so much anxiety for the fate of the Pear trees? I have the satisfaction to observe that the cause, whatever it may have been, has ceased to operate in this vicinity. Our Pear trees look well, and although not remarkably fruitful, are thrifty, and throw out new wood in abund-W. J. Yours,

Plymouth, Mass. July 22, 1828.

From the American Farmer.

PRESERVATION OF PEACH TREES.

In your paper of the 6th of June, I observed one or two paragraphs upon the subject of the preservation of peach trees. If you esteem this luscious, and during its season incomparable fruit, as I do, you will not hesitate in rendering every aid towards its successful cultivation.

In addition to my orchard, I have about one hundred peach trees of different kinds, (and some your Lynn correspondent, that in tarring we have one or two which are natives of our village, and of Yet it is a very expensive remedy as it respects is at all injured by the worm, while many of my labor-and if other means can be devised less neighbors' are entirely destroyed. I can assure troublesome and as effectual, it would be worth a every one, that from my experience, no difficulty premium of five hundred dollars from the State exists, and the produce amply remunerates for every trouble. One of your correspondents re-During the last visitation of the canker worm, commends lamp or fish oil, and then boiling waabout 17 or 18 years since, Mr. Josiah Knapp, of ter. Both are right, although I should say that Boston, applied effete or slacked lime to the roots boiling water was a very doubtful remedy, and of his apple trees, which had been overrun the would require to be often repeated. Not long year before, and the insects disappeared. I pub since I saw a very fine peach tree in a perfect lished his letter in our journal, and tried the lime state of preservation. Although it had been sevon the greater part of my trees, leaving some eral years bearing, (it was in a small garden, the without the application. Every tree treated with reason of there being no more) yet the worm had lime was free from the insect-every tree not not injured it. Always anxious to learn every thing connected with agriculture, I inquired particularly with regard to its treatment, and was inrise in the fall and spring, rarely come from a formed that the lady of the family had directed greater distance than three or four feet from the the suds of soap after washing, without regard to stock-so that an application of lime to that dis- their being cold or boiling, to be thrown about the tree-and it had the desired effect.

The season is approaching when the insect but I think it worthy of extensive experiment. A commences its depredations. The season of its gentleman in Rhode Island has tried a circle of depredations may be fixed as commencing early tin with success. An account of it was published in July, and ending in September. Its greatest in your paper. Will you invite him to give a spc. ravages are during the month of August. It pencific description of the mode of application, and etrates the surface, and commences its depredaof the success? I have no doubt that a premium tion by boring the tree and depositing its egg would be given to him if it should prove effectual. about one to three inches below the surface. As to the slug worm, I had no difficulty what have read in works upon the subject, that the the celebrated Champaigne wine is made, are found ever in subdains it by shaking lime over the leaves bark is there more tender, which I presume is an. the tree. My method of prevention is this:

away the earth from about my trees, in size and been translated "The pressing of the milker bringin shape like a common wash bowl. The exca- cth forth milk." Jahn says "anciently butter was vation being about three inches deep next the not much used, but instead of it oil of olives. In tree, and six or eight in diameter. error, and that all bark of the root is equally soft, sometimes burned it in their lamps at their altars, large. If that is true, the same mode must be ses the insect to commence at that place. The butter is used in Genesis xviii. 8; Dent. xxii. 14; tected from the dew. Let clover once be socked with a heavy dew, after it has been wilted by the hatched and becomes a worm, which feeds upon xxix. 6; Isalah vii. 15; and Prov. xxx. 33. - Biblisun, and it is of but little value; the leaves drop, change color, and are lost, the stock becomes brew word translated butter signifies sour thick milk brown and tasteless; indeed, it will hardly combarn ; but secured from the dews and made by the wind and sun, it will be good hav, even a richness will be retained in the stocks, so that cattle or horses will consume the whole. In seasons of showers, you have the only security which is possible, by having your hay in cock, which, done as it ought to be, prevents it from receiving much damage; whereas showers upon hay, half made, and spread on the ground, nearly ruin it.

A small quantity of salt put on our hay, which

Our soil is good for grazing; cattle and beef are one of our staple exports; that our stock should The cream of the milk of the goat, ewe, ass, buf- be well wintered is of great importance, because it is always easy to make good beef from cattle of any description, which have been well wintered, and are in good order in the spring. Every farmer, therefore, who wishes to make money by his business, cannot pay too much attention to have his hay good, and his stock well tended, for there-

> Should it be objected, that to make hay in this manner, the hay makers would be out of employ towards the close of the day, the answer is, that having secured what has been cut in the morning, the mowers may proceed to cut the grass, because it ceases to wilt after the dew-fall, and consequently is not injured by lying open on the ground

> Could we but learn to make our hav as it should be, and abuse our working oxen less; not make them work excessively hard all day, and, at the same time, be continually branding them with a sharp iron, because they can do no more than their strength permits, we should find many more dollars in the pockets of our farmers, and the value of our stock nearly doubled .- Maine Patriot.

How to clear a House of Cockroaches .- Messrs. Editors,-Having been greatly annoyed by the noctural visits of these insects which appear to be cause I consider one ton of good hay of as much equally in want of food and clothing -- some of my value for feeding a stock of cattle, as two tons of family applied a remedy which succeeded so well, that I am inclined to mention it for the benefit of those to whom it is not already known.-Into a common bowl was put a gill or two of water, and made sweet with molasses. As the family were about to retire, this was set upon the kitchen hearth under and about which seemed to placed, one end on the hearth, in order to provide a passage to the water. The first night about 20 were taken; the second, more than one hundred: the third, about fifty; the fourth, about twenty;the fifth, seven; which, I believe has very nearly cleared my house of the nuisance. This remedy is so simple, and at the same time so effectual, that, hereafter no family need be troubled with cockroaches, unless they choose .- Col. Reg.

> [It might be well to add here, that this should serve as a caution against drinking water, or any liquid in the dark, as the same kind of weather,

HOG STY.

The ways of constructing these houses are various: But the best are those which are framed and boarded. The boards, that the swine may not gnaw them to pieces, should be of some harder wood than white pine, and they should be fastened with ribbings and spikes. Whatever be the constructure of sties, they should always have one part close and warm, with a tight roof over it; and the other part open, in which the trough is placed. Swine will not well bear to be wholly secluded from the weather and sunshine; and it is hurtful to them to have a cold and wet lodging; more hurtful than many people are ready to imag-

Although there should be a part of the sty, planked and boarded and warm, covered from rain and sun, and amply supplied with litter, yet the greater part of it should have no wooden floor .-The trough in which pigs are fed should be firmly fixed to the floor, so that they may not overset it, and it is very important that the divisions of a pigsty be so numerous, that pigs of nearly equal size and strength only should be permitted to feed together, otherwise the more powerful will exclude the others, and materially stint their growth.

The more comfortable hogs are kept, the less nourishment they require. The trough should be on the upper side covered with one or more lids. and upright pieces set before it at such distances that one log only can put his head between any two of them. If sixteen hogs are to be kept in the same sty, it should be thirty-two feet long and twelve wide, and the apartments should be so divided, that too many of the animals may not be forced to lie together. And it would, probably, be well to divide likewise the feeding apartment. Posts should be set up in the sty for the hogs to rub themselves. If thirty-two hogs are to be kept or fatted, perhaps the better way is to have two hog-sties of the dimensions last described, placed together with a roof over the whole, and a passage between them for the purpose of carrying food to the troughs.

The upper part of the sty, or some part of it may be appropriated to storing the different articles of food, which are wanted for feeding the animals, and it would be well to have a steam boiler afford a cover for forming a heap of composts with Medical Intelligencer. the dung of the swine .- Deane.

FOOD.

earth, and constituted his system in a manner suit- this dreary waste. able to partake, almost indiscriminately, of whatever is agreeable to his palate; and the injurious

dinner in this country, the too great freedom and frequency with which it is used, already affect the constitutions of the opulent, by those peculiar disorders which have been entailed on the descendants of the high bred families of Great Britain .-The gout was once a stranger in New England; but the luxury of modern days is preparing the way for a train of constitutional irregularities. which future generations can only regret, while they suffer its inflictions. To live long, live sim-

It is true, that animal food contains a greater portion of nutriment, in a given quantity, than vegetables, and in a proper state of preparation it tain in the year 1778, while stationed at Amboy, is best adapted for the immediate action of the absorbents of the chyle-poetic viscera; but the digestive functions of the human system become prematurely exhausted, by constant action, and the whole system eventually sinks under great or untaken once a day, and men would substitute for and pure water,-or a weak, fermented beverage the bowels in a laxative state. for the more deleterious potations of distilled liquors, we should see health walking in the paths ure to the dampness of the night air; and when that are now crowded with the bloated victims of necessarily exposed, the bowels should be more voluptuous appetite. Millions of Gentoos have carefully protected than any other parts of the lived to an advanced age without having tasted of body. The Egyptians, Mr. Dewer tells us, for any thing that ever possessed life, and been wholly free from a chain of maladies which have scourged every civilized nation on the globe; the from a high source, and deserve serious considerawandering Arabs, who have traversed the barren desert of Sahara, subsisting on the scauty pittance of milk from the half-famished camel that carried them, have seen two hundred years roll round, without a day of sickness.

The temperature of our food is an exceedingly important consideration. We are accustomed to take it too warm, forgetful of the fact, that artificial heat destroys the muscular tone of the stomach, vitiates its secretions and its physical powers, and induces painful and dangerous diseases of the liver. Let us take then another hint from the children of nature, who subsist on aliment of a temperature no higher than that of their own bodies, and who are generally hardy and long lived, until the simplicity of their habits is interrupted by least. This cider will retain its sweetness for beneath the same roof. If a part of the roof be the adoption of the vices brought among them by years, and be as clear as needful; it will be fit for made to extend considerably beyond the sty, it will the civilized invaders of their native forests .- Bost.

AMERICAN DESERT.

There is an extensive desert in the territory of Among those objects which immediately relate the United States, west of the Mississippi, which to health, there is no one more important, and less is described in Long's "Expedition to the Rocky regarded by individuals, than their aliment. It is Mountains." It extends from the base of the a mistaken notion, that one person requires an an-Rocky Mountains 400 miles to the east, and is imal diet, and another, whose avocation and hab-, 500 from north to south. There are deep ravines apply round your trees a hair cord, in the followits are different, a vegetable regimen; many of the in which the brooks and rivers meander, skirted ing manner, which will prevent the depredation of diseases originating in dyspepsia, the great endem- by a few stunted trees, but all the elevated sur- the Canker-Worm. ic of the Northern States, are induced by a habit face is a barren desert, covered with sand, gravel, of living too exclusively upon a few articles of food, pebbles, &c. There are a few plants, but nothing most of which are animal. Nature intended that like a tree to be seen on these desolate plains, and man should subsist upon the variety of bounties schoom is a living creature to be met with. The with which she has so liberally replemished the Platte, the Arkansas, and other rivers flow through the tree."

Catnip poultice, good for obstinate ulcers .- The effects of many articles of diet are to be attributed way to make a poultice of it, is to put it on in vin- As soon as the slightest symptoms of it appear to not so much their peculiar nature, as to the refine- egar, and boil it until it becomes soft, then thicken a flock, a handful of these berries should be given ments in cookery. Although the roast beef of Eng. it with bran, spread a little butter, that has no salt for every two sheep per day, and to be continued. land has become the magnum bonum of a good in it, over it, to prevent its sticking.

HOW TO AVOID DYSENTARY.

Rules which the celebrated Dr. Rush recommended for the prevention of this disease ;-He advises that spices, and particularly Cayenne pepper, and the red peppers of our own country should be taken with our daily food. Mr. Dewer,

a British surgeon, informs us that the French, while in Egypt, frequently escaped the diseases of the country, by earrying pepper with them to eat with the fruits of the land. Purging physic should also oceasionally be taken, as any medicine of laxative nature by preventing costiveness, will act as a preservative from this disease. A military cappreserved his whole company from the dysentary which prevailed in the army, by giving each of them a purge of sea salt; and some, ywars afterwards saved his family and many of his neighbors from the same disease, by distributing among interupted excitement. If plain animal tood were them a few pounds of purging salts. This disease was also prevented in an Academy at Bordentown, the various ragouts with which modern tables are N. J. by giving molasses very plentifully to all so abundantly furnished, wholesome vegetables the scholars, which had the effect of keeping

Another rule to be observed is to avoid exposthis purpose, tie a belt about their bowels, and with the happiest effect. These directions emanate tion. The facts adduced are striking, and should induce others to adopt similar measures for the prevention of this destructive disease .- N. Y. Obs.

CIDER.

Good eider can be made any where, of good fruit, by the following method: When your apples are well ground, wet your straw with the juice instead of water; put some straw in a cask next your receiving tub, with a blanket on it, to filtrate or strain it; then put it into a good clear strong cask immediately; suffer it to have as little air as possible, to prevent fermentation. When your eask is full bung it up tight, and remove it to your cellar, not to be disturbed for one month at bottling in four weeks. It should not be removed in the cask it was put up in, but racked into another. If there be any who doubt this mode, let them try one cask after the above method. The foregoing is certified from experience.

BENJ. WALDRON.

TO OWNERS OF APPLE ORCHARDS.

Save your tar for your carriage wheels; and

"Take cow or horse hair-let it be spun into cords of about two inches circumference, then take a pair of sharp shears or scissors, and clip off the ends of the hair upwards, and tie the cords round HORTICULTURE.

Rot in Sheep .- Dried Juniper Berries are a good antidote against this destructive epidemic .-until all apprehension is removed.

NETTLES.

Every body knows that the leaves of stinging At the bottom of this cavity lies a minute vessel borne along by the wind. or bag, containing a limpid liquor, which, upon the least touching of the prickle, is squirted thro' the little outlet, and, if it enters the skin, produces the mischief before mentioned by the pungency of its salts. Hence it comes to pass, that when the leaves of nettles are considerably dried by the heat of the sun, they sting but very little; whereas such as are green and juicy produce violent pain and inflammation.

OLIVE GATHERING IN PORTUGAL.

Towards the month of November, the olive arrives to that degree of ripeness which renders them fit for the annual operations. Like our walnuts, they are beaten from the boughs by means of long rods, while large cloths spread around the trunk, receive as many as fall within the space they occupy. The rest are gathered from the ground by women and children; and so great is the produce, that the entire population of an olive district find ample employment, in this work alone, for several weeks, although assisted by large groups who flock from a distance of nearly two bundred miles, to share the labor, and return with a little store of money thus earned, for their winter subsistence. Nothing can exceed the sprightliness of these olive gleaning parties; from sunrise to the all these classes when that supply is withheld, wheth- young folks a great treat. er by the immediate visitation of Providence, in smiting the earth with a blight, or the remorseless cruelty of man, in wantonly afflicting his fellows.

The crop of wheat and rye in Pennsylvania this season, is calculated to be double that of ordinary years. A great portion of the poorer sort of land is said to have produced nearly thrice the usual quantity. The rye straw, an article of consideration in the eyes of the farmer, has surpassed expectation as much as the grain .- Bos. Statesman.

AMERICAN VINE.

The expedition to the Rocky Mountains found nettles are thick set with sharp prickles that pen- on the borders of the Arkansas, near the eastern a cancer upon his nose, which has been treated etrate the skin when touched, and occasion pain, side of the great desert, hundreds of acres of the without succers by Dr. Fmith, of New Haven, and heat, and swelling, which symptoms were imagin- same kind of vine (vilis vinifera) which produces the ablest surgeons in the western country, has ed formerly to ensue from the prickles being left the wines of Europe. These vines were growing been cured in the following manner. It was rein the wounds they made. But the microscope in a wild state and were surrounded with hillocks commended "to use a strong potash, made of the discovers something much more wonderful in this of sand, rising to within 12 or 18 inches of the lye of the ashes of Red Oak bark, boiled down to common vegetable, and shows that its prickles are end of the branches. They were loaded with the the consistence of molasses, to cover the cancer formed and act in the same manner as the stings most delicions grapes, and the clusters were so with it, and in about an hour afterwards cover this of living animals. Every one of them is found to closely arranged as to conecal every part of the with a plaster of tar, which must be removed after be a rigid hollow body, terminating in the most stem. Those hillocks of sand are produced by a few days, and if any pretuberances remain in acute point possible, with an opening near its end, the agency of the vines, arresting the sand as it is the wound, apply more potash to them, and the

ENGLISH COTTAGES.

Travellers speak of the neatness, convenience and beauty of the cottages of the English farmers peeping out from among the green trees, and festooned with the woodbine and honeysuckle. The pride of the husbandman beyond the waters, exhibits itself in gathering around his habitation those ornaments, which are at once useful and elegant, attended with but slight expense and af- PRESERVE SHEEP FROM THE GAD-FLY. fording large revenues. > To take spots out of silk, linen, or woolten .- Take spirits of turpentine twelve drops, and the same quantity of spirits of wine -grind these with an ounce of pipe-maker's clay, and rub the spots therewith. You are to wet the composition when you do either silk, linen, or woollen with it; let it remain till dry, then rub it off, and the snots will disappear. True spirits of salts diluted with water, will remove iron moulds from linen-and sal ammoniae, with lime, will take out the stains of wine. - American Farmer.

CANCER.

Mr. Thomas Tyreil, of Missouri advertises that plaster again, until they all disappear; after which heal the wound with any common salve." Cautery and the knife had previously been used in vain. This treatment effected a speedy and perfect cure.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 25, 1929.

There exists, in some parts of the country, a hedges and walks are described as blended to species of fly, which naturalists call astrus ovis, of gether in scenes on which the eye rests with the same genus with that which deposits eggs in pleasure. The ostentation of the farmer of New the hair of horses, and causes botts. This fly at-England usually contents itself with rearing a tacks sheep, from about the middle of August to huge exterior, whose construction exhausts his re- the middle of September, deposits its eggs in the sources, and leaves neither disposition or resources, nostrils of the animals, and causes those worms, to complete the interior, so that the husbandman which so frequently destroys them. The Mechaoften lives in a great shell, of which one portion | nic's Gazette recommends as a preventive, "covonly is rendered habitable. The ornaments which leving the nostrils of sheep with a list of gauzy subwith a little attention and care might form pillars stance, through which the animal can breathe, the chissel of the sculptor has ever worked on stance." We doubt, however, the practicability temple or palace, are neglected, and the slovenly of "keeping it in its place." Another preventive garden seems to call out shame on the listlessness which sheep owners tell us is effectual, is to keep the noses of the slice; constantly smirched with ter, from about the middle of August to the latter end of September. If the sheep swallow some of

> If the fly has performed its mischievous funcyou may make use of the following: Take half a pound of good Secteh snuff, pour two quarts of cover. I never knew any bad effects to follow. Dry shuff may be blown up the nese with a quill. and have a good effect; but it is a tedious dirty job. I have tried vinegar and blue die with but little or no success.

Instead of Scotch snuff, a decoction of tobacco will answer the purpose. A gentleman who owns a large flock of sheep, informs us that he had used it with perfect success. Spirits of turpentine are injected into the nostrils of sheep, as a remedy for worms; but that substance appears to possess one material disadvantage, which should preclude its

use for that purpose, usuely, when thrown into the nostrils it kills the sheep as well as the worms.

From an inadvertance in our paper of the 11th instant, the notice of the annual meeting of the Massachusetts Society for Promoting Agriculture was incomplete. After the vote of thanks to the Hon. Mr. Lowell, the following vote was passed, Mr. Prince having also declined a re-election:

Voted, That the Society learn with great regret the determination of John Prince, Esq. to decline a re-election as a member of the Board of Trustees; and that the thanks of the Society be pre- with the prognostications connected with St. sented to him for the weil known assiduity, zeal, and interest manifested by him in the cause of agriculture, while a member of the Board.

A true copy from the record.

BENJ. GUILD, Assist. Rec. Sec'y.

Corrected list of the officers. Hon. Thomas L. Winthrop. President, Hon. Israel Thorndike, First Vice President, Hon. Thomas H. Perkins, 2d do. Hon. John Lowell, Corresponding Secretary, John Heard, Jr. Esq. Treasurer, Gorham Parsons, Esq. Recording Secretary, Benjamin Guild, Esq. Assistant Recording Secretary

Hon. Richard Sullivan, Hon. John Welles, Hon. P. C. Brooks, Trustees. Wm. Prescott, Esq. E. H. Derby, Esq. John C. Gray, Esq.

We beg leave to call the attention of our readers to the advertisement of Mr Champion, in our paper of this day. The American improver has now a rare opportunity to become possessed, at reasonable prices, of very time stock.

In addition to the great variety of fruits with which the Philadelphia market is supplied, Peaches have been exposed for sale of tolerable quality and in considerable quantities. Young corn is abundant. By arrivals at New York from Charleston and Norfolk, we remark several cargoes of Watermelons.

Thames Tunnel .- We are glad to find, that the Company for prosecuting this great and arduous enterprise, have passed resolutions for its prompt gave him his own way. So soon as their intencompletion. The water has again been entirely tion was abandoned, he became appeased, though excluded from the shaft, and nearly 300 feet of not altogether so, and hence still reminds the dethe south Tunnel is dry. The public are again admitted to inspect the great work .- The sum expended on it is 130,000%, and it is calculated that day is termed St. Martin of Bullion's Day, and the only 170,000l, more will be necessary to complete it.

Wool .- The Boston Courier states that more than \$200,000 have been paid in this city, since the passage of the Tariff, for wool raised in Massachusetts, Rhode Island, Connecticut, Vermont, and New York.

The Clove is now cultivated in the vicinity of Port au Prince, in the island of St Domingo. A single tree has produced sixty pounds, of excelin the south western part of the United States?

Blackstone Canal .-- This canal is new navigable from Providence to the Albion Factory. With will probably be opened to Worcester.

The Mowing Match at Capandaigua, on the 4th excited much interest. The first premium, a Plough, was awarded to Samuel Remington, of profiting by the sale of fruit trees which should be that town, who mowed, in one minute, 100 feet corrected. It is extremely vexations for a man to in length, and a total of 892 square feet.

The tax on foreign butter and cheese, imported into England during the last year, amounted to 300,000 pounds sterling.

ST. SWITHIN'S DAY.

Most of our readers, perhaps are acquainted Swithin's Day, which has just passed, being the 15th of July. The old Scotch proverb respecting it is :-

"St. Swithin's Day, gif ye do rain, For forty days it will remain. St. Swithin's Day, an ye be fair, For forty days 'twill rain na mair

The unusual quantity of rain since Tuesday last, St. Swithin's Day, has gone far towards converting us to the belief in this popular superstition, ciety, is incalculably greater than the benefit te and had it not been for the late delightful change, the other. in the weather, we should have advised our farming friends to prepare for a forty days' rain, and in the meantime have cudgelled our brains for the invention of some method of making hav within doors, on the economical and labor saving principle of the Paddy, who said, "if you want your potatoes dug, fetch 'em along." While on the subject we will refer to the circumstances from which the tradition abovementioned is said to have taken its rise, which cannot fail to interest and amuse the reader. In doing this we shall again draw upon the excellent article on Popular Superstitions, in the last American Quarterly Review. Swithin, or Swithum, Bishop of Winchester, who died 868, desired that he might be buried in the open church yard contrary to the usual custom with Bishops, and his request was complied with; but the monks, on being canonized, considering it disgraceful for the Saint to lie in a publick cemetery, resolved to remove his body into the choir, which was to be done with solemn procession on the 15th of July : it rained, however, so violently for forty days together, that the design was abandoned. The vulgar tradition adds that the monks, finding it vain to contend with a Saint who had scendants of those obstinate people of the supremacy of his power. In the north of Scotland this same superstition is there prevalent. One thing is certain, our summers are every year more and more assimilated to the British summers, in a majority of which there is a showery period at this season .- Lancaster Gazette.

Worth knowing .- The toad is said to be a voracious destroyer of that worst of all domestic ver- have completed their examination and survey of min, cockroaches. It is stated that two or three the rail road, to the borders of the State of New toads, being placed in the kitchen one night, upon York, through part of Pittsfield, Lanesborough examination in the morning, were found complete. TO HORTICULTURISTS.

-There is a negligence amongst some who are purchase a fruit tree, have it taken a thousand miles, nurse it a dozen years, and instead of realizing his expectations, to find fruit of a most inferior quality. This has happened with a gentleman in Frankfort, Ken. in relation to the seckle pear; and he has circulated around him the grafts. so that the injury is extensive. I hope you will put in your paper a short paragraph, that you will, upon request of any gentleman who may hereafter be imposed on, give publicity of the kind of deception, and by whom practised, provided the deception was made by a vender of trees.* This will correct a carelessness which must be its cause ;--for I cannot believe there is any man so lost to what is due to himself and to his fellow man as to thus deceive him for the paltry sum of the price of a small tree; the injury to the one, and to so-

" [We shall have no hesitation in doing it if the person making the complaint will leave his name with the editor .- American Farmer.

From the Snuthern Agriculturist.

THE PROCESS FOR MAKING CASTOR OIL.

Dear Sir. In compliance with your request, I send you the process for making Castor Oil; and hope that it may prove useful to the gentleman who requested the information.

After collecting the bunches of seeds, expose them to the sun until perfectly dry-then lay them on a scaffold, and beat them with a very small flail, which will separate the hull from the seed; then pound them in a wooden mortar till the shell of every secd is broken. Have a vessel of water at boiling heat, which you will then put the seed into from ten to twenty minutes. A dirty scum will rise which must be taken off; the clear oil will then rise, which must be put into a second vessel without water, to be acted on by a slow fire, not to arrive at boiling heat; as soon as it appears clear and transparent, taking off the scum the elements so completely under his control, that may appear, (which will make an inferior quality of oil;) it is ready for bottling; as soon as cold, exclude it from the air. The kind of Palma Christi said to be the best for making oil, is

P. S. The quantity of water in the first vessel must be as three to one to the quantity of the best seed, and stir frequently to prevent its adhering to the bottom of the vessel, which would give it a burned taste. Be careful that it does not boil over, as it will take fire.

I remain yours, &c.

Rail Road .- Messrs. Makepeace and Baldwin twenty-five feet in a mile. The New York commissioners set out on Monday to examine the The best feelings are entertained towards this that State .- Bos. Daily Adv.

Apothecaries .- This business increases rapidly, and we fear that it is too often left to inexperienced hoys. An elderly lady, finding herfelf triflingly indisposed, sent for some peppermint, and took a few drops; it produced a stupor, and on examination of the phial, it contained hemlock. A few drops more would have put her to sleep "to wake no more." The greatest caution is necessary in venders and purchasers of drugs .- Enquirer.

When to praise .- Praise the fineness of the day when it is ended - praise a women when you have known her-a sword, when you have proved it a maiden, after she is married -- the ice, when you have crossed it, and liquor after it is drank.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturalists in the vicinity of Boston and New York, will be published by J. B. Russell, Proprietor of the New England Farmer on Monday. The articles are arranged alphabetically, and comprise the most useful Vegltables and FRUITS which can be conveniently and economically cultivated in the climate of New England and the Middle States; as well as a Treatise on FLOWERS, and on LANDSCAPE or PICTURESQUE GARDENS, on the general management of the SILK WORM, and the manufacture of SILK, and a Treatise on the culture of GRAPE VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples, Pears, Peaches, Cherries Plums, Nectarines, Apricots, &c. &c. that can be raised to the most advantage, and their relative for wardness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written,

The following is the General Index of the book, which is superadded to a Calendarial Index, giving directions for performing the work of all the months in the year as they follow in succession.

Genesce-Indian Reservation Lands.

On the 3d of September uext, at Batavia, and on the 10th of September, at Batavia, will be sold at auction about forty thouand acres of land in the Tonnewanta, Canneadca, Enflato and Cattaraugus reservations.

The tiffe is indisputable, and information respecting it may be had, and maps showing the lots to be sold may be seen, on application to Thomas & Ogden, in New York-J. Fellows, at Geneva-G. W. Long, at Batavia, and H. B. Potter, at Buffalo.

Valuable English Stock.

Mr Champion of Blythm Nottinghamsh re, who has sent several mens of his Improved Short Horns, and high bred Leicester Sheep, into the United States, and who has for the last twen-ty years had the honor to obtain a great number of premiums and sweepstakes for both his cattle and sheep, at various agricultural associations, now intends to give up his farm, and to sell by anction without reserve, the whole of his breeding stock, sell by anction without reserve, the whole of his breeding stock, consisting of nearly one hundred fread, Including Balls, Cows, and Heifers, and the celebrated Miss. Poynts, with a very superior bult eaff bred from her, by Blyth Favorne. Also about 150 Rams, and 700 breeding Ewes. The sale will take place on the 4th and 6th of September next. Mr C, has sparred neither trouble in selecting, nor expense in obtaining the best animals; and his sheep combine with constitution, the most valuable conclusion of size great inclination to future with a superior ble qualities of size, great inclination to fatten, with a superior staple of wool, both for length and fineness. Mr Champion will be glad to afford every accommodation to purchasers, in sending the stock to Liverpool, from which place he is distint on 95 miles.

Blyth, near Bawtey, (Eng.) May 12, 1328.

Patent Balance and Hay Scale Manufactory.

The subscriber, agent for Thomas' Improved Patent Hey Scales, and patent Balances, nforms the jublic that he has on hand a good assortment of correct and well finished patent Enl-ances of all sizes—and will formsh at the shortest notice has improved Hay Scales of any size or weight-apparatus of every description furnished separate for old or new works

J. R. NEWELI

Budding or Inoculating

May be performed from 15th July, to the 15th September (there are many kinds of fruit that cannot be raised otherwise) such as peaches, apricots, nectarines; and it is the readest was of obtaining the chaicest kinds of roses on sweet briar or common rose stocks. Budding of roses is the most beneficial, an the best way to increase that valuable flower. You can obtai 12 from one cutting. A man bred to the nurser, business an who has the best method known for budding, will make public the art for a small compensation; and 9 out of 10 grows. This man will attend any who has 2 or 3 days' work, at moderate wages, and may be heard of at the New England Farmer Sec july 25

Patent Green House.

The subscriber proposes to solicit a patent for a green house The subscriber proposes to solicit a patent for a green house which will be built without stone, brick, lime or sand; also with out burning any kind of fuel, or using steam or dung, and only laif the usual quantity of glass. The sumpleity of its construction, the cheapness of building, and the saving of expense, make this invention worthy of notice. Any mun of taste can have one for a triling sum. The subscriber would prefer a subscription from those interested, before taking a patent.

Roxbury, July 28. GEORGE HEWSON.

A Partner Wanted,

Who can command a capital which he would be willing invest in establishing a Horticultural and Botanical Garden Bahimore. He may now have an opportunity of forming a con-Bathmore. He may now neve an opportunity to rearing a con-oction with a person capable of conducting such an establish ment, and who possesses many advantages. For further mor-mation, majure personally, or by letter, post part, to G. F. Mil-ler, Baltimore, Jone 18, 1623.

For sale, an Improved Short Herned Durham Cow, and Bu Calf, three weeks old, from the Coclebs stock, of remarkable good size and form; color red and white, handsomely mixed The last year's Calf (a heifer) from the same Cow channel premium at the Brighton Caule Show no October last. Inquire at the office of the New England Farmer.

Bull Calf for Sale.

For sale, a beautiful Bull Calf by Admiral, a very desirable animal for those who feel interested in the improvement of our bull of the sale. breed of Stock.—Apply to Maj. Jaques of Charlestown, where he may be seen. 3t July 18

MISCELLANIES.

TO A CHILD.

Thy memory as a spell Of love, comes o er my mind-As dew upon the purple bell-As perfume on the wind-As music on the sea-As supshine on the river-So hath it always been to me. So shall it be forever.

I bear thy voice in dreams Upon me softly call, Like echo on the mountain streams, In sportive water-fall. I see thy form as when Thou wert a living thing. And blossomed in the eves of men, Like any flower of spring.

Thy soul to heaven bath fled, From earthly thraldom free; Yet 'tis not as the dead That thou appear'st to me. In slumber, I behold Thy form as when on earth-Thy locks of waving gold-Thy sapphire eye of mirth.

I hear in solitude. The prattle, kind and free, Thou atteredst in joyful mood, While seated on my kucc. So strong each vision seems, My spirit that doth fill, I think no they are dreams, But that thou livest still.

these sad words: "Had I been as diligent to serve my God, as I have been to please my king, he would not have forsaken me in my gray hairs."

Dread of death-It is a common symptom in nervous disease, and is here considered with its regard to its influence on health. In these cases feels that he is mortal; but after forty a man's thoughts are much occupied by the inevitable prosright views, who have had a liberal allowance of a beet? a cabbage to a cabbage? sickness and sorrow, death becomes an object not so much of apprehension as of curiosity and interest. This state of mind is not only necessary for our comfort during health, but for our safety during sickness. One of the ablest physicians alive, once said that in a dangerous illness, cateris paribus, a christian would have a better chance of recovery than an unbeliever-that religious resignation was a better soothing medicine than a poppy,

gives a similar opinion in the following expressive passage: "The habitual horror which thus over- expected. - Salem Gazette. shadows the mind, darkens the little daylight of life. An indulgence in this morbid excess of apprehension not only embitters a man's existence, but may often tend to shorten its duration. He hastens the advance of death, by the fear with which his frame is seized at its real or imaginary approach. His trembling hand involuntary shakes alive, but hearty, and apparently in a thriving conthe glass in which his hours are numbered."

Contradictory as it may appear, there are well attested instances of persons who have been driven even to suicide by the dread of dissolution. It would seem as if they had run into the arms of death in order to shelter themselves from the terror of his countenance .- Quar. Rev.

Method, as Mrs. More says, is the very hinge of business; and there is no method without punctuality. Punctuality is important, because it subserves the peace and good temper of a family; the want of it not only infringes on necessary duty, but sometimes excludes this duty. Punctuality is important as it gains time; it is like packing things in a box, a good packer will get in half as much more as a bad one. The calmness of mind which it produces, is another advantage of punctuality: a disorderly man is always in a hurry : he has no time to speak with you, because he is going elsewhere : and when he gets there, he is too late for his business, or he must hurry away to another before he can finish it .- It was a wise maxim of the Duke of Newcastle-"I do one thing at a time." Punctuality gives weight to character .-"Such a man has made an appointment: then I the time; and in New York, unless drunk all the Cardinal Wolsey, one of the greatest ministers know he will keep it." And this generates pune- time. of state that ever was, poured forth his soul in tuality in yon: for like other virtues it propagates itself: servants and children must be punctual

Agriculture.-I one year raised a large supply it seems rather to spoil life than destroy it. Not of earrot seed, so that I had much left after sowonly the child, but the young man till thirty never ing the next year, and continued to sow from the same parcel for seven years at least; but was surprised to find, as I thought, my ground much impect, and most of us have our little corps of con- poverished, though yearly manured; for, at the solution to protect us from the fear of it. Those last, though my seeds vegetated, which I thought of authors come out in their works. One of the a sufficient proof of their goodness, yet at last most remarkable, is a little Essay on Death, by they did not grow well for two or three years, till Lord Bacon; not that in his Essays, but towards they were little larger than pipe-stems, and were the end of his works, near his will. The curate not worth pulling. But as my seeds vegetated, I of a London parish, who has great experience of was wholly unconscious of the cause; however, 1 death-bed scenes, was asked how people general-finally threw away my seeds and got new ones; ly met their end? And the answer was, "either and the next planting in the same ground succeedthey wish for it as a relief from suffering, or they ed well; my seeds vegetated quicker, grew thrifare not conscious of it." Even Dr. Johnson, who ty, and produced abundance; and I am within dreaded death so much at a distance, seems to bounds in saying of ten times the size of those have feared it as little on his arrival as other peo- produced from the old seed. Now, what is the ple; and we believe that to many persons with value of a carrot seed to a carrot? a beet seed to

> Temperance .- It is worthy of record, that no ardent spirits were used by the seamen, at their dinner on the Neck, on Friday the 4th inst. This is really one of the most encouraging signs of the times-that a class of people, whose profession has always been held to give them a peculiar license in all the points of minor morals, and whose hardships have often no other alleviation than is furnished by a recourse to the can of grog, should of subscribing, are entitled to a deduction of fully coats.

and a better cordial than an æther. Dr. Reid set an example of this kind, was more than the most sanguine friend of temperance could have

> The toad .- An English farmer on the 20th May, 1826, inclosed a small toad in a garden pot, rendered air tight, and buried it in the ground; and on the 14th May, 1828, in presence of a witness, he dug up the pot, and found the toad not only dition, as it had grown considerably; the lustre of its brilliant eyes appearing to be not a whit diminished by its long incarceration.

> Dr. Maeartney, the anatomical professor in Dublin, with about fifty other surgeons, have begun the patriotic work of surrendering up their own bodies for dissection, by signing, with all dne solemnity, an order to their respective executors to that effect .- Albion.

In a Charleston paper now on our table, is an advertisment of a raffle-and the article to be gambled for is a folio Family Bible !- The advertisement is headed, "faint heart never won a fair lady."-Providence Patriot.

THE ARTS.

FOR THE NEW ENGLAND FARMER.

KELP, OR CRUDE SODA.

MR FESSENDEN, -Considering the vast increase of the manufacturing establishments in our country it may be thought extraordinary that the manufacture of kelp or crude soda has not received the attention of our industrious and enterprizing citizens; those especially, who are particularly interested in the bleaching, soap, and glass establishments. The plants from which kelp may be obtained are to be found in inexhaustible abundance on our shores without the trouble of culture; especially at Cape Ann and Marblehead, and are frequently employed as a manure. The manufacture is so simple as to require no scientific knowledge; a few days' experience on a small scale would enable any person to prosecute the business extensively, and no doubt to great pecuniary advantage. In conversing with a gentleman interested and experienced in the great bleaching establishment at Dover, N. H. he manifested a disposition to introduce and encourage the use of American kelp if he could be furnished with a sample for experimental trial, and it should be found to answer the desired purpose. The American article may, it is presumed, be afforded at a lower price than the imported.

Fuci is the betavical or generic term for the various species of marine plants commonly known ors and dealers respecting its nature, and the by the names of sea-weed, sea-wreck, and staware. They are found on flats at low water, or attached to rocks near the shore and in coves. It has been ascertained that Fuci grows with astonishing rapidity from floating seeds lodged on rocks and stones.

Fuci vesiculosus. In this species, the frond is a leaf-like substance resembling leather or parchment, midribbed, the stem forked or parting in pairs one after another. The vesicles or air bladders are globular and innate in the membrane of the frond. It is readily distinguished from Fuci nodosus by the air bladders very generally occurring in parallel pairs, while in nodosus they are single; and from F. serratus by the edges of the frond being entire or wanting the serratures which mark that species. It is generally from one to three feet in length. One pound of the ashes position of sea salt by chemical processes. gives three ounces of kelp. This species is most highly prized for the manufacture of kelp.

Fuci nodosus. The frond is leathery, compressed, veinless, branched, and feathery, the receptacles are divided and have a small stem, roundish, mostly solitary. Fronds from two to six feet in length and at short distances swell into large air blubbers.

Fuci serratus. Frond, leathery, flat, midribbed, divided; serrated at the margins. Receptacles solitary, flat at the ends of the stem, serrated, sharpish. It grows in deep water, and is only uncovered at the ebb of the tide. This is inferior for kelp.

Fuci lorcus. This is the small kind, growing abundantly on rocks, and is called rock-weed .-This yields well in excellent kelp. It consists of

also yields good kelp.

The public are indebted to Dr. John Revere, now of New York, for the following valuable communication, relative to the crude sodas of commerce. It has been published in Professor Silliman's excellent journal, for December last, and merits a republication in the New England Farmer, for the benefit of our citizens who reside on our sea coast.

Plymouth, July 17, 1828.

Some Remarks on the Crude Sodas of Commerce ; by John Revere, M. D. Lecturer on Chemistry, applied to the Arts, at the Maryland Institute for the Promotion of the Arts and Manufactures.

New York, October 15, 1827.

Sin-In a course of lectures on chemistry, applied to the arts, I had occasion to collect the facts contained in the following paper. To those who are familiar with the science of chemistry, there will be little that is new. I have been induced to offer these remarks to your Journal, rather from its title, than the general scope of its contents, which I observe are almost purely scientific .-The importance of this substance in the useful arts, the ignorance observed among manufacturshametal impositions sometimes practised, constitute its chief claim to your attention. The facts stated may be relied upon, as they have been established by repeated experiments.

JOHN REVERE, M. D.

Crude soda, in whatever manner procured, is generally known in this country, among manufacturers and merchants, by the name of barilla .--But as the value of the article depends very much upon the former circumstance, it will be proper to observe, that it is obtained as an article of merchandize, chiefly in four different modes, viz. 1. in a saline form, on the surface of the earth, and from the water of certain lakes; 2, from the incineration of certain land plants; 3, from the combustion of marine plants; and 4, from the decom-

The crude soda, formerly known by the name of natron, is found in considerable quantities in Egypt, the interior of Africa, and in South America. It exists in lakes, and in particular districts, and forms an efflorescence upon the surface of the earth during the dry season. I am not aware merce, in the United States.

The most valuable of the crude sodas known in this country, are obtained by the incincration of several kinds of plants which grow in the vicinity of the sea. The best is brought from Alicant, Malaga, and Carthagena, in Spain; it is obtained from an annual plant, the salsola sativa, which is cultivated and secured like hay, and afterwards burnt in holes dug in the earth. From the great quantity of soda it contains, it melts into thick This yields well in executing keep. It consists of paste, which on cooling, becomes condensed into a simple frond without branches, and is sometimes a stonelike mass; the popular name of this plant

called catgut. It affords considerable quantities in Spain, is barilla. So highly is this plact esteemed in Spain, that, according to Mr Parkes, Fuci palmatus, is the kind known by the name the exportation of the seed is prohibited, under of dulse. It is divided deeply and spreading so as penalty of death. There are several varieties of to resemble the hand with the fingers spread. This the salsola cultivated on the shores of the Mediterranean, especially in the island of Sicily, and also in the Canary Isles, which yield an abundance of soda. For convenience, all the crude sodas obtained by the combustion of land plants. may be called barilla. The barilla most common in our market is brought from Spain, Sicily, Teneriffe. Although many parts of the United States are favorably situated, I have known but one attempt to cultivate them. It was made on the eastern shore of Maryland, from seed procured for the purpose in Sicily. The attempt failed, owing evidently to the imperfection of the seed.

The increased demand for soda for the arts. throughout the civilized world, has led men to seek other sources from which this useful substance may be procured. Modern science and industry have succeeded in extracting a large supply from marine plants, which were accounted so entirely worthless among the ancients, that algoprojecta vilior was a common proverb at Rome. The substance produced by the combustion of these plants is called by the French rarech, and by the English kelp. The inhabitants of the coast of Europe have been in the habit, from time immemorial, of collecting the sea weed, wrack or sea ware, as it is indiscriminately called in Great Britain, and manufacturing it into a coarse alkali, for domestic purposes. It is only, however, within a century that any attempt has been made in Great Britain to prepare the kelp in a large way. It was in the year 1723 that this substance was first brought into the market as an article of merchandize. But the great consumption of the alkalies in the modern arts, especially by the bleach er, soap and glass manufacturer, and other manufacturing chemists, has attracted more and more attention to the subject, until the manufacture of kelp in Great Britain has become a very important department of industry. I am under the impressien that kelp has never been brought into our market, or attempted to be manufactured in the United States, but as it appears to me that this manufacture may be introduced advantageously among us, I propose to give some account of the most approved method at present practised, in the hope that it may direct the attention of those persons to the subject, who are conveniently situated for making the attempt. From the increase of our manufactures, and as all the crude sodas at present consumed are imported, it is highly probthat in this form, it is known as an article of comlecting it, be had in immense quantities, along our extensive sea coast, nor can anything be cheaner or more simple than its manufacture. Some idea may be formed of the advantages that may be derived from this manufacture, from the great and obviously increasing importance that is attached to the subject in Great Britain. There are frequent communications on the subject in their best journals, and prizes offered to encourage its cultivation, by their societies for the promotion of the arts and manufactures. As long ago as 1798, it

considered valueless.

Nearly all marine plants, especially the fuci, are found to yield soda from combustion. Those which are preferred are the fucus resiculosus, nodosus, and serratus; they are found spontaneously growing on the rocks near the shore, generally between high and low water marks. Generally speaking, bays and coves that are sheltered from the winds and tides are found best, though some of the fuci flourish best in the most exposed situations, and the strongest tide-ways. Formerly, the keln was made entirely from the floating sea-ware as it washed up on the shore; but, since the mannfacture has become profitable, greater care is taken in its preparation. It is now common to cultivate these plants by depositing on sandy beaches large boulder stones, to which the fuci may readily attach themselves, and to cut and collect the ware; calcareous stones are found best. In the Repertory of Arts, there is a particular description of the process employed in the manufacture of one hundred and fifty tons, on the farm of Stroud, in Horris, which received the prize of the Highland

This sold for five pounds ten shillings per ton. As this is considered the most approved method, I will give an abstract of it. In the Orkneys, they account the spring the best season for cutting the ware, because they are less exposed to the rains. The weeds that are left bare by the tide are cut with sickles, and those under water with bill hooks. It is considered important to land the ware, as fast as it is cut, and to carry it to a suitable situation to dry; it is thought that as soon as the weed begins to wilt, the pores of the plant become relaxed, and allow the soda to exude, which is dissolved and lost, if the ware be left in the water or exposed to the rains. There is no doubt that kelp made from such ware is weaker. 'It is spread on clean ground to dry, and when pretty well dried, it is collected into large cocks, protected from the rain if possible, and allowed to heat for six or eight days, or even from fifteen to twenty if the ware has been collected from coves with muddy bottoms. A day day, when there is a brisk breeze, is selected for burning the ware, which is conducted in the following manner. The kilns are rudely constructed of stones and turf upon the firmest sward that can be found. The most convenient fect in length, according to the quantity of ware breeze. Should the weather become calm, or if more disproportionate. the ware is not sufficiently dry, the ashes cool and cake into white crusts, when it becomes necessary to rake the ashes until the combustion is perfect, before adding fresh ware. When the ware is all burnt, the last process consists in working or raking the ashes with iron rakes, so that the combustion of every part shall be perfect. It is transformed into a thick paste, which, on cooling, beomes solid, somewhat resembling good indigo; it ing nature. As to the effects they may have on surer, and secretaries, will perform the duties usu-

FOR THE NEW ENGLAND FARMER.

Copy of a letter from Dr Mitchill to Wm Prince, Esq. Proprietor of the Linnæan Botanic Garden.

New York, 19 June 1828.

WM PRINCE, Esq. -- I offer you thanks, my dear sir, for the copy I very lately received of your Short Treatise on Horticulture, &c. It came in very seasonably after the perusal of Mr Wilson's publication, and of Major Adlum's tract on the Vine, to which I may add Dr Mease's book on Silk, compiled at the request of the Secretary of the Treasury.

I have gone through it once with pleasure and instruction, and I intend to do it again. You have united so much science with practice, or in other words, associated so much Botany with Gardening, that I shall keep it near me as a work for steady reference.

I consider your descriptions of Fruit trees and fruits, of Ornamental trees and Shrubs, Grape and Strawberries, Bulbous roots, Green house plants, and others, highly interesting. I am interrupted by visitors, and have only time to offer one of my late feeble efforts in return,

> So farewell. S. L. MITCHILL.

FOR THE NEW ENGLAND FARMER.

SILK WORMS.

MR. FESSENDEN,-The attention of the public has been so much engaged lately in the history and rearing of the SILK WORM, that every thing connected with the subject must be interesting. Under this impression, I would state the following facts, to show that these entirely inoffensive and defenceless insects are expesed to suffering from the attacks of an insidious enciny from which they should be protected.

On visiting my little family of worms, I several times remarked that a spider had let himself down upon the place where they were feeding, and had evidently been an annoyance; and have since had reason to believe that some perished from wounds which they had received. Yesterday, on visiting are about two feet six inches in height, two feet the matted moths, I perceived a large male moth four inches in breadth, and from eight to eighteen suspended about a foot above the shell, by the scarcely visible filament of a spider's web, attached to to be consumed. A little dry straw is first spread the ceiling, two feot and a half above; and found over the bottom of the kiln, and kindled, to which that this had been effected by a little bottle spider the ware is slowly added, as fast as it is con- (so called) whose bulk was not equal to a twelfth sunced, the combustion being accelerated by the part of the moth's, and whose weight must be still

FOR THE NEW ENGLAND FARMER.

POTATOS FOR CATTLE.

MR FESSENDEN-I observed in a late New England Farmer an article from the Massachusetts Agricultural Repository, headed "raw potatos bad September annually. for milch cows," stating that they were of a grip-

ers, that although potatos increase the quantity of milk, they render it more thin and less nourishing. found them a very nourishing food for neat stock. For many years past I have fatted my beef solely on raw potatos, and have witnessed none of the accidents alluded to, nor observed any of the griping effects mentioned. Cattle will almost invariably devour them greedily, even at first, and if they are then given too plentifully, a relaxation is produced, which feeding with hay will soon correct. Several years ago I fed one cow separately on ruta baga or Swedish turnip. She did well, but did not thrive so fast as those fed on potatos. And I would here remark, that the ruta baga gave no bad taste to the beef, as some bave feared it would. I have found that while I resided in a town not so near Boston market, and where potatos were raised in greater abundance, that they were on the whole, the cheapest and best food for fattening cattle I could raise. A FARMER.

Lynn, July 28, 1828.

Remarks by the Editor-The observations of our correspondent, as given above, are in perfect accordance with those of Mr Lowell in his remarks on the article alluded to by our correspondent ;and republished in the Massachusetts Agricultural Repository for the express purpose of proving its statements to be incorrect.

FOR THE NEW ENGLAND FARMER.

AMERICAN LYCEUM.

We have been requested to give an insertion to the following prospectus, and are well wishers to the plans for improvement which it contemplates.

The undersigned agree to associate under the name of the ---- branch of the AMERICAN LYcens, and adopt the following articles for their constitution.

Article 1. The objects of the Lyceum are the improvement of its members in useful knowledge. and the advancement of popular education, by introducing uniformity and improvements in common schools, by becoming auxiliary to the Board of education.

Article 2. To effect these objects, they will procure a cabinet, consisting of books, apparatus for illustrating the sciences, and a collection of minerals, will hold meetings for discussions, dissertations, illustrating the sciences, or other exercises which shall be thought expedient.

Article 3. Any person may be a member of the Lyceum, by paying into the treasury annually, two dollars; and twenty dollars paid at any one time, will entitle a person, his or her heirs or assigns, to one membership forever. Persons under eighteen years of age will be entitled to all the privileges of the Society, except of voting, for one half the annual sum above named.

Article 4. The officers of this branch of the Lyceum shall be a president, vice-president, treasurer, recording and corresponding secretaries, three or five curators, and three delegates, to be appointed by ballot on the first Wednesday of

Article 5. The president, vice-president, trea-

ally implied in those offices. The curators will machine for tides, another to show why there is a and will be the general agents to do any business; are flattened at the poles. for the Society under their direction. The delegates from other branches of the Lyceum in this for fifty dollars. county semi-annually, to adopt regulations for their general and mutual benefit, or to take measures to introduce uniformity and improvements into common schools, and to diffuse useful and practical knowledge generally through the cominunity, particularly to form and aid a board of education.

Arlicle 6. To raise the standard of common education, and to benefit the juvenile members of the Lyceum, a portion of the books procured shall be fitted to young minds; and teachers of schools may be permitted to use for the benefit of their pupils who are members of the Lyceum, the apparatus and minerals under such restrictions as the association shall prescribe.

Article 7. The president or any five members will have power at any time to call a special meeting, which meeting shall be legal if notice shall be given according to the direction in the by-laws.

Article 8. The Lyceum will have power to adopt such regulations and by-laws as shall be necessary for the management and use of the cabinet, for holding meetings, or otherwise for their interest.

Article 9. The foregoing articles may be altered or amended by vote of two thirds present, at any legal meeting; said alteration or amendment having been proposed at a meeting, not less than four weeks previous to the one at which it is acted upon.

APPARATUS FOR SCHOOLS, ACADEMIES, AND - LYCEUMS.

The articles in the above list can be procured

COLLECTIONS OF MINERALS.

Specimens in geology and mineralogy, intended to represent one hundred of the most useful productions in the mineral kingdom, are collected in quantities sufficient to supply such schools, lyceums, and individuals, as shall wish to procure them, and consist of the following minerals, viz.

Quartz, three varieties-mica, two-felspar two-granite, six-gneiss, two-mica slate, three -lime, four - marble, twelve - hornblende, twohornblende rocks, five--argillite, two--talcose rocks (soapstone), three-sandstones, three-gray wacke, three-chlorite, one-chlorite slate, twogypsum, four-porphyry, three-amygdaloid, one -asbestus, two-serpentine, two-jasper, oneclay, three -- soils, five -- coal, ten -- iron, ten -- lead, one-copper, one-graphite, one-rock salt, one.

Each specimen will be labelled and numbered with a description of its ingredients, proprieties, uses, and localitics, in a small volume to accompany each set.

The collection above named, with the volume, can be procured for twenty dollars.

Letters upon the subject of apparatus or minerals directed to Josian Holbrook, Boston, will be duly attended to.

From the Montgomery Freeman.

RHEUM PALMATUM, OR PIE-PLANT. Improvement in rural economy is of a tardy

growth, compared to the progress of the mechanic arts. In the latter, some fortunate genius invents covered any thing materially useful, it is soon exwhatever improvements he may make, ever thinks of asking a patent. His discoveries are noticed vield their treasure so soon after planting, and re-

The pie-plant is another instance of the slow-For natural philosophy, are a set of mechanical ness and difficulty with which every new vegetable finds its way to notice. There is every where a partiality to articles of customary culture, and it years coming to any degree of maturity; which For chemistry, are a pneumatic cistern, an iron discourages many persons from attempting its cultivation, and for a long period deprives the cook of an opportunity of gaining, or exerting her skill. In addition to all this, the true name of the plant, (rhubarb) has, in some instances prevented its culians; several articles for illustrating eclipses, a a new one (pie-plant) in order to prevent a pre-

vious nausea and disgust. But in opposition to all these circumstances, within sixty years past it has spread from its native Tartarian mountains or the hills of Thihet, to every part of the globe where horticulture is understood; and now bids fair to be as extensively used as any other production of the garden. In England it is in high estimation. Mr. Cohbett says that not less than thirty wagon loads of this article is sold every day in the London markets.

These remarks are made to awaken the attention of the Montgomery farmers to the cultivation of this valuable esculent. It is the best propagated from the seed, which is now just ripe, and should be planted immediately; for if not sowed until spring, it very often fails to germinate, and a season is lost-whereas, let it be directly committed to the earth, and in a few days it will be up. If the weather should then be hot and dry, let the young plants be shaded from the violence of the sun. They will require no further attention until the next spring, when they should be taken carefully up with as much dirt about the roots as possible, and transplanted where they can always remain. If the soil be deep and good, they will improve for twenty years, annually producing an abundant crop. A dozen plants are sufficient for a family. Those who would wish more particular directions, may consult Fessenden's "New American Gardener," just published at Boston.

AGRICOLA.

Tea plant .- This plant has within the last few years been cultivated in Brazil, on a very large scale, and with great success. It was originally brought from China, about the year 1816, by orders from king John 6th, and during the administration of Count la Barea; when a number of Chinese, accustomed to its cultivation and preparation, were, at the same time, conveyed to Rio de-Janeiro, for the purpose of naturalizing it. It was first planted at the royal estate of Santa Cruz, formerly belonging to the Jesuits and now converted into a perfect paradise; and eventually it was spread to several of the Provinces. In that of St. Paul, where the soil and climate have been found peculiarly congenial; the plantations are on an extensive scale, and the Brazilians are said already to grow sufficient for their own consumption. In five years, it is expected, they will be able to export a considerable quantity, which certainly will be considered a phenomenon. A Brazilian young gentleman, who has for some years been pursuing his literary and useful researches amongst us, has furnished several scientific persons in London with samples of Brazilian tea; and, on infusion, it is found stronger than that of China, usually drank, which may, perhaps, be owing to its being of last year's growth, whilst the tea consumed in England is generally three or four years old. Should this new article be imported here, it is a quere under what denomination it can be placed, unless the custom-house allows it to rank with medicinal herbs .- London paper.

To remove an attack of the sick headache, a correspondent in one of the monthly journals recommends the patient to take a table spoonful of ginger, mixed with a lump of sugar, in a tumbler three parts full of water, with the chill off; to sit, for a quarter of an hour, with his feet in water agreeably warm; and to apply a napkin, wrung out of cold water, to his temples or forehead, whichever part appears most affected.

BEET SUGAR.

It may be within the recollection of some of our readers, that when attempts were first made to extract sugar from the beet, the project was treated with great ridicule. The first experiments on a large scale were made under the patronage of Napoleon, when at the height of his power he attempted to enforce his famous continental system, against England, and she, in return, seized upon the colonies, and destroyed the commerce of France. The English, of course, amused themselves very much at the Emperor's expense, and we recollect a caricature that had a great run at the time representing the imperial family employed in making this sugar; Napoleon himself standing at a tub, with his arms dyed to the elbows in a liquid whose crimson color might have a double meaning, and the little king of Rome sitting on the floor, and sucking a beet root for his supper .-But in spite of smuggling and ridicule, and, worst of all, of peace, which brought back the West India article, the manufacture of beet-sugar continued to flourish, and seems to have thriven all the better for being deprived of imperial patronage.-In fact, it has gradually extended itself until, at the present time, it seems there are more than sixty manufactories of this article in the various parts of France. One of our latest Havre papers we see mentions that two new establishments for making this sugar were about to be set on foot near Valenciennes, and another on a large scale near Paris. And in proportion as the manufacture has increased, it has been improved by the science and art of the practical chymist, particularly in the boiling and chrystallization, till it is thought that the manufacturers will soon be able to afford their sugar made in this way, as cheap as that which is imported from the East or West Indies .- N. Y. Jour. of Commerce.

HEMP.

The high duty on hemp, canvass and duck, will, for a time, be a matter of some inconvenienceand the only way to obviate it, is to set about the business of cultivating hemp, and manufacturing the articles from it that are needed. This may he made a profitable business. We are not aware that any considerable quantity was ever raised in this State; but there could not be a better region for it. It is a hardy plant, and will grow in almost all climates. It is grown in India, in Italy, and Russia. It may be cultivated throughout the whole extent of the United States. Our thrifty housewives will tell you, that it will flourish luxuciant here, for it is their custom to scatter a handful of seeds by the side of their bee-house, where it springs up and grows without care or attention, end continues to blossom and yield food for bees antil they retire into winter quarters. One sowing, for this purpose, is sufficient. It will spring up year after year like the common weeds, from the seed which sows itself. There could not be a better or more suitable and profitable erop for 200w lands. It yields from six hundred to a thousand pounds of clear hemp per acre, and when properly prepared, brings, in the market, if of middling quality, two hundred dollars per ton. The principal labor is in the dressing and preparing. It should be water-rotted. Every town furnishes conveniences for doing this, and a little experience will soon enable one to regulate this part of the business understandingly.

There has been a prejudice against American

hemp which has prevented its use; but this prejudice arose from the improper manner of preparing it. It has been found that the fibre of American hemp is better and stronger than the Russian, when prepared like it. This has been proved by the experiments of the navy commissioners, who were directed by Congress to institute a course of experiments on the subject .- Farmers' Journal.

PREMIUM ON MULBERRY TREES.

These trees grow readily in our soil, and require scarcely more attention than is given to the common forest tree. But gardeners and agriculturists have not yet taken the precaution to prepare nurseries of them for an extensive supply .-If our enterprising husbandmen therefore wish to set these trees out in great numbers, we fear they must go beyond the confines of this State to obtain the Isabella, may still make their barren vines the best kinds and in sufficient abundance. Un- productive, and improve those which bear the sour der these circumstances we respectfully suggest to and inferior kinds of the common wild grape, by the Middlesex Society of Husbandmen and Manufac- budding them with the white and pale red varieturers, the propriety of offering a premium for the ties, which may be procured in almost every town. best mulberry orchard, to contain not less than Worcester Spy. fifty trees, which are not less than three years old. A premium of ten or twenty dollars would turn the thoughts of farmers to the subject, and, in a few years, they would have as many mulberry trees in progress as would be wanted for the cultivation of silk. A premium might also be proposed for the best mulberry nursery, which should contain not less than five hundred or even a thousand trees, not less than one year old. When the directors of the Middlesex Society of Husbandmen meet to propose premiums, we trust this subject will not be overlooked or forgotten .- Concord, Ms. Gazette.

INOCULATION.

The time for budding fruit trees has arrived, and we hope that it may be more generally improved than it has been heretofore. The principal reason why more good fruit is not cultivated. is that it takes so long to get the trees in a bearing state. There are few farmers, however, who following. have not good apple stocks for inoculation, the fruit of which now is of little worth. If these were budded the present season, in three or four years they would begin to yield fruit. The difference between indifferent fruit and that of the best kind is so great, that few we should hope would forego a luxury so cheaply to be obtained.

In the Spy of the 2d instant we made some remarks on the practicability of a more extended application of grafting and inoculation, and alluded more particularly to the inserting of the Madeira was left uncovered, or to resist decay, if sheltered nut, or English walnut, on the butter-nut stock. A during the winter. friend of ours who has cultivated that nut, and who has inoculated almost all kinds of trees, says that the Madeira nut tree so nearly resembles the butter-nut and black walnut, that he has no doubt of its growing well in either of them. We hope the experiment may be made, particularly in those parts of New England, where the winters are most mild, and best adapted to the rearing of this nut. We hope, also, that some of our neighbors may try the experiment of budding the improved poorer quality, and also upon the piguut tree.

In confirmation of our former remarks, we find in the New England Farmer, a letter from a correspondent, who says he has four thousand scions growing, which were set this spring; among who have had occasion to practise the mystery of

and apricot, peach, and mulberry scions in plum tree stocks. The pear often does well in apple stocks, and generally does so in the quince and wild plum or shad bush.

But we would direct the attention of our farmers particularly to the cultivation of the grape .-The wild grape vine grows spontaneously almost every where. Many of the vines are barren, and a considerable portion of those that are not, yield fruit of but little value. These might be inoculated with kinds that are valuable, and thus rendered productive and profitable. The Isabella grape, a species recently introduced into New England from North Carolina, is found to combine in a remarkable degree, the excellence of the imported varieties with the hardihood of our native grape, and is altogether superior to the best of the latter kind. Those who cannot procure buds of

From the Worcester Ægis.

CULTIVATION OF THE GRAPE.

The cultivation of the Grape has become an interesting object of attention. The experiments which have been made, go far to show that the varieties suited to our climate may be made to flourish and be productive of delicious fruits for the table, uniting the luscious coolness of the melon with the rich flavor of the peach and pear, at an expense not exceeding that of rearing the Indian corn. On a small scale, the vine may be trained over fences or buildings, to cover their sides with the deep verdure of its leaves, and wreath their summits with its graceful festoons.

Judging from personal knowledge and the statement of writers of approved judgement, we are induced to believe that inoculating grape vines is liable some objections: among others to the

1. The operation would be difficult for those not very skillful in the use of the budding knife. 2. The vine from which the bud was cut would

be destroyed by bleeding. 3. The stock into which the bud was inserted.

would be killed from a similar cause. 4. The operation, if practicable with safety, would be comparatively useless: for the shoot sent out from the bud, if it should live, could not ripen so far as to bear the frost when the vine

5. It is decidedly the most difficult, dangerous, and ineffectual method of all devised for the pronagation of the vine.

The vine is commonly propagated from seeds. layers, cuttings, or grafts; by seeds for the purpose of obtaining new varieties of delicious fruit : hy layers to furnish strong and large plants the first year; by cuttings for vigorous and healthy vines and for the facility of the operation; and by graffing, in the early spring, into the root, below varieties of the shagbark walnut, upon those of a the surface, for the purpose of changing the character of the fruit.

The danger of making incisions in the vine at any other period, than when the frost has checked the circulation, is familiarly known to those which are pears in locust and forest hazel stocks, pruning. The horizontal branches may be re-

further care of his plant. A reason as strong dustrious, but gives sparingly and almost refuses plete relief, and if there are no symptoms of paraagainst the practice may be found in the fact, that every thing to the negligent. if the buds are allowed to remain on the parent stalk until the wood is ripened, they may, at the season of pruning, be safely separated, and by covering with earth, converted into new vines with vigorous tops and sound roots.

The method of propagation, which is called that perienced cultivators and judicious writers. Its advantages are, great economy of labor, increase of the number of plants, certainty of obtaining the In the autumn when pruning takes place, the shoots taken from the mature wood are cut off and separated in pieces. Some cultivators leave them eighteen inches long; others form them with only one eye on wood of one year old and a few inches of that of the preceding year: by a third method the cuttings have only a single bud. The cuttings thus prepared are preserved through the winter, by covering them with earth. spring they are inserted so as to leave one or two buds above the ground, and freely send out shoots and fibres. This we believe is the easiest and best method known for propagating the vine.

THE VINE.

A number of gentlemen held a meeting in Baltimore, in June last, to form a society to promote the culture of the vine. Such is our opinion of the nature of their object, that we think there is scarcely any thing calculated to prove so useful to the country, as this undertaking, if successful .-They propose to hold fairs for the exhibition of wines, about the time of vintage. Dr Monkur delivered an address at the meeting, which contained some interesting facts about the culture of vines in the different climates of Europe, with a statement of the comparative degrees of latitude in the United States .- N. Y. Statesman.

HORTICULTURE.

A proper attention to the science of horticulture has ever been considered among the blessings of civilized life; and it may be observed, that the more any country has advanced in the knowledge of agriculture and gardening, the further that country has progressed in civilization. It is very evident, that in this country, where liberty seems to have made her abode, and the rights of man are protected, that great progress has been made within a few years in the science of agriculture. Societies have been formed under the auspices of some of our most enlightened citizens throughout the country-considerable progress has been made, and by universal opinion, an excitement to much greater improvement is anticipated. This spirit has also extended to horticulture; -and almost every man possessed of a small piece of ed with advantage, contrary to the general opin-young ladies. CANADA THISTLES.

Having seen several articles in your paper relatby cuttings is that recommended by the most ex- ing to the Canada thistle, and having had the satisfaction of destroying everal bunches of them in a manner different from what I have seen described, I feel disposed to communicate it to the pubsame fruit with the original stock, convenience of lic. In 1822, I discovered the Canada thistle in cultivation, and the sure growth of healthy vines. a pasture where I kept about twenty sheep; I mowed them twice or three times in wet weather, but they appeared to grow the faster for it, and had, by the next spring, spread over three times as much ground as they occupied before, and were in a flourishing state. I caused them to be cut once more. I then took about two quarts of salt, and spread over the thistles, and the sheep being hungry for it, they very soon eat what they could, and continued upon the spot till they had stamped much of the grass and thistles into the dirt. I continued to throw on salt once or twice a week. for several months, and frequently put in other cattle, when they needed salt, so that the ground in a short time was almost bare, and what few thistles were to be seen were covered with rust. The next season I ploughed the ground, and have since planted and sowed it, and I believe there is now, not a single thistle on the piece. I discovcred another bunch of them in another piece the next year, which I treated in the same manner. and have now on the ground a piece of corn, but have the satisfaction to say, there are no thistles in the field. A FARMER.

LIGHTNING RODS.

Professor Fansher, of Yale College, says,-"In a dry atmosphere its influence extends to from 30 to 40 feet.

In a damp do, from 20 to 25 feet.

When it rains profusely, from 15 to 20 feet. From this statement it will be obvious that conductors should always be erected with reference to the most watery state of the atmosphere.

THE BIG WALNUT TREE.

This mammoth product of the American forest, which was exhibited in New York and Philadelphia, has been transported to London and sold for two hundred pounds sterling. It was found near Lake Erie, and measures 36 feet in circumference; its interior presents a splendid drawingroom.

APOPLEXY.

In giving the history of four classes of apoplexy, in which emetics appeared to have been exhibitblood through the lungs, or from its not being properly organized, than is imagined. A stomach

moved when the main shoots are in vigorous that to have flowers, fruits, and vegetables in per larges, are distributed, and therefore the lungs do lysis, and it is probable that the stomach contains indigested food, it is advisable to give an emetic. Edinburgh Journal.

> It has been estimated that the steam boats belonging to and trading from New York, consutor during a running season of eight months, about 180,000 cords of pine wood, to which may be added 20,000 cords for other modes of consumption, making in all 200,000 cords. At Philadelphia, we have 12 boats hesides ferries in constant use. which probably, with works and manufactories in the neighborhood and in New Jersey, use 150,000 cords per season, making an aggregate of the consumption of the two ports, 350,000 cords per aunum. This vast destruction must, we apprehend, exhaust the lands within reach of navigable waters in the course of a few years, when a substitute must be resorted to, or the cost will be heavily increased. It is fair therefore to calculate, that the day is not far distant, when a demand for 175,000 to 200,000 tons of coal annually, for the use of steam boats, will he added to the coal market .-Penn. Gazette.

The State of Pennsylvania is going on with great power and rapidity with the canal. About 8 miles of her canal, that is from Pittsburgh to the northern turnpike, will be in successful operation, it is believed, in about three months; the residue, about 30 miles to the western base of the Allegany mountains, will be put under contract on the 1st of September; and the rail road over the mountain, about 35 miles, will be under contract this fall, to be completed the next season .--The average number of hands employed this season has been above 4000, and the monthly disbursements of money, eighty or a hundred thousand dollars. The Pennsylvanians have reason to be proud of this great work, which they carry on in the only way in which important public improvements ever can be effected .- Nat. Intel.

I'rom the number of milk-men I observed passing the Brooklyn Ferry, I was led to enquire the quantity of milk carried to the city each day from Brooklyn. I find it is 975 gallons, or 3900 quarts, which at 6d. is \$234 00 per day; \$1638 00 per week, and \$83,176 00 per year; and at a season when perhaps the least is used. I could not guess the extent of pasture it would require to supply such a vialactra, though A YANKEE.

BOSTON, FRIDAY, AUGUST 1, 1828.

TAKING HONEY.

A writer for the American Farmer, vol. v. p. 72, gives the following description of a mode of taking honey adopted by a gentlemen of his acquaintance. "He has no need of cap, mask, or gloves-so far from shielding himself, he rolls his sleeves up above his elbows, and goes at it when the sun is at its meridian, knowing that the bees are all at that time from home. The brighter the sun the better, and the month of August is his honey harvest. When he goes, at mid-day, he takes off the top of the hive, and takes out as much honey as he thinks proper-nails on the top, and goes on to another, and another, until he is done. The honey is as nice and white as it can be-the bees immediately fill up the vacant place, and the next year you have nice new honey again."

TO PRESERVE HAM, &c.

A writer in a Southern paper states that he has for more than twenty years past kept meat hanging up in his smoke house, through the summer season, and no fly, worm or bug has injured it.

"To prevent such injury about this time of year I take a strong ley made of wood ashes. I commonly boil it to make it stronger than it generally runs off; then I take my bacon and smoked beef, having two or three gallons of the ley in a large iron bottle, and take each piece of meat and dip it into the ley, so that it is completely wetted with it, then I let it dry-then I hang the meat in its former place. By this process I have invariably found that it kept the meat free from bugs and worms, and no taste of ley is ever perceived, even on the outside."

DR. COOPER'S AXIOMS IN FARMING.

I. Two crops of grain should not succeed each other; they should be separated by potatoes, clover, grass, turnips, beets, or carrots for fall feed- position, and, diving into it, immediately drown.

2. Good agriculture requires no naked fallows: fallow crops [any hoed crops] that compel you to keep the ground clean while they are growing, answer the purpose.

3. Manure once in four years.

BRAKES.

brakes can be destroyed effectually, by pulling them up by the roots, in the month of June, when their roots are short, and they start very easily .-It may be necessary, in some cases, to go through the process the second year, though they seldom require this trouble.

LUXURIANT GROWTH.

Mr. J. W. Warren, of Weston, has left several spires of Timothy or Herds-grass, at the office of the New England Farmer, measuring five feet three inches in length; the heads of which measure between nine and ten inches.

GARLICK.

when the fall fever raged violently in the neighborhood of a canal, then in a state of progress, numbers of the workmen engaged on it eat plentifully of garlick, and wholly escaped, while those who abstained from the use of this article were severely afflicted by the disorder.

William Prince, Esq. Proprietor of the Linnæan Botanic Garden, near New York, and his sons Mr account of the variety of its soil and climate, veg-William Robert Prince and Alfred Stratton Prince, etation is more or less rapid, in different parts, and have each been elected members of the Paris Hor- also in different seasons, be fixed upon for the ticultural Society, which is now progressing in its operations with the greatest success, and has already published nine numbers of its Transactions. Triplicate copies of these works have been transmitted to the gentlemen above named by the Che- brownish colour of their seed. When they arrive valier Soulange Bodin, who has been appointed at this state of maturity, no time should be lost in Secretary of the Society; and one copy has been presented by the Mess. Princes to the Hon. John Lowell of Roxbury.

FINE FRUIT.

inches in circumference, picked a few weeks since from the bushes, can be seen at the New England Farmer Seed store, preserved. They are of the picked, they ought to be immediately carried to same kind of those advertised and sold at this place last spring. Likewise white and red Dutch Currants one inch in circumference, bushes of which will be for sale at this place the ensuing ering of hair cloth. The oast, previous to the autumn and spring.

CLOVER - Query.

It has been suggested by a German farmer that in Holland, in an unfavorable season for making hay, it is enstomary to put down clover, green salted, in vats. It is eaten with avidity by cattle, during the winter. A correspondent in Salem wishes to know if any thing similar has ever been adopted in this country?

THE BEE MILLER.

The following method of destroying a very pernicious insect has been recommended, and is at least worth the trial. To a pint of sweetened water (sweetened with sugar or honey) add half a gill of vinegar; set this in an open vessel on the top of the bive, and at night, when the miller comes to his work of destruction, he will prefer this com-

Extract from a letter to the Editor of the New England Farmer, dated Brownsville, N. Y. July 20, 1828.

This has been the wettest season remembered in this part of the country. Our wheat for many miles around is badly rusted, so that we shall not get half a crop. The price of wheat for several A friend in Andover informs us that common years, has been with us from fifty to seventy-five cents per bushel; it is already a dollar, and instead of sending a large supply to the New York market, we shall not raise enough for our own consumption. Our hay crop is very good, but we have difficulty in harvesting it without damage from rain.

CULTURE OF HOPS.

The New Brunswick Courier, in recommending the culture of Hops in that province, as an article of export, gives the following information respecting the best mode of gathering, drying and bagging, which we copy for the benefit of our agricultural readers.

As the culture of the hop plant concerns the A writer in a Philadelphia paper states that individual who follows it, as a means of living, more than those who could, from convenience, and other local circumstances, render it an item of profitable domestic produce, our observations at this time, are confined to preparing it for a market, under the different heads of gathering, drying, and bagging.

No specific time can, in this country, where, on gathering, or picking of hops :- good judgement, and experience, therefore, are the surest guides to be followed. Their ripeness is to be ascertained, by their strong scent, their hardness, and the having them expeditiously picked, as in the event of a heavy rain falling, they would be bruised and discolored, and thus rendered less valuable in the market, than such as are picked, bright and clear. Special care ought to be observed, also, to pick Scotch Gooseberries measuring four and a half the hops when they are dry, and the weather fair.

The drying of the hops is the next part of the process to be attended to. After having been the oast or kiln. This building is similar in its construction to a brick-lay'd kiln, for the drying of oats; only, that the floor is overlaid with a covhops being laid upon it, ought to be moderately heated by a fire of charcoal, and the heat not suffered to be diminished, during the course of drying, but rather increased. The hops are to be laid on, a foot, or a little more, thick, and allowed to remain, without being turned, for the space of nine hours, and in two or three hours afterwards, they will be fit for bagging. This may be ascertained by the brittleness of the stalks, and the easy falling off of the hop leaves. The turning of the hops at all, is considered to be injurious rather than otherwise; to prevent this, therefore, oasts ought, where bop-curing is carried on upon an extensive scale, to be furnished with a movcable tin cover, let down to within a foot of the surface of the hops,-this will render the oast close, and the heat will be reflected upon the hops, in nearly an equal degree, on the top as at the bottom.

The mode of bagging is simple, and can be managed to suit convenience, and particular circumstances. It ought to be attended to, immediately on the hops being removed from the oast, and put into strong coarse linen bags; the bags must be placed in such a situation, as to admit of persons stepping into them, in order to tread the hops down, as they are gradually put in. Thus put up, they will keep for several years, provided they be lodged in a dry place, and defended from the ravages of vermin.

IMPROVEMENT IN VEGETABLES.

There is scarely a vegetable which we at present employ that can be found growing naturally. Buffon states that our wheat is a factitious production, raised to its present condition by the art of Agriculture. Rice, rye, barley, or even oats, are not to be found wild, that is to say, growing naturally in any part of the earth, but have been altered by the industry of mankind, from plants not now resembling them even in such a degree as to enable us to recognise the relations. The acid and disagreeable apium graveolens has been thus transformed into delicious celery; and the colewort a plant of scanty leaves, not weighing altogether half an ounce, has been improved into cabbage, whose leaves alone weigh many pounds, or into a cauliflower of considerable dimensions, being only the embryo of a few buds, which, in the natural state, would not have weighed many grains. The potato, again, whose introduction has added ma-

ny millions to our population, derives its origin from a small bitter root, which grows wild at Chili and at Montevideo. If any of my readers should be scentical upon the subject of such metamorphosses, let them visit the fairy bowers of horticulture, and they will there perceive that her magic wand has not only converted the tough, cariacacious covering of the almond into the soft and melting flesh of the peach, but that, by her spells, the sour sloe has ripened into the delicious plum, and the nustere erab of our woods into the golden pippin; that this, again, has been made to sport in almost endless variety, emulating in beauty of form and color, in exuberance of fertility, and in richness of flavor, the rarer production of warmer regions and more propitious climates .- Dr. Paris on diet.

COOKING POTATOS.

Of all the good things which nature produces, through the patient industry of the farmers, there is nothing which is so agreeable to the palate as the potato, nor any one vegetable so universally esteemed, yet this is so frequently rendered unpalatable by the manner of cooking it, that but comparatively few are acquainted with the real flavor of this esculent root. Lovers of mealy potatos will do well to attend to the following method, communicated to us by a lady of this town, whereby potatos a year old may be rendered as delicious as new ones boiled in the common manner. Peal them, put them into cold water, and let them remain two or three hours; then boil them in water which has been salted, observing that it boils when they are put in; pour off the water when they are done, shake them well for a short time, put them on the fire again, and at the expiration of ten or fifteen minutes, they will be ready for the table.- Lancaster Gazette.

We continue to be visited with frequent and severe thunder storms. The storm which passed us on Saturday morning was severely felt to the north, at New Ipswich, Ashby, Fitzwilliam, &c .-We are informed that three horses in one stable were killed by lightning in Fitzwilliam, and that a man in the act of cleaning one of the horses was struck down and somewhat injured at the same time. Two hogs were also killed in Ashby .-The storm of Sunday night, which was severe but of very short duration here, was felt with extreme severity in the towns abovementioned .- Ibid.

SILK.

According to the latest accounts from the southern countries of Europe, where silk is a principal object of trade, all the silk-worms are in a thriving condition, and promise an abundant crop. In Smyrna, Broussa, and other ports of Asia Minor, no fears are entertained for this year's supply.

The Coffee Crop in Hayti is said to have fallen short. This is a great calamity, as the Government and People depend almost entirely upon it.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thrty miles of Boston—for which a fair price will be given. Address "P. D," Boston, through the post-office.

Wanted.

A young man is wanted, to attend to the sales of a Milk Establishment, who can produce the most undubted recommendations—none other need apply. Liberal wages will be given. Apply at the New England Farmer Seed Store, No. 52 North Market-street.

German Geese.

For sale, two pairs of this superior breed of Geese, from East Friezland, Germany—produced from a pair imported last year direct from Bremen, in ship North America, Capt. Child; and which were selected by said Capt. himself, with the greatest care. These geese possess many important qualities peruliar to their breed—among which is, their size, their usual weight when fat being from 25 to 30 pounds each—also the large quan-tity of feathers which they yield, the Germans pluck them three times a year, and the feathers are considered the best in the German, English and Dutch markets—and their remarks— by docile. reentle and domestic dispositions. Apply to Capt S. For sale, two pairs of this superior breed of Geese, from East by docile, gentle and domestic dispositions. Apply to Capt S.
P. Child, Warren R. I. where the geese are to be seen—or to Wan. B. Bradford, Jr. No. 24 India street, head of Central wherf, Boston—or to the New Eegland Farmer Seed Store. July 18

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Horticulturalists in the vicinity of Boston and New and Practical Mortconturants in the vicinity of Dosside and New York, is just published by J. B. RUSSALL, Proprietor of the New England Farmer. The artirles are a raringed alphabetically, and comprise the most useful Vereta Less and Freurs which can be conveniently and economically cultivated in the climate of New England and the Wildle States; as well as a Treatise on FLOWERS, and on LANDSCAPH or PICTURESQUE GARDENS, on the general management of the SILK WORM, and the manufacture of SILK, and a Treatise on the culture of GRAPE VINES and the STRAWBERRY. The article on Fruit Trees contains an enumeration and description of all the Apples-Trees contains an enumeration are uessemment, as not appreciate Pears, Pearhes, Cherries, Plums, Nectaines, Apricots, &c. &c. that can be raised to the most advantage, and their relative forwardness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orthards. Each of the above

becelt to genieure in mying out or tenness. Each of the more article is intrished by genlemen practically acquainted with the subjects on which they have written.

The following is the General Index of the book, which is superadded to a Calendarial Index, giving directions for perform, my the work of all the months in the year as they follow in succession.

Apple	Elecampane	Mulberry
Apple tree	Endive '	Mushroom
Apricot	Espaliers	Mustard

sixth copy gratis, for his trouble.

Imported Cow for Sole.

For sale, an Imported Short Horned Durham Cow, and Buil Calf, three weeks old, from the Caelebs stock, of remarkable good size and form; color red and white, handsomely mixed. The last year's Calf (a heifer) from the same Cow obtained a premium at the Brighton Cattle Show in October last. Inquire at the office of the New England Farmer.

Barefoot and Serab.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Coffin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barelooi, a chesuot horse, is as follows.

FOALED 1820.

Barefoot, by Trump, døm Rossmond by Buzzard, out of Rossberry, sister to Huley and Tartar, by Phenomecon, out of Miss West by Matcham- Regulus—Crab—Childers—Bastd. In 1822, when at Pontefract, sweepstakes of 20 gs. each, for two years olds—Il subs. Barefoot beating Harponeer. In 1823, York Springs St. Ledger, of 20 gs. each, f. subs.—Barefoot beating four others.—A, Pontefract sweepstakes of 30 guiceas each ten feet, 10 subscribers. Barefoot beating Palaune.

In 1823, the Donraster great St. Ledgers, of 25 gs. each, 20 subscribers. Barefoot heating 11 others. In 1823, at New Market, Barefoot won a handicup plate val-

In 1823, at New Market, Barefoot won a handicup plate value £50, beating Tressilinn and five others.

In 1824, at Ascot Heath, Barefoot walked over for the Swin-las stakes, of 25 souvereigns each 3 subs.

In 1825, at Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 10 sovereigns, 17 subs. of all ages. Eareford beating Lottery and two others.

In 1826, at Manchester, Handicup stakes of 30 savereigns each, 10 ft. with 20 sovereigns added—6 subsectibers—Barefoot beating two others.

heating two others. At Lancaster, the gold cup, value 100 gs. added to a sweepstakes of 10 sovereigns cach, 9 subs.—Barefoot beating two others

toot beating two outers.

SERAB, (a beautiful bay Horse.) FOALED IN 1821.

Got by Phantom out of Jesse, by Totteridge—her dam Cracker by Highlyer, out of Nutcracker, by Matesim.

In 1824, won the New Market stakes, 50 gs. each, 21 subs.—

Serah heating four others.

Serah heating four others.

In 1825, at the New Market Craoc meeting, the stakes, 100 sovings. 7 subs. Serah beating two others. The same year, Spring meeting. Serah won Handicup sweepstakes, 100 sovings. 6 subs. beating three others.

In 1826, Serab won Kings Plate, 100 gs. beating 30 others. In 1827, Stocton, Serab won the gold cup. j.13

MISCELLANIES.

RECORDS OF WOMAN.

BV MRS. HEMANS.

The following is the picture of Gertrude von der Wart, whose devotedness to her husband on the rack is well known.

Her hands were clasp'd, her dark eyes raised, The breeze threw back her hair; Up to the fearful wheel she gazed-All that she loved was there. The night was round her clear and cold, The holy heaven above, Its pale stars watching to behold The might of earthly love.

"And bid me not depart," she cried, " My Rudolph, say oot so! This is no time to quit thy side; Peace, peace, I cannot go. Hath the world ought for me to fear When death is on thy brow ? The world! what means it ?-mine is here-I will not leave thee now.

I have been with thee in thine hour Of glory and of bliss; Doubt not memory's living puwer To strengthen me through this! And thou, mine honor'd love and true, Bear on, bear nobly on! We have the blessed heaven in view, Whose rest shall soon be won."

And were not these high words to flow From woman's breaking heart? Thro' all that night of bitterest wo She bore her lofty part; But oh! with such a glazing eye, With such a curdled cheek-Love, love! of mortal agony, Thon, only thou should'st speak !

The wind rose high-but with it rese Her voice, that he might hear; Perchance that dark hour brought repose To happy bosoms near, While she sat striving with despair Beside his tortured form. And pouring her deep soul in prayer Forth on the rushing storm.

She wiped the death-damps from his brow, With her pale hands and soft Whose touch upon the lute chords low Had still'd his heart so oft. She spread her mantle o'er his breast, She bath'd his lips with dew. And on his cheek such kisses press'd As hope and joy ne'er knew.

Oh! lovely are ye, love and faith, Enduring to the last! She had her meed-one smile in death-And his worn spirit pass'd. While ev'n as o'er a martyr's grave She knelt on that sad spot, And, weeping, bless'd the God who gave Strength to forsake it not!"

filth used for smoking," from being imported into this withering world. One trembles, lest an imthe celestial empire.

A worthy knight and citizen was asked, a few days ago, to explain the term statu quo, which he did in the following manner: "Why, statu quostatu quo belongs to the fine arts-you all know what co is-co is latin for company, as we see it

is-well, a statue by itself is nothing more than a statu, but when there is more than one statue, as, for instance in the case of Gog and Magog at Guildhall, or the men at St. Dunstan's, why then that is statue and co .- that is the latin statu quo."

From the Zion's Herald.

ANCIENT BURYING GROUND.

While at Pittsburg, Penn. in May, the Rev. Mr. Gwinn, an aged and respectable member of the general conference, related to me some circumstances respecting ancient burying grounds, in the section of the country in which he resides, which appeared to me of an interesting character. Having a desire to retain the facts, he very kindly gave them to me in writing; with permission to least of all are permitted to disturb our friends, make any use of them I pleased. My informant said that he had examined those grave-yards himself, and could attest to what he had written-the substance of which I forward for your insertion in the Herald, if you think it worthy a place.

New Bedford, June 26, 1828. J. SANBORN.

near the town of Sparta, there have been discovered three burying grounds, where a very small people are deposited in tombs (coffins) of stone .--The greatest length of the skeletons is nineteen inches. Some of these people appear to have lived to a great age-their teeth being worn smooth and short, while others are full and long. Many of the tombs (graves) have been opened, and the skeletons examined. The graves are about two feet deep; the coffins are of stone, made by laying a flat stone at the bottom, one at each side, lish poetry shall endure) in the exquisite inscripone at each end, and one over the corpse. The tion on her monument in the Cathedral of Bristol, dead are all buried with their heads to the east and in order, laid on their backs and their hands on their breasts. In the bend of the left arm is

seven to nine fert long."

Childhood .- There is in childhood a holy ignorance-a beautiful eredulity-a sort of sanctity, that one cannot contemplate without something of the reverential feelings with which one should approach beings of celestial nature. The impress of the divine nature is, as it were, fresh on the in-The Emperor of China has prohibited "the fant spirit-fresh and unsullied by contact with pure breath should dim the clearness of its bright mirror. And how perpetually must those who are in the habit of contemplating childhood—of studying the characters of little children, feel and repeat to their own hearts—"Of such is the king-tlom of heaven!"—Aye, which of us, of the wisest among us, may not stoon to receive instructions. among us, may not stoop to receive instruction what co is—co is latin for company, as we see it among us, may not stoop to receive instruction. Published every Friday, at 33 per annum, payable at the marked, you know Barelay & Co. Meux & Co.— and rebuke from the character of a little child?— and of the year—but those who pay within sixty days from the wrhenever it is more than one, it is always co. But Which of us, by comparison with its divine simine of subcribing fure childed to a deduction of fifty cents.

I will describe it to you -you know what a statue plicity, has not reason to blush for the littleness. the insineerity, the worldliness, the degeneracy, of

> Genius and Feeling .- Nobody possessed of common sense or common sensibility would offer consolation to one who had just lost a beloved wife. Sympathy is the only thing that the ease will admit of. The subjoined letter is not excelled, perhaps is not equalled, by any similar effusion .-The very peculiar circumstances under which it was written might have deterred a friend less anxious, or a writer less confident in the expression of what he felt than Mr Gray .- Charleston Courier.

MR GRAY TO MR MASON.

"I break in upon 'you at a moment when we only to say that you are daily and hourly present to my thoughts. If the worst be not yet, you will neglect and pardon me; but if the last struggle be over,-if the object of your long anxieties be no longer sensible to your own sufferings, allow me, at least in idea, (for what could I do, were I present, more than this?) to sit by you in silence, and "In the county of White, State of Tennessee, pity from my heart, not her who is at rest, but you who lose her.

" May he who made and he who afflicts us, the Master of our pleasures and of our pains, support you!—Adieu.

"I have long understood how little you had to hope."

It need scareely be added that the amiable woman whose extreme illness prompted Mr. Gray's anxious inquiry, was she whom her husband has immortalized (so long at least, as Eng-

" Take, holy earth, all that my soul held dear," &c.

Turnip Seed, &c.

on their breasts. In the bend of the left arm is found a cruise or mug, that would hold nearly a pint, made of ground stone, or shell of a gray color, in which is found one, two, or three shells, supposed to be sea shells. One of these skeletons had about the neck 94 pearl beads. There are many of these burying grounds. Near the one which I examined is the appearance of an ancient town. The bones found in these graves are strong and well set, and the whole frame appears to be well formed. These grave-yards are in extent from half an acre to an acre and an balf.

In the same neighborhood is a burying ground where the dead are buried in the same manner as above described, and where the skeletons are from seven to nine feet long."

Turnip Seed, &c.

Just received at the New England Farmer Seed Store, No. Sent Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the present season—the finest soils, either for family use or stock. The most some series are the growth of the present season—the finest soils, and the White Stone, White Clobe, and I feltow Stone is defend about the finest spickles are preferable and keeps well. Of the sorts one feld culture, the White Norfolk, White Globe, and I feltow More in feld culture, the White Norfolk, White Globe, and Seolland, as in a supported among the farmers of England and Seolland, as in growth of the present season. The Yellow Abore is most approved among the farmers of England and Seolland, as in growth of the present season. The heaves seeds were saved in Europe expensive forms and the under the season many the farmer seed Store, No. Sone of which are the growth of the present season when are the growth of the present season when are the growth of the present season when are the growth of the present season when the finest pickles are the Stoley. It delivers the store of the present season when the finest pickles. Likewise 200 lbs. feet of the setting and the present season when are the growth of the present season when are the

Likewise 200 lbs. fresh common white flat English Turnip Seed, a part of it the growth of 1828:—to dealers and purchasers by the quantity, it will be put at a low rate.

Out Meal, Out Flour, Grotts, &c. Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine bolted Oat Flour, Hulled Oats or Vermont Rice. Scotch Barley, &c. fur sale in any quantities, wholesale or re-tail. Also a few cannisters of fine Oat Flour, neatly packed, at 50 cts. per cannister.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

FARMERS' WINTER EVENINGS.

No class of the community have more leisure during the evenings of winter, than practical farmers: and it may, perhaps, be a question worthy their consideration, whether those living in the same neighborhood, can enter into any arrangement, to appropriate a portion of this leisure time, to aiding each other, in the cultivation of their social, intellectual and moral faculties, or in the skill and success of their important and dignified employment.

The instruction and pleasure received by myself, a winter or two since, at weekly meetings with a few practical farmers, are fresh in my recollection: and two volumes of notes taken from statements of the observation and experience of the various members of the association, still remain, as satisfactory proof, that social, intellectual and moral improvement, was not the only advantage derived from the meetings, but that much practical instruction was received by all who attended them.

If I understand the object of a few articles of association, entitled "American Lyceum," published in your last number, it is to furnish farmers and others, with an opportunity to aid each other well-known that those branches of the Lyceum, already in operation, have had many practical and interesting discussions and communications, both upon agriculture and the mechanical arts, as well as the other various relations of human society.

It is hoped that farmers in every town in New England at least, will give the subject an early and serious consideration; and that many will be induced to make arrangements, to devote a few evenings of the approaching autumn and winter, to the benevolent and dignified object of aiding each other in the improvement of their minds, their hearts, and their farms.

On a future occasion I may ask a place in your paper for a few practical questions upon agriculture, as proper for discussion at social meetings. FRANKLIN.

FOR THE NEW ENGLAND FARMER.

STACKING HAY.

MR FESSENDEN-Perhaps it may prove beneficial to communicate to the public a mode of stacking which has been put in practice in this town. A foundation being laid adjoining the side of a barn, proceed to mow up the hay in a square or oblong body, quite to the eaves on the barn, on the inner side of the mow or stack; and on the outer side to such height as to give a proper descent. Drive into the plate three or more hooks, directly under the gutter. Lay on the outer side of the stack a joist to support the rafters, which should be of sufficient length to reach from the hooks (with which they are connected by plate hinges riveted on the under side) to the outer edge of the stack; the rafters to be covered with boards, laid on clapboard fashion. This roof may sault of this destructive insect.

be raised and lowered for the purpose of putting in and taking out hay, and will effectually secure the top of the stack from wind and rain.

DORCHESTER.

FOR THE NEW ENGLAND FARMER.

DESTROY THISTLES.

Ma. Fessenden, -I was pleased to observe in your last, the subject of the Canada thistle again brought to view. I allude to the piece signed "a farmer," from the Massachusetts Spy, [page 13 of the current volume.] I have no doubt of the effieacy of salt, or strong brine, in destroying this worst of all pestiferous weeds. I destroyed the most of what few I found on my farm last year, with some refuse beef brine, without the trouble of cropping them down; though I think it best to crop them, even under ground. Indeed the cropping or cutting down, should be attended to before this time of the year, if nothing more is done; in order to prevent their spreading. Its downy seeds are now in this vicinity wafted about in the air by every wind-they just begin to be let loose, and Almanac. will propagate far and wide. It is matter of astonishment, that so little attention is paid to the subject. Farmers were informed several years ago, of the efficacy of the above method of destroying the thistle, or one quite similar, in vol. ii. p. 411 of the New England Farmer, and yet they still neglect to make use of it.* I understand some subjects relating to their professions. Indeed it is subject worthy their attention. But much mighbe done by individuals, if all would be awakened to a sense of its importance.

> Salt, that has been used for salting imported hides, and for salting the bottoms of vessels may sometimes be purchased for a trifle; and farmers may be assured that if applied, it will destroy thistles, as well as any other tree or plant.

Lunn, Aug. 4, 1828. A FARMER.

* The following is an extract from the passage alluded to: "Cut off each thistle about half an inch below the surface of the ground, and then put on it a gill of coarse salt. Fish brine may be used instead of salt, and will answer the same purpose. If in a bed of these thistles, a few should escape the first year, the above operation should be carefully performed on them the year following. The summer season, when the thistles are in full growth, is the proper time for doing this business,"

THE SEASON.

Extract of a letter to the Editor of the New England Farmer, dated Florida, N. Y. July 29, 1823.

We have had a very favorable season, our crops of all kind are good. Barley (our staple produce) is remarkably fine, and is now going rapidly into our barns. Our meadows were never better, and our fields of Indian eorn are luxuriant-while our gardens please the eye, and contribute an abundant supply for the kitchen.

Preventive against moths .- Calamue, or sweet flag root cut in thin slices and scattered among woollens of any kind, will effectually repel the as-

AUGUST.

From the middle of August to the middle of September is said to be the best time for sowing winter rye. By sowing early you provide green food for sheep late in the fall and early in the spring, and by early sowing, and feeding in the fall the roots of the grain take such firm and extensive hold of the soil that they are less liable to be thrown out of the ground by frost, or winter-killed. When sowed so early three pecks of seed will be sufficient. Preserve your sheep from the gad-fly, which causes worms in the head, by keeping their noses continually smirehed with tar from the middle of August to the latter part of September. If you mix a little fine salt with tar, and place it under cover where your sheep can have access to it no doubt they would keep their noses sufficiently smutted with tar to prevent the troublesome assiduities of the buzzing belligerent, who so often plants the seeds of death in the nostrils of one of the most useful and inoffensive of the four-footed friends of the farmer .- New England Farmer's

HORN SHAVINGS.

from chips and shavings can be procured in considerable quantities wherever the manufacture of combs is extensively carried on. They are admirably prepared for the purposes of manure, either for tand under tillage or as a top dressing for grass grounds, and when judiciously applied in either case, they have seldom if ever failed to make a rich return. As a manure for potatos and corn they are found valuable; when applied to either at the time of hilling, covering them with the soil, the good effects are immediately perceptible. The application of fifty bushels to the aere at the time of seeding a field of rye, in the autumn, would much improve the crop, and much more improve the land, if to be laid down to grass. It has been thought, that laying in a dry sandy soil, under grass, in a dry season, was injurious : it is probable, under such circumstances, the erop was not benefitted, but if there was enough grass to cover the shavings from the scorehing sun, the succeeding crop would be materially increased by the application. But a situation in which there is no doubt of their efficacy, is, strong moist land under grass, the improvement of the crop from the first is very visible, and it continues for years. It is a warm, stimulating, permanent manure, and were it within reach of the generality of 'iarmers, more might be said to encourage them to use it. Let any one who has the opportunity make the trial of it, and he will hardly fail to discover its value. The usual price is about ten cents per bushel .- Notes to Davy's Agrie. Chem.

TURNIPS.

In Kent's Hints, page 128, is the following on turnips.-In crops they answer three great purposes ; to clean the ground ; support live stock, a vast deal; and prepare for other crops; particularly for barley and clover, or grass-seeds. The turnip crop is the Norfolkman's sheet anchor; and he spares it no pains. The stubble of wheat, barley, or oats, is preferred for bringing on turnips. They plough very shallow; so as to skim off the rough surface only, some time before Christmas. following March it is well harrowed (their soil is a sandy loam) and then is cross ploughed to its full depth. In May, it is ploughed again, the same depth, and if dry weather and the soil stiff, immediately harrow after this ploughing. By the first of June, it ought to be perfectly clean. Now, 10 good cart loads of manure are laid on an acre, regularly spread, and plonghed in quite fresh, half the depth of the other ploughing .- It thus is left till about the 21st. of June ; and then is well harrowed, to blend the soil and earth together .- It is then ploughed to its full depth, and harrowed, once only, the way it is ploughed. The seed is then immediately sown, on the fresh earth ; " not even waiting for the ploughing a second ridge. A quart of seed an acre is sown. The seed is harrowed in twice, the same way the ground was ploughed. The harrow is short tined, and the lighter the better.

The nicest part of the turnip husbandry now which all the former labor is thrown away .inches apart; without regard to the apparent sun. health in the choice of those left. About 10 or at hoed a second time, so as to stir the mould effectually between the plants, and to check weeds .-About 14 or 20 days after the 29th. September, dry land, every other ridge is drawn.

He adds, 20 acres of a good crop of turnips ues hot, daily water the plants. fatten 15 or 16 bullocks, and support 10 followers or store cattle for 25 weeks; or of sheep, as 8 to 1 ing, meliorating and preparing the soil for other their growth. crops.

To save turnips in the field, they sink some beds in the ground where they grew, about two feet mouth; and towards the latter end for successiondeep, of a considerable width, and lay 5 or 6 layers of turnips in them, one upon another, with a little fresh earth between two layers, and cover the top over with straw, to keep out the frost. Or pile them up in small stacks, with the greens outward, and a little clean straw between every two layers; and lastly cover or skreen them with wattles lined with straw.

† At Wye, with intention to try a new mode, my turnips were sown in broad-east, thick. A plough having a narrow fin without its mould board, was run through the young plants, carefully, for leaving them on a narrow slip of earth. Handhoes followed, working across the rows, and cutting near a foot width of the plants quite up; the hoers stopping occasionally to thin the clusters of turnips left by the hues. A double mould board plongh afterwards run through the intervals, heaves up the earth on each side and leaves the plants on clean ridges. Advantageous as this proved, I could not procure it to be repeated more than once more, a few years afterwards. Overseers are as fixed to old habits as the negroes under them; and I was much abroad on other business. I have indeed always found the negroes better disposed to execute my designs, than the overseers, who invariably are attentive and ingenious in taking short cuts for slurring over all work, to soon get rid of it and go a frolicking. I usually sowed near tho end of July though I felt disposed to break through the practice; and sow a little later, for saving them before they were old in growth when they incline to be open and spongy, and therefore do not keep so well as younger turnips, close and in full vigor. In that country turnips are but

KITCHEN GARDEN-AUGUST.

winter and the next spring and early summer crops; as cabbages, cauliflowers, onions, carrots, spinach, and some principal crops planted for late frost than the Strasburg onion. This never bulbs autumn and winter supplies. In this month, digging vacant ground is required for sowing and planting several fall crops. All new planted articles must be watered, and diligent attention paid to the destruction of the weeds before they grow large, or come to seed.

Asparagus, which will be now all run to seed, must be kept clean from weeds, which is all the culture they will require till October or November, then to have their winter dressing.

Sow cauliflower seed about the latter end of the month, to stand the winter, in frames, handglasses and warm borders, for the early and general summer crop, next year; and for which re- distance. mark the above time, for if the seed is sown earlithey will not attain due strength before that seas-

Earth up the former planted crops of celery, remost 14 days after the first hoing, the ground is peating it every week according as the plants adthe rows, but be careful not to clog up the hearts.

Cucumbers in frames, &c. may now be fully exthe turnips are fit for consumption, and so to April, posed by removing the glasses. Picklers, or these unless frost injures them.-Where the land is wet in the open ground, will now be in full perfection. three times a week. While the weather contin- them in the sun to dry, &c. as directed in July.

In dry weather hoe various crops in rows, to kill weeds, loosening the earth about, and drawbullock. But the greatest advantage is in clean-ing some of the stems of the plants, to encourage

> Sow cos, cabbage, and Silesia and brown Dutch lettuces, in the beginning and middle of the al crops the same autumn, and for winter supply, and to stand the winter for early spring and summer use. Plant and thin lettuces of former sowings a foot distant.

> Onions being now full bulbed, and come to their mature growth, should be pulled up in dry weather, and spread in the full sun to dry and harden, for a week or a fortnight, frequently turning them to ripen and harden equally for keeping. Then clear them from the gross part of the stalks and leaves, bottom fibres, any loose outer skins, earth &c. and then house them on a dry day.

> Sow winter onions both of the common bulbing and Strasburg kind, for the main crops to stand the winter to draw young and green, some for use

> people think would be destroying what they had done. They count the turnips by the number of plants, rather than by the quantity of the roots.

Turnips in rows, having 12 or 14 inch intervals. Every other row taken up and saved, would leave intervals 24 to 28 inches wide. Cover the remaining turnips with long dung: then in November, before the frost sets in, dip deep a double mould board plough, and heave the earth on the turnips, to stand the winter. Make the experiment. Such a plough is highly valuable on many occasions. It especially saves 2 or 3 bouts in clearing out, when ploughing maize. Of potatos every other row taken up would leave 3 feet intervals between the rows of remaining potatos. The haulm cut off and laid on these potatos, may then be covered by the earth heaped on them by a stout double mould board plough; for keeping this balf of the little boad and that slovenly; and to thin the plants the country crop through the winter. It may be first tried in a few rows.

in that season, but principally for spring supply : Several crops are to be sowed this month for and some of the common onions also to stand for early bulbing in summer. The common onion is mildest to eat, but more liable to be cut off by the and is of a stronger hot taste than the other, but so hardy as to stand the severest frost. The White Portugal Onion is the finest sort for fall

> Potatos may now be dug up for use in larger supplies than last month, but principally only as wanted, for they will not yet keep good long, from their not having attained their full growth.

> Sow an autumn crop of Radishes, both of the common short top and salmon kind. Likewise turnip radish, both of the small white, and the red, for autumn, and the principal crop of black Spanish for winter; and hoe the last sown to six inches

Sow the prickly-seeded, or triangular-leaved spiremains to be observed: It is hocing; without er, they will button or run in winter; and if later, nach, for the main winter crop, and for next spring that sort being the hardiest to stand the winter .-When the plants cover three inches in diameter, on. If the weather is dry, occasionally water Sow some in the beginning and some towards the hoe them with a 10 inch hoe; and set them at 15 them, and let them be shaded from the mid-day latter end of the month, each in dry-lying rich ground exposed to the winter sun.

Hoe the last sowed turnips eight inches distant in the garden crop; but large sorts, in fields or exvance in growth. Do it moderately on both sides tensive grounds, must be thinned ten or twelve inches or more.

Be particularly attentive to gather all seed that are ripe before they disseminate. Many sorts will now be in perfection; you must therefore cut the whole are drawn, and fed in cribs. On light Gather those for pickling while young two or or pull up the stalks, bearing the seed, and lay

MODE OF PRESERVING POTATOES.

The following process for preserving potatoes has been recommended by an English writer. which he states "will preserve all the nutritious parts of this valuable root for years."

"Let the potatoes be particularly well washed, then put into the cider mill and ground to a perfect pulp; put this pulp under a powerful press, (in hair cloths, as in cider making), and press it as dry as possible: then take it from the press, and put it upon the hop kiln, and carefully and well dry it; and then let it be packed in casks, or kept in any other manner, so that it be always prescried in a completely dry state."

KELP, OR CRUDE SODA.

[Concluded from last week.]

France was in the habit of depending principally upon foreign countries, for the supply of crude sodas, until the period of the revolution. In consequence of the wars lighted up by that event. she found herself cut off from the rest of Europe, and compelled either to abandon some of her most important manufactures, or to find within herself the means of supplying the raw materials. She was entirely destitute of many articles of daily, and indispensable use. Surrounded by enemies, she had not even the means of obtaining nitre for preparing gun powder for her armies. This state of things, and the great political excitement that existed at the time, resulted in prodigious and successful efforts, to supply herself from sources which had not before been thought of. The value of the physical sciences under these circumstances was perceived, nor is there perhaps a period in their history more honorable than this. No longer confining herself to the closet and laboratory, philosophy went forth, and relieved with her

^{*} In Maryland, turnip seed is usually sown a full month later

treasures, the distresses of the state. In the enthusiasm of the moment, the usual motives of human action seemed suspended; especially among men of science, every thing like private interest scenard lost sight of, in a desire to promote the public good. Important discoveries in the arts, which, if practised in secret, must have yielded immense emolument, were freely promulgated for the good of the republic. In this honourable competition of the sciences, chemistry stood pre-emi-The most eminent chemists in France, were formed into committees, by the committee of public safety; the results of their investigations will be found in the early volumes of the Annales de Chimie, forming the most valuable series of papers on chemistry, applied to the arts, that can perhaps be found in the history of the sciences.

Among the most important of these papers is the report of Messrs. Lelievre, Pelletier, d'Arcet, and Girard, on the best means of extracting soda from sea salt. This led to the extensive manufactory of artificial soda in France, which is at present not only principally employed in their own manufactories, but has become a considerable article of export. The process recommended by the committee, and which, with some modifications, is still practised, was invented by Messrs. Leblane and Dize. The process is briefly this :it consists in decomposing the muriate of soda, by sulphuric acid. The sulphate of soda, thus formed, is intimately united, in certain proportions, with charcoal and chalk pulverized. By the application of a suitable temperature, in a reverberatory furnace, a somewhat complicated series of chemical changes takes place. It has been supposed that sulphate of soda is decomposed, a part of the sulphur of the sulphuric acid, being consumed in the form of sulphurretted hydrogen, forms slight explosions, and exhibits the appearance of fire works, while the unconsumed sulphur remains in combination with a portion of soda and lime, forming hydro-sulphurets, sulphates, and sulphites. In the meanwhile, the carbonic acid of the lime, and that formed by the combustion of the charcoal, unite with the soda, and form the earbonate of soda. This part of the process requires considerable tact in its management, as the value of the article depends upon the completeness of the decomposition of the sulphate of soda, and the quantity of carbonate of soda that is formed. The process lasts about seven hours, and the residuum, thus obtained, resembles in its appearance, fine barill.

A considerable quantity of the artificial barilla. has been imported into the United States. In consequence, however, of the badness of the article in some instances, but especially from the quantity of sulphur that even the best contain, it is entirely fallen into disrepute. So little is it esteemed in this market, that the soap makers, who are the principal consumers, as several of them have declared to me, would not accept the article as a present, though they are sensible that it contains a large proportion of alkali. They find the ley, obtained by the lixiviation of the artificial barilla, contains so much sulphur, that when boiled and mixed with the other materials for making soap, the quantity of sulphuretted hydrogen disengaged, is so great, as to render the works almost untenantable, while the soap becomes of a dirty blue from the same market. Indeed, I have known colonr, and is rendered unsaleable.

Knowing that this substance is generally em-

there, I was induced to inquire into the cause of lately assayed a sample of artificial bari this, in order to ascertain whether the evil com- was sold at eighty dollars per ton, the priplained of, by our manufacturers, might not be the best in which there was scarcely an appreremedied. My attention was naturally first di- ciable quantity of soda, while a sample of Alicant rected to the difference of the two manufactories; barilla, yielded fifty eight per cent. of pure soda. the following are the principal points of difference. In France, soap is generally made from soda and olive oil; it is coloured, and that most sought after is called bleu pale. In this country, we generally use the animal oils, and in all but the very fine soaps, our manufacturers are in the habit of using a considerable proportion of rosin; the most saleable of this kind of soap is of a bright yellow colour. In France, the soap is marbled, by adding to it, while in a mass, a solution of green vitriol, sulphate of iron. Now it appears from the statement of M. Laurens, who is practically acquainted with the subject, that in order phuretted hydrogen, or rather of the alkaline hyanswer the purpose,) is indispensable. In this process, the sulphuretted hydrogen, when united with the iron and oil, imparts a greenish blue colour, which does not combine with the soap, but is dispersed through it, during ebullition, in small masses, so as to produce the marbled appearance. M. Laurens remarks, that the more scientific manufacturers at Marseilles, are in the habit of adding sulphuretted hydrogen, after treating the soap with the green vitriol, should it not be found to a ready and natural solution of the fact, that artinumber of experiments with different substances, for the purpose of devising a cheap method of getting rid of the sulphur, combined with artificial soda, so inconvenient to our soap makers, but without arriving at any very satisfactory results. Some advantage may be obtained if the ley be introduced into open vats, into which the clippings of tin plate, or iron have been thrown, and left standing exposed to the air for several days, and occasionally agitated.

Economy of materials is the basis of successful manufacturing, and, as the intrinsic value of the crude sodas depends entirely upon the quantity of pure alkali they contain, the manufacturer should be able to form a correct judgment in this respect. For this, however, our dealers and manufacturers have a very inadequate standard-they depend almost exclusively on the senses, and the history of the article. The appearance, taste, and weight are their chief guides; after a long experience, and having paid dearly for that experience, no doubt they can form some general idea of the value of the article; but after all, their judgment, thus formed, must be loose. They generally break a piece of the barilla, and apply the tongue to the fracture; if the soda be in a caustic state, even though in small quantity, it will excite a much stronger sensation of taste than when it exists in larger quantity, in the form of a carbonate. Nor is the history of the article more to be relied on, as there are several different qualities brought some instances in which the most experienced soap manufacturers, and even large manufacture of acres suitable for the cultivation of coffee, and ployed in the soap manufactories of Marseilles, and ing chemists, have been most egregiously deceiv- 8,000,000 for the growth of the sugar cane.

that these inconveniences are not complained of ed, by judging of the article in this loose v

should follow,

Fur filum. This is the long round kind, sometimes called calgut. It consists of a simple frond from twenty to thirty feet long, without branches. It affords considerable quantities of kelp.

FIRE BLIGHT.

This disorder is extending itself in this vicinity, to such a degree as to threaten the destruction of all our pear trees, unless some mode shall be discovered to arrest its progress. We are satisfied to impart to the soap the precise tint, so much that the true cause of the disease has not yet been sought after, the bleu pale, the presence of the sul- discovered. Dr Fiske, Dr Greene, and others, of our best horticulturists, have made the most midrosulphuret, (for both of the alkalies are found to nute examination, and have been unable to discover any trace of the work of an insect. Instances have come under our own observation, where the disorder commenced in spots upon the bark, which became discolored and dead, while it was apparently sound and healthy both above and below. In one instance, these spots were found to extend dewn the body of the tree to the root, while most of the branches remained green and apparently healthy. Cutting off the dying branches has sometimes appeared to cheek the disorder, possess the proper colour. This seems to afford but at other times no such effect has been visible, so that it still remains a matter of doubt whether ficial barilla is used with advantage in the soap it is of any use. Still, as it cannot be injurious, manufactories of France, while in this country it and as the appearance of the tree is improved by is so objectionable. I have had recourse to a the removal, it is safest and best to continue the practice. Quince trees are also extensively affeeted by the same disorder. We hope the attention of our scientific men may be turned to the subject till the cause shall be determined beyond a doubt .- Worcester Spy.

ARKANSAS.

This territory has been the scenes of meetings, where the hostility of individuals has been urged to the destruction of life and private quarrels have been quenched in blood. A late fight between Wharton Rector and Robert Chittenden, Secretary of the government, terminated in the death of the latter, who last fall, had killed Henry W. Conway, delegate in Congress. A recontre occurred betwen Andrew Scott, late Judge of the Superior Court, who in 1824, killed Major Selden, one of his associates, and Gen. Hogan, a member of the General Assembly, when the latter was stabbed and died on the spot. The state of society where blood is shed so freely, must be deplorable. Egis.

CROPS.

The crops of grain in this region have generally been gathered in good order.

The quantity of hay cut and cured this season bas perhaps never been exceeded in any former

The growth of Indian corn has also been very vigorous, and no doubt will yield an abundant crop .- Hunterdon (N. J.) Gazette.

FLORIDA.

In Florida alone there are more than 7,000,000

From Deane's New England Farmer.

HEMP.

This plant is tap-rooted, and therefore does best in a deep and free soil. It is luxuriant, and quick in its growth, and therefore requires a rich, and well prepared soil. The soils which have been found to suit it best, are a rich gravelly leam, or a rich black mould, which is dry and deep. It is an error to think that it needs a wet soil, for it bears drought almost equally with any plant that we cultivate.

Mr. Elliot found by experiment, that it answered very well on a drained swamp. He tells of a man in the Jerseys, who raised as much hemp, yearly, on half an acre of such land, as brought him fifty pounds, York money. It is not uncommon for one acre to yield half a ton, which will sell for twenty pounds in cash, at the lowest. I flax; and that, oftentimes, the brake will do all that is necessary in cleaning it.

To prepare land for a crop of hemp, the land should be ploughed as early as August or Septem. this method is practised in England. that the sward may be perfectly rotten. And if it were ploughed in ridges it would be the better, and fit for sowing the earlier. And by cross ploughing and harrowing in the spring, it should be made extremely fine and mellow. A little dung should be applied, if the land be not in the best heart; and the fall is the best time to apply it. But if composts are used, they should be laid on just before sowing.

The time of sowing the seed is as early in the spring as the soil can be got into good order, as it is a plant that is not easily injured by frost; but the middle of May will not be too late.

The seed for sowing should be of the last year's growth, as older seed is not wont to come up at all. I once sowed seed which was brought from England. It looked as well as any I ever sawbut not one in ten thousand ever sprouted. The the drill method, will be enough. If the land be poor, a smaller quantity of seed will serve. The ground should be watched after sowing, that birds do not take away the seeds.

The drill method is en some accounts preferahle to the other. For though in the first crop it will fall short, it exhansts the land less; and therefore, in a long run, it may be mere profitable. But in this way it produces mere seed, and this method is certainly advantageous on account of the more convenient pulling of the hemp. If sown water, or in lie, and washing it. on narrow ridges, or beds, and the trenches shothe broad-cast way would have the preference.-But of this I have had no experience.

As the correspondent parts of generation are on different plants, they are of two distinct sexes, snale and female, and require different treatment. while value. Persons need not fear their crops I will venture to assert, (contrary to M. Mercan- will lie upon their hands, when they consider the dier) that the male is the plant which bears the vast sums of money which are yearly sent to other flowers, and the female that which bears the fruit, countries for this article, almost enough to deprive or seed.

ling, not to hart those plants which are left, they is an antidote to all sorts of devouring insects. Neiwill thrive the better after it, as they will have ther is the plant difficult as to climate. Though more room, and as the earth will be stirred about the hottest climates do not suit it, temperate and their roots. And the drill method is favorable to cool ones do-and it has been found, by the small this work, as the pullers need not tread among the thickest of the hemp. Sowing beds has the same advantage.

After pulling, it must be put into the water without delay, to steep. Ponds and still waters are best. It will not take more than four or five days to water it enough. But it must be watched, lest it should be overdone. After watering, it must be spread and dried in the sun.

The fruitful kind does not ripen till about five or six weeks later. Its ripeness is known by the seed's turning brown. After it is well dried, and the seed taken off by a kind of coarse comb-it must be watered. It will take almost three times am told by one who is much acquainted with it, as much watering as the first kind. The one kind ropes. But the latest kind may be made pliable ployed for fifteen days continually. and fine, if labor enough he hestowed upon it .should be ploughed to a good depth in the fall of Instead of steeping, spreading hemp in the dew the year preceding. If it be green-sward land, it will answer, as I have found by experience; and

The dressing of hemp may be performed in the the same manner as that of flax, if it be not uncommonly large and long. A person who is well cut it in the middle. It was then as long as ordinary hemp, and as strong for every purpose.

If some of the stalks of hemp should be too put by themselves to be peeled by hand. The doing of it may be an amusement for children and invalids.

But to facilitate the dressing of hemp, mills should be erected for doing it. Or the machinery may be an appendage to some other mill. Two brakes should be moved together, a coarser and a quantity of seed for an acre, in the broad-cast finer, placed head to head, that the handfuls may way, is three bushels; but half that quantity, in be easily shifted from one to the other. It is light work for two boys to tend them. But the breaking of large hemp by hand, is severe labor for the strongest men.

If no convenient stream be at hand, a mill may be constructed to be worked by a horse.

It was formerly the custom to beat hemp abundantly with mallets, or with pestles in large mortars, or in fulling mills, to make it soft and fit for may be more easily done, by steeping it in warm

The great profit on a crop of hemp, and its beveled out after sowing and harrowing, I suspect ing an article that will readily command cash, should recommend the culture of it to all our farmers. Besides the hemp itself, of the value of generally found sufficiently rotted. twenty pounds per acre, after it is dressed, the seed of an acre must be allowed to be of considerthe country of a medium, and how naturally the That which bears the flowers, will be fit for demand for it will increase as it becomes more pulling about the end of July. Its ripeness is plenty. There is no reason to doubt of success in at the root, by the falling of the flowers, and the pared-for it is liable to no distemper-cattle will novelties offered for sale in Paris.

withering of the leaves. If care be taken in pul- not destroy it, unless it be with their feet, and it trials that have been made, to thrive well in the various parts of New England. The most northern parts are very suitable for the growing of hemp. The seuthern are equally so.

A new method of rotting hemp was communicated by M. Bralle, and published in a foreign Journal, and is in substance as follows: To twenty-five gallons of water boiling hot, add twelve ounces of green soap-and when the soap is dissolved, twenty-two pounds of hemp are to be immersed, so as to be entirely covered with the liquor, the vessel closed, the fire put out, and the hemp left to macerate for two hours. Several steepings may be made in succession, care being taken to add soap, each time, to replace what has that it is more easily broken and swingled than is more fit to be manufactured into thread and been absorbed, and to heat the water to the formcloth, the other more fit for rigging of ships, and er temperature. The same water may be em-

When the bundles of hemp are taken out, they are covered with straw, that they may cool gradually, without losing their humidity. Next day they are to be spread on a floor, the hands shifted, and a heavy roller passed over them-after which the hemp separates easily from the reed by beating. The hemp thus separated, is spread on acquainted with the culture and manufacture of the grass, and turned, and after five days removed hemp, assured me, that when his neighbor raised to the ware house. In steeping the hemp, the it on a drained swamp, he had it twelve feet long; bundles should be kept in a vertical position, as and that he might manage it easily in dressing, he the operation is found to succeed better so than when they are horizontal.

The advantages of this method are, First, The superior speed of the process to that in common large and stubborn for the brake, they may be use; Second, Its being practicable at all seasons; Third, Its not being injurious to health, or producing any bad sniell; Fourth, A saving of expense, when a proper apparatus is used; Fifth, A superior quality of the hemp so prepared, and less waste, so that nearly a fourth more hemp is obtained from the same raw materials; Sixth, The extending the culture of hemp to all situations, which can now be carried on only in the vicinity of running water.

A very good apparatus, for the process, is formed by a boiler, with covers for steeping vessels.

A process similar to the above described, would probably, save the trouble and expense of waterrotting flax. Lie made of wood ashes, would perhaps, answer the purpose of water impregnated

The Farmer's Assistant states that in the bog spinuing. But Mr. Mercandier has shewn how it meadows in Orange county, N. Y. the hemp is cut close to the ground with an instrument made for the purpose. That when dried it is gathered in bundles, bound with straw and stacked in the field till about Christmas. It is then spread on the snow, and when the snow dissolves in March, it is

For further directions relative to the culture of hemp, see a letter from Hon. Justin Ely, published in the Mass. Agri. Repository, Vol. iii. p. 105.

PLUMS.

I have thought that some remarks, additional to those which I made in your paper of last week, on this fine fruit, might have the effect of inducing those gentlemen practically acquainted with the subject, to give the public the details of their successful practice. My information is, for the most part, theoretical, though founded, in some degree, on observation. If, therefore, not entirely useless, it is much inferior to what they can communicate.

The mode pursued by your correspondent (H.B.) of burying the freit that is punctured and falls cannot be so efficacious as paving; for, in many instances, the inhumation, so far from being fatal, would only assist the insect's natural propensity to hide itself in the ground.

The plum tree is said to flourish in almost any soil where other fruit trees will grow. I have hardly ever seen a young and uninjured tree of that sort, whether in town or in the country, that was not healthy looking and vigorous, although its fruit might never come to perfection. There is nothing in our climate or soil, therefore, to prevent its thriving; and all that remains for us, is to devise some means of protecting its fruit.

If I were making a collection of apricot, plum, and nectarine trees, whether in the country or in town, I should plant them near the house, for greater security; and if possible, in the yard, that I might have a brick pavement under and around them. I should also place them much nearer together than trees stand in such an orchard; that is, ten or twelve feet, or even in some cases, six or eight feet; and, although I should endeavor to prevent them from growing very large, I would permit them to form tall stems. In such an arrangement, there would be several advantages. You might have a greater number and variety of trees in a smaller space-there would not be reguired so much paying-they would be more easily superintended, and would shelter each other from the excessive heat of the sou. And the fruit would not be so exposed to being pilfered.

Another method which I have begun to carry into effect, is to cultivate these sorts of fruit on trellises; or, as they are usually called, espatiers, standing in the open field or garden, where they can be watched, and facing to the south. It is not of much importance however, how they front, for the open trellis-work admits the air and light to penetrate and pass in every direction, and the sun shines upon it from all its aspects. In this particular, the simple espalier is preferable to the wall, which in our climate, is generally too hot and close. These espaliers may be arranged in by private conveyance, or post paid, directed to rows of any length, one behind the other, twenty or twenty-five feet apart; and the interval may be devoted to the raising of various vegetables. If any of your correspondents should desire it, I will hereafter give you the details of construction accompanied by a drawing. The espalier need not be confined to the fruits specified above; but will no doubt answer very well, in some places, for the peach, the pear, and even the fig. For way of cultivating grapes for the table.

The principal advantages of this mode are these: that it occupies less room-that you may pave along under the trees at less expense—that, as which are regularly fed every morning upon ment to deceive them; but on the contrary are

This protection might be afforded by with their artificial mother to a grass-plat, in fine planting the trellis within the afternoon shade of weather; and the mother is kept warm by placa wood or a line of buildings; and, in some degree also, by giving it a proper front.

If these observations should be useful to any person who is anxious to be informed, I shall be much gratified. AN AMATEUR.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 8, 1828.

ALMANACK FOR 1829.

The public are informed that the New England New England Farmer, is in press, and will speediextensive circulation of this Calendar for the current year have induced the Author and Proprietor to commence the requisite preparation for an enlarged and improved impression, calculated for the year 1829. Communications of useful and in- ble or market; and Mrs D. conceives that her teresting articles for this popular and widely circulating Diary, are respectfully solicited and will be gratefully acknowledged. They may be sent the Editor of the New England Farmer, or Bowles & Dearborn, Washington street, Boston.

POULTRY.

The following easy and economical method of rearing poultry has been communicated to the London Society for the Encouragement of Arts, &c. by Mrs D'Oyley, of Sion-hill, near Northallerton, who received the Society's silver medal for the vine they are commonly used, and are the best the same. Where poultry are reared expressly for the market, this method is certainly deserving fit on the produce of the flocks. From the adopof attention.

Mrs D'Oyley keeps a large stock of poultry, they are never suffered to grow higher than steamed potatos, chopped small, and at noon upon interested in taking care of the flock. How far

five or six feet, or seven or eight at the utmost, barley. In the poultry-yard is a small building.

four inches in height, and by a board at the back For the culture and training of fruit trees on two inches high. The roof and back are lined holes; they have no bottom, but have a flannel In selecting a site for an espalier orchard, a sit- curtain in front and at the ends for the chickens

When a week old, they are carried together ing a long narrow tin vessel at the back, filled with hot water, which will retain its heat for three or four hours at a time; and, towards evening, they are removed back again to the bot wall. When three weeks old, they are put into a small room appropriated to that purpose, which is fitted up with frames similar to the artificial mother, placed round the floor, and with perches conveniently arranged for them to roost upon.

When Mrs D'Oyley first attempted to rear poultry in this way she lost several, owing to the roof of the mother not being sufficiently ventilated; Farmers' Almanack for the year of our Lord 1829, and experienced many losses from improper food, By Thomas Green Fessenden, Editor of the until she thought of getting coarse barley-meal, and steaming it until it hecame soft; with which, ly be published. The favourable reception and and with minced potatos, they are fed alternately, and are frequently excited to eat by pellets of dough that are thrown to them.

Upon this food the young chickens are stated to grow surprisingly, and soon become fit for the tamethod might be pursued near populous towns with immense profit. A young person, it is stated, of twelve or fourteen years old, might bring nn some thousands in a season; for hens may be set four times in the year, and be made to rear two broods at each setting. The proper heat of the wall is 80 degrees of Fahrenheit's thermometer; and the troughs for the food are placed without side the cages, from which to the artificial mother, a small quantity should be littered, in order to point to the trough.

Agricultural Memoranda .- In Saxony, the shepherds have no fixed wages, but are allowed a protion of this arrangement, the sheep owners derive great advantage, as the shepherds have no inducethis practice is feasible in our country, it would be rash to assert; it is, however, worthy of investigation and perhaps of trial.

The juice of carrots, added to cream, in winter, will give the butter made therefrom, the flavor and appearance of that made in summer. [Feeding the cows with carrots is better].

. A table spoonful of unslacked lime, given to horses, regularly with their water or food, for three or four days, (night and morning) will completely expel the bots.

Water, in which potatos have been boiled, will protect cabbages, turnips, and vines, from the ravages of thes and bugs.

It is a safe maxim, that grain should never be sown but when the ground is laid down to grass, or ploughed from it.

It is remarked by Sir John Sinclair, that neither wheat or rye straw should be given to mules, as it disagrees with them, and will render them unfit for labor.

To insure a good supply of manure for the ensuing year, profit of every favorable opportunity to draw bog and swamp earth into the barn yard.

INOCULATION OF FRUIT TREES.

The best season for inoculating or budding fruit trees extends from the middle of July to the end of August, and includes all those days when the bark can be separated from the tree without injury to the buds. The praises often bestowed on ry to the buds. The praises often bestowed on this operation as a means of changing the kinds and introducing new varieties of fruits into the careful are often too general to be correct and introducing new varieties of some content of the manufacture of the basiness, habits of the careful are often too general to be correct. orchard, are often too general to be correct .-Grafting has been found much preferable on the pear, apple, and all stocks which will bear the application of the saw and knife. The scion once set, and any man can insert a graft with success, it grows rapidly and vigorously; requires no other care than pruning the shoots which might drink too deeply of the juices perhaps once during the season,-and having passed the first year rises the pelting of the storm and the tossing of winds. The bud demands constant care, to loosen the bandages, to thin and lop away the branches above its insertion, and after much pains bestowed is liable to numerous accordance. ed is liable to numerous accidents,-a careless finger may touch it too rudely-an insect may gnaw away its head, -a blast of wind may scparate its connection, and if it escape all these perils, it will be less firm than the graft. For the peach, plum and other trees from which gum exudes on being wounded, and for bushes and plants too slender to admit of the insertion of grafts, butding may be applied with advantage, and indeed is the only method which can be used to obtain etching historical and other prints. the desired varieties of fruits. The Rose, well deserving the rank assigned to it in poetry, as the compress of flowers, having in its almost countless varieties a whole republic of queens, may easily he changed by this process, so that the same bush may be covered with blossoms of all possible tints and every form of beauty, and a single garden pot exhibit all the colors of the rainbow, and all the combination of leaves which wide shrubberies can exhibit. 'The wild briars which spring spontaneously by the way sides form hardy and vigorous stocks for the insertion of the more delicate of the cultivated species of roses, and the experiments for ornamenting their stems with chaplets of fair blossoms may furnish the reader with amusement if it lead to no more useful result .- Nat. Egis.

Plums, Peaches, &c. how kept fresh through the year .- Beat well up together equal quantities of honey and spring water; pour the mixture into an earthen vessel; put in the fruits all freshly gathered, and cover them quite close. When any of the fruit is taken out, wash it in cold water, and it is fit for immediate use.

The fumes of brimstone are useful in removing spots or stains in linen, &c.: thus, if a red rose be held in the fumes of a brimstone match, the colour will soon begin to change, and, at length, the flower will become white. By the same process, fruit stains or iron moulds may be removed from linen or cotton cloths, if the spots be previously moistened with water.

Negotiations have been once more commenced between His Majesty's Ministers and the Government of the United States, for reopening the commerce between the British West India Islands and the ports of the Union. Montreal Courant.

The editor of the Milledgeville Recorder states, "that the district of country round Milledgeville, including a territory of forty miles square, is indebted to the banks to the amount of two millions of dollars."

MISCELLANIES.

THE SWEET BRIER .- BY BRAINERD Our sweet autumnal western-scented wind Robs of its odors none so sweet a flower, In all the blooming waste it left behind, As that the sweet brier yields it; and the shower Wets not a rose that bads in beauty's hower One half so lovely-yet it grows along The poor girl's path-way-by the poor man's door. Such are the simple folks it dwells among; And humble as the bud, so humble be the song.

I love it, for it takes its untouch'd stand Not in the vase that sculptors decorate-Its sweetness all is of my native land, And e'en its fragrant leaf has not its mate Among the perfumes which the rich and great Buy from the odors of the spicy East. You love your flowers and plants-and will you hate The little four leav'd rose that I love best. That freshest will awake, and sweetest go to rest?

LINES

From the Saco Palladium.

Give me a snug little farm, with sefficient learning to understand my bible-a little wife that can milk the cow, and rock the cradle-that can sleep at night, and work all day-that can dis. course music on the cheerful spinning wheel, and hang your Greek and Letin. The present times are too unnatural and Juxurious.

Our ancestors liv'd on bread and broth, And woo'd their healthy wives in home-spua cloth; Our mothers nartur'd to the nodding reel, Gave all their daughters lessons on the wheel, Though spinning did not much reduce the waist, It made the food much sweeter to the taste : They plied with honest zeal the mop and broom, And drove the shuttle thto' the noisy loom. They never once complain'd as we do now, We have no girl to cook, or milk the cow. Each mother taught her red cheek'd son and daughter To bake, and brew, and draw a pail of water. No damsel shuon'd the wash-tub, broom, or pail, To keep usullied a long grown finger pail. They sought no gaudy dress, no wasp-like form, But ate to live, and work'd to keep them warm. No idle youth, no tight-lac'd mineing fair, Became a living corpse for want of air. No fidgets, faintings, fits, or frightful blues-No painful corns from wearing Chinese shoes.

March of intellect .- A gentleman on visiting the school of Mr. Wood, in Edinburgh, had a book put into his hand for the purpose of examining a class. The word "inheritance" occuring in the verse, the querist interrogated the youngster as follows:

Ques .- What is inheritance?

Ans .- Patrimony.

Ques .- What is patrimony?

Ans .- Something left by a father.

Ques .- What would you call it if left by a mother?

Ans .- Matrimony.

The Dutchman's shower .- Our steady rain has been interrupted by two or three days of good weather, and pleasantly cool. We have found a good description of the previous month, in the Dutchman's weather journal, "had a dunder shower for tree weeks, and then it set in for a settled rain."

Messrs. F. & J. Andrews of Lancaster, propose to publish an Edition of Mrs. Rowlandson's Narrative of her captivity and sufferings among the Indians, by whom that town was destroyed in 1676.

RATTLESNAKES.

The present season has discovered an unusual the tooth into the wound.

The latter hypothesis we believe is most correct. The upper jaw of the rattlesnake is provid- pollen to the female plant. ed on each side with one, two and three fangs, bite, he coils himself up with his head drawn back, but with his rattle, warns you of his presence .of biting-it is done entirely by the spring of the

caught a rattlesnake, and with a forked stick fas- dies. It is the Udora canadensis of Nuttall, and tened him to the ground, while with a knife he may be found in the months of July and August extracted the fangs, after which the snake bit a in most of the tributary streams of our rivers, -N. person with his masticators, without injury resulting from it. We examined two of the fangs of this snake, and the cylinder in them was distinctly visible to the naked eve, and in order to be more certain we inserted a horse hair with case through it, their eavity passing through the tooth from its root, and coming out close by the point. It has been repeatedly said, and correctly too, that there is no part, however minute, of the animal creation, which nature has not adapted to some useful purpose. What then are those cavities in the fangs used for, which are so entirely different from the ordinary operations of nature? They are clearly intended for the transmission of the poison to the wound inflicted .- Miner's Journal.

Gigantic hemp .- There is now growing on the property of Stephen Girard, in Passyunk township, Philadelphia county, a stalk of hemp, (amongst others) nine feet four inches high, and has not yet attained its ultimate height. The stalk is four inches and a half in circumference, just above the surface of the ground.

Cure for the fever and ague .- Take a gill of very strong eoffee, mixed with an equal quantity of limo juice-the dose to be taken just before the fit of ague is expected. Dr. Ponqueville's "Travels in the Morea," contains the following: I have often seen intermitting fevers subdued entirely by a mixture of coffee and lemon juice, which is the general remedy for them, all over the country. The proportions are three quarters of an ounce of coffee, ground very fine—two ounces of lemon juice, and three of water. The mixture to be drank warm, and fasting .- Charleston Mer.

Lowell .- Above 125,000 yards of cotton cloth, and about 3000 yards of cassimere, are manufactured weekly, in Lowell.

It is stated, that Mrs Hemans, so long distinguished as the first poetess of the age, is about to make Edinburgh her place of residence.

SEXUALITY OF PLANTS.

This remarkable structure of plants exemplifies number of these venomous reptiles; several per the same indispensable process in the vegetable sons have been bitten, and some lives lost. The as in the animal kingdom. One of the most sinopinion of naturalists and others as to the manner gular plants which exhibits this structure in a in which this snake inflicts the wound, or rather very striking manner, is the Valisneria spiralis, a when inflicted, ejects the poison into it, does not species which is common to Europe as well as to appear to be settled. Some suppose that the pois- this country. It is an aquatic, growing on the on is thrown into the wound from a bag seated at margin of rivers, and bearing its fertile or female the root of its tongue, and located there by nature flowers on a very long spiral foot-stalk, so that for its reception. Others believe that the poison whatever depth the tide may cause in the waters, is contained in the upper jaw, and when the bite it always floats; the male flower, on the contrary, is inflicted it is injected through a small orifice in is attached to the stem, and is submersed until it is ready to blow, when it detaches itself from the stem under water, rises to the top, and carries its

They are situated in the jaw, with also an aquatic, very small, and much resembling their points inward. When the snake prepares to a species of moss. The whole plant is immersed in fresh water streams. The female flower is athe maintains his ground with resolute firmness, tached to a spiral stem so slender as scarcely to exceed the finest hair in diameter; the male is The lower jaw performs no part in the operation horne on the stem under water, and migrates at its maturity to the surface, sheds its polien, which floats around the female plant until the office of A few days since a gentleman of this town fractification is performed, when it withers and Y. Farmer.

RASPBERRY WINE.

Take equal quantities of fruit and water, bruise and let them stand two days, then strain it, and to every gallon put four pounds of coarse sugar, when dissolved, put the liquor in a barrel, and when fine, which will be generally in three months, bottle it, and in each bottle put a large spoonful of brandy .-- Ib.

COFFEE.

It was owing in some measure to a distinguished French botanist, that we are so abundantly furnished with the coffee berry. Two plants were, under his care, taken to the West Indies, from the botanic gardens at Paris, but on the voyage the supply of water became nearly exhausted; this person was so anxious to preserve the plants that he deprived himself of his allowance in order to. water the coffee-plants. From these two, all the coffee grown in the West Indies has sprung .-Formerly, coffee could only be got at a great expense from Mocha in Arabia.

Turnip Seed, &c.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, Boston, an extensive assortment of Turnip Scode, some of which are the growth of the present season—the finest sorts either for family use or stock. The most improved sorts for the former are the White Stone, White Dutch, Yellow Stone, Yellow Malta. The Yellow Stone is one of uncommon excellence and keeps well. Of the sorts for field culture, the White Norfolk, White Globe, and Yellow Aberdeen is most approved among the farmers of England and Scotland, as it erway to a large size, is very sweet and untritious, and keeps. most approved among the farmers of England and Scotland, as igrows to a large size, is very sweet and nutritious, and keeps till June. Also, Yellow Ruta Baga, or Russian Turuip, of the best description. The above seeds were saved in Europe expressly for us, and the utmost dependence may be placed upon their geomie quality. A variety of Long and Turnip Radishes, suitable for growing the three ensuing months. Prickly or Pall Spinach, Long Prickly and Early Cluster Oucumber; also the genine Girkin Cucumber, or West India pickling one of the finest pickles.

Likewise 200 lbs, fresh common white flat English Turnip Seed, a part of it the growing of 1208.—10 celears and purpose.

Seed, a part of it the growth of 1828 :—to dealers and purchasers by the quantity, it will be put at a low rate.

Published every Friday, at \$3 per annum, payable at the end of the year sout those who pay within sixty days from the time of subcribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by John B. Russell, at No. 52 North Market Street, (over the Agricultural Warchouse). - Thomas G. Fessenden, Editor.

VOL. VII.

BOSTON, FRIDAY, AUGUST 15, 1828.

No. 1.

AGRICULTURE.

TARRING FRUIT TREES.

Ma. Fessengen, -Our town has for several years been infested with the Canker Worm; the orchards, in some sections, having been completely ruined by them. Every expedient has been resorted to for the preservation of the trees, but none have been successful except tarring; and this, when properly applied and attended to, has proved entirely efficacious .- I have about 250 apple-trees, from twenty to thirty years old, and the last season I made use of between one and two barrels of tar, and a man would, after becoming a little more used to the business, apply a sufficient quantity to every tree in less than two hours, including the time taken in heating the tar, which should be rather more than blood warm. This, to be sure, is attended with some expense, but after all it is trifling, when compared with the loss of your fruit; or even the desolate appearance of your orchards, and the annoyance of the creeping millions, when the trees will no longer afford them sustenance, covering your fences and buildings, and, like the flies of Egypt, "corrupting the whole land."

The method adopted by me is as follows:-I took the common sheathing paper and cut it into strips about four or six inches in width; these strips I dipped into tar which had boiled long enough to be pretty stiff when cold, and as soon as they could be conveniently handled, placed them round the trees, by tacking them with pump nails where necessary, and at a proper distance from the ground for the easy application of the future dressings. After having prepared the trees as above, you may rest perfectly easy until there is a frost sufficient to chill the surface of the ground. I know not what particular agency the frost has in the business, but such I believe is the fact, that none of the insects move from their fragile habitations, until they are awakened to a sense of their situation by a slight touch of the icy finger of Winter. But after a frost, as above pass, until your trees have been secured by a dressing of tar on the paper, and where the paper does not adhere from the unevenness of the tree, grass may be put in to fill up the space, and a little tar upon it will stop any from going through it. The tarring must be continued every afternoon, (the later the better, as the insects do not move much till about sunset,) until sometime in the following May, unless the ground should be entirely closed with frost, or covered with snow

Particular care should be taken in this respect for the insects will continue to go up all winter whenever the top of the ground is sufficiently thawed to admit of it. Nothing need be feared from the miller, or other winged insect, this being the male-the females having no wings to assis them in their ascent, the tar will be sure to arrest them, if properly and daily applied.

The trees do not suffer by the above process, the tar being confined to the paper, which may b taken off the 1st of June, leaving the bark per fectly bright and free from stain.

affording here and there a green spot for the eye included,) of about to acres. Much taste and reguto rest upon, when all around wore the appear-; larity is discoverable in the arrangement, and the ance of worse than wintry desolation; in other intelligent proprietor has spared neither pains or instances, orchards have been reclaimed, after have expense in collecting from every quarter of the ing been for several years stripped of their foliage globe every tree, fruit, and plant, which might and laid entirely waste; but in the latter case, subserve for the use of man, or for ornament. At much more time and care is required than if taken the time I was there, his collection of roses were on their first appearance.

Lynn, Aug. 5, 1828.

EMPLOYMEMNT OF TIME.

Mr. Fessenden,-Your repeated favors induce repeated demands upon your goodness. I should like to add to your hints, inserted in your last upon the improvement of the winter evenings of farmers. If farmers benefit themselves by weekly, social meetings, they may confer a still greater benefit upon their sons and their daughters. If a subject upon agriculture or domestic economy, say the raising, use, and preservation of fruit-the management of a garden, or some particular vegetable, of a dairy, of poultry, or of fuel, should he prepared at one meeting for consideration at the next, it would naturally, and almost necessarily, become the topic of conversation at the table anfireside; both before and after the regular discussion. Conversation upon a particular and im; ortaut subject would create a desire for reading, and this desire would lead to the possession of books, and periodical and weekly journals, which treated upon it. The natural consequence would be, that conversation and social intercourse, the channels of almost all the information and habits, both good and bad, which exist in the world would be purified and elevated. Topics of conversation would be immediately changed. Substantial improvements upon farms, domestic economy and convenience, the principles of science which ought to direct, in the construction and uses of farming utensils, the laws of heat, upon which the economy and success of the management of fuel depend; and consequently natural philosophy, chemistry, general science upon matter, intellects and mentioned, a single night must not be suffered to morals, would, in conversation, take the place of a fashionable dress, or novels, the shape of a leghorn, the color, form or position of a bow most fashionable upon headdresses, and what is still lower, of petty scandal. And consequently good however, of their vigorous growth, I will mention would be done and evil prevented.

FRANKLIN.

NURSERIES AND GARDENS ON LONG ISLAND.

If Mr. Fessenden thinks the following memoranda, made on a late tour to the city of New York, worth the space they will occupy in a corner of the New England Farmer, he will oblige a subscriber by inserting them. I conceive it a just tribute to the Long Island nurserymen; though we shall soon show them something of the kind woth seeing in the vicinity of Boston.

VIATOR. Yours, &c.

Newton, Aug. 12, 1828.

At Flushing we visited the Linnæan Botanic Garden, the establishment of WILLIAM PRINCE, Esq. This is probably the most extensive collec-In this way or chards have been preserved from tion of exotic and indigenous productions in the the Isabella, fifty bunches. It will be observed

the Canker Worm in the midst of their ravages, state of N.Y. and covers an extent, (buildings, &c. in bloom; these cover the extent of an acre, and consist of more than 600 different kinds.

Opposite to Mr. Prince's is the establishment of Mr. MILLS. This consists of 8 acres, closely filled, and contains an extensive collection of fruit trees and ornamental productions.

In the immediate vicinity of these nurseries is the establishment of Messrs. Broongood & Co. of deservedly high reputation. Here, too, may be seen a very extensive collection of fine fruit and ornamental trees, shrubs, &c.

At Brooklyn we called at the celebrated Horticultural Garden of Mr. ANDRE PARMENTIER This is a recent establishment begun in 1825. It cont has 20 acres and is surrounded by a wall of masonry, after the manner which we are told is practised on the old continent; a partonly of this is, as yet, brought into a state of cultivation; it already contains, however, a valuable collection of fruit and ornamental trees, green-house plants, &c. and especially of grape vines which he has increased by extensive importations. This garden, so far as completed, has been laid out by the very intelligue proprietor in the most modern style and with great taste; for in the branch of ornamental and picturesque gardening, Mr. Parmentier, it is believed, greatly excels. On an emi-nence, in a corner of the garden, he has constructed a small, cheap edifice denominated & · Rustic," from the top of which you have a comnanding view of the surrounding country.

VINES

Extract of a letter to the Editor of the New England Forme , dated Bridgeport, Con. August 5, 1828.

I had it in contemplation to give you a statement of some vines, of different varieties, which were planted in the fall of 1826, but have thought better to omit a mere full account until I have given them a fair trial. To give you some idea. the length to which some of the shoots of the present season have attained; I measured them, on Saturday, 3d of August, and found the longest branch of the early white grape to be 15 feet, shortest 10 feet-6 branches in all, average 1€ feet each, making the whole length of all to be

195 feet.							

The abovementioned vines are all in fruit, centaining from two to fourteen bunches each, and that this is the second season of growth since I repromises good success.

its ever having been tried.

I inserted a couple of grafts of the Isabella length of a foot, or little more, a week. J. B.

Our correspondent will accept our thanks for of an Isabella vine, one hundred and twenty bunches. This year on the first and second years' each extending twelve feet from the trunk.

FOR THE NEW ENGLAND FARMER.

THE MASSACHUSETTS PROFESSORSHIP OF NATURAL HISTORY, AND THE BOTANICAL GARDEN AT CAMBRIDGE.

The Visiters of this Professorship, and public garden, feel it to be their duty to lay before the public, its actual situation, and its imperious wants, While its critical circumstances impose this obligation on the persons intrusted with its care, and management, they are sensible, that it is their duty to lay before the public, the history of their administration of its funds, in order that those who have contributed to it, and those who may be solicited to afford their aid to prevent its decline, and possibly ruin, may be enabled to judge how far the trust committed to the Board of Visiters has been faithfully executed. The subscription was commenced in 1801, and completed in the spring of 1804. There was a general and we may say an universal feeling in this state, that the natural history of the United States had been much to our disgrace, entirely neglected. There were, at the time when this subscription was opened, but two persons in New England, who could give a scientific description of any tree, shrub or plant, in this portion of our country. The other branches of natural history, Zoology, Entomology and Mineralogy, were in a state still more miserable. Yet at that moment, the remotest parts of Germany and Sweden were familiar with our plants, and when our early botanists began their studies, they were obliged to resort to the works of these distant authors written in a foreign or a dead language, in order to know with any accuracy the plants which sprung up under their feet. It was not, however, a sense of national inferiority alone which stimulated the exertions of the founders of the Botanic Garden at Cambridge. A personal experience of the embarrassments, which attended both useful and ornamental horticulture in the very limited state of knowledge which then existed, had its share in producing the exertion. Our fruits and ornamental plants were known by such an endless variety of names, that no man could feel the least security, when he ordered a tree or a plant, that he should not receive one, which he the erection of the buildings and laying out the had before possessed in great abundance.

ceived them; the fruit all looks well, and I think botanical garden. That it was so successful in of 13,000 dollars, besides a note of seven thousand the then existing circumstances of the town of dollars taken for a township of land granted by I have seen it recommended to graft some fine Boston, and of the state is as surprising as it is varieties of the grape on our native stock of vigo- honorable to the contributors. Boston did not at of the promiser became of no value, and the Board rous growth, but have never seen an account of that time contain a population exceeding 35,000 of visiters were glad to receive back the contract souls. Yet a subscription was readily made of for the land, and to cancel the notes. 35,000 dollars. The subscribers, instead of seekgrape the last spring, which succeeded very well; ing an act of incorporation, or of granting the the longest having already attained the length of funds raised, directly to the College, chose to vest 9 feet, and the shortest, 5; they now grow to the the visitorial power, and the entire management honor and justice to pay to Professor Peck his his statement; as the culture of grapes as a fruit Academy of Arts and Sciences, and the President naturalist of New England, because in their serfor the table is now exciting much attention in of the Massachusetts Medical Society for the time vice by the act of God he became unable to per-New England, articles on this subject are perused being. The motives, which led to this arrange form his duties. with much pleasure. The Messrs Winships, of ment will be readily perceived. The duties of funds still lower. The Garden would long since Brighton, had on the first year's growth of wood, the Corporation of Harvard College were very have followed the fate of the Charleston Publicgreat, and principally devoted to the care and discipline of the University. They might be, and in growth there are three hundred and sixty-four all probability would be, men, not conversant with bunches; two horizontal and one upright branch, Horticulture. The great object of the establishand foreign plants, useful in agriculture, horticulof the sciences of botany and entomology, it was natural and highly expedient, that the care of the medica.

> The funds raised by subscription were about of a township of eastern lands, which from various untoward circumstances has not been available to iters will now proceed to state the manner in which they have disposed of these funds. There was no competent knowledge, existing in this country, as to what were the wants of a Botanic Garden, or as to the mode of putting one in operation. The Board of Visiters themselves decided that it was expedient to send the first Professor to Europe to acquire this knowledge. This voyage cost the Institution 9,000 dollars, and the Library selected by the Professor 1100 dollars more.-This, it will be at once perceived, made a serious encroachment on their funds.

> The land on which the garden is placed, including the gardener's house, cost 1800 dollars, and a better location could not have been made within a reasonable distance from the College. fences cost 1000 dollars. The Green Houses, equal if not superior to any in the state, cost 25,000 dollars, and the Professor's house 4,000 dollars .--The whole of the foregoing sums, to wit,

There was some accumulation of income during grounds, so that when the accounts were closed,

These motives led to the attempt to found a there remained property on interest to the amount the Legislature, which owing to the misfortunes

The fund thus diminished produced only 800 dellars per annum, while the Board of visiters were obliged by law, and by every sentiment of of the funds in the Trustees of the Massachusetts moderate salary of 1200 dollars. No man, it is Society for Promoting Agriculture, with whom presumed, will complain, that the Board of visitthey associated the President of the American ers declined to withhold its support from the first This obligation reduced the Garden, and the New York Garden, founded by Dr Hosack, and purchased by the state, at the price of 35,000 dollars. It would have, like tnem. been converted into a wilderness, had not the Visment, being the promotion of knowledge in native iters applied for, and obtained the aid of the Legislature-of a very enlightened Legislature, who, ture and medicine, as well as the encouragement not mistaking false maxims of economy for true ones, saw in the destruction of a great public work, great public loss, deeming that the riches Institution should be committed to persons among and prosperity of a state are as much promoted. whose duties were the promotion of agriculture, to say nothing of its reputation, by wise and genhorticulture, and the knowledge of the materia erous establishments for the promotion of knowledge, as by any financial measures. The amount received from the Legislature could not in any 35,000 dollars. To this sum was added a grant one year exceed by the resolve itself 600 dollars, and frequently fell short of 500. Even this small sum has not been received during the last three the Institution in any degree. The Board of Vis- years owing to the state of the Treasury. The Botanic Garden founded by private muificence, and one of the most honorable Institutions of the State must fall, unless a small portion of the public spirit exhibited by our predecessors still remains to be called forth in its support. Of this the Visiters can entertain no doubts; doubts, which would be a reproach to our present state of society-to a much more extended, and a much wealthier population. It is now more than 25 years since the last appeal was made on this account to public munificence. Many persons have accumulated fortunes since that time, and others, who then subscribed have increased their means of doing good.

It only remains now to state the wants of the Institution, and the means proposed of relieving them. The fences require an entire renewal.-They have lasted 20 years, which is all that can be expected from wooden materials. They canbe replaced for 1000 dollars. The Garden stands in great need of a stove or hot house for tropical plants. The present house is a green house only, and when it is made sufficiently warm for tropical plants, the plants of cooler countries suffer. This, too, prevents our raising so many plants for sale, as we could wish to do, for the true policy of the establishment is to make it eventually support itself. At present it produces about 400 dollars a year, and on the proposed plan it is confidently hoped it will yield a thousand.

The next and a very pressing want is an ade: quate support, and at least something approaching to a suitable reward to the Curator. No Botanie Garden in the whole world can be found without one man of science at its head. In the impoverished state of our finances, we could offer to Mr NUTTALL only 500 dollars a year. But he had en:

couragement to hope for a better state of things; to him, that promised time, though patiently expected for seven years, has not yet arrived. Mr ilies only. NUTTALL has been for many years under the eye ments have appeared to the Board of Visiters, all that they could wish or expect from a man, who history of these States. He has traversed all the most unhealthy climates of the United States, and to the value of 9 dollars per annum. from them all collected additions to our catalogue of plants. As a writer on subjects of natural history, Mr NUTTALL takes a high rank. All his they are sold for cash. works exhibit a clearness, and a thoroughness of of students, is one of the best in our language .-Can there be a wish to restrict the compensation of this deserving and unassuming man to a miser- many hardy plants fit for private gardens which able pittance of 500 dollars a year? We cannot are always for sale, and persons wishing to pre-planted to improve it. The Asiatics have learnt expect that our Institution will flourish under so parsimonious s system. Some additional labours will be required in the Garden to make it what pride to ourselves.

For these various objects we ask only a subscription amounting to half what our fathers did for it, and for us. From 17 to 20,000 dollars will place the Garden in a state, which will require no further public aid. The Board of Visiters may take some share of praise for having made the Garden what it is, without calling for further subscriptions. The Garden at Cambridge would be deemed a respectable one in Europe. It is not much inferior to that at Edinburgh, or Leyden, and it is superior to an ancient one at Rouen, and many in Italy. In this address to the public we shall not be able to enter into details, but we shall publish in a separate sheet, the past and present state of our collections.

Our proposed mode of placing this garden on a footing with the one at Liverpool, (which is the mark at which we would aim) is,

First, by soliciting subscriptions in aid of the permanent fund. These subscriptions are not expected to be great from each individual, though we hope that the opulent, though often pressed into fessorship of Natural History, there established, the public service, may set an example of liberality.

In soliciting these subscriptions we shall appoint those as solicitors (who we believe feel the impertance of this school for a neglected science) to aid our own efforts.

Our second proposition is suggested by the experience of the Garden at Liverpool. That fine establishment is supported chiefly by the publick taste. The love and admiration of the beauties of nature is taxed, and not taxed in vain. Annual subscriptions are made for the privilege of visiting the Garden, and we should hope that this resource will not be found unavailing here.

It is proposed to have two prices for annual subscriptions, -one of three dollars a year, for which the subscriber shall have a ticket to admit his own family gratis for the year in winter and summer: the second to be five dollars, for which the person subscribing shall receive a ticket of admission on the same terms as those above stated, and shall moreover be entitled to receive plants, or cut flow ers for ornament to the amount of two dollars.

also have tickets of admission for life for their fam-

Subscribers to the amount of 100 dollars shall of the Board of Visiters. To the nation he was have tickets of admission, gratis, during life, and before well known. His conduct and his acquire- shall be entitled to receive plants to the amount of 3 dollars a year

Subscribers to the amount of 200 dollars and has devoted his best days to illustrate the natural upwards, shall have tickets of admission, gratis, during life, and shall have a right to receive plants

The prices of plants shall be fixed by the Curator, and shall be placed as low to subscribers as

It is, however, distinctly to be understood, that knowledge accompanied with simplicity, which there are many plants which from their rareness render them highly valuable in the infant state of or high value cannot be sold, but the classes of this science in our country. His last work, in- plants which are ever sold, the subscribers shall tended as an Introduction to Botany, for the use have an equal right with other purchasers to re-

> It may be proper to observe, that there are cure such plants are earnestly requested to give to the Public Garden the preference.

A taste for botany, and for flowers, as necessawe wish it should be, an honor to Massachusetts; ry as agreeable ornaments, is inseparable from a one of its sources of praise from foreigners, and of state of polished society. It would not be credited, if we were to state the amount paid for flowers in London, Paris, Liverpool, Amsterdam, and all the other great cities of Europe. Our country cannot form an exception. New York and Philadelphia now support great establishments for the cultivation of flowers. It is not to be believed that a similar taste will not prevail among our ladies. We have one advantage over our sister states. We have a public garden, honorable to the state, and to the city, whose inhabitants founded it, and while we gratify our own tastes, and fever. give pleasure to those who visit us, by ornamenting our rooms with the choicest productions of nature, we may feel at the same time, that we are contributing to the advancement of an establishment which will confer honor on this portion of our country.

The Committee to whom was referred the subject of devising means of relieving the present necessities and of promoting the future extension of the Botanical Garden at Cambridge, and the Prosubmit the foregoing address to the public, and plan to the consideration of the Board of Visiters. JOHN LOWELL, Chairman.

At a meeting of the Board of Visiters of the Massachusetts Professorship of Natural History, held at the house of the Hon. RICHARD SULLIVAN, on the 10th day of August, 1828, the above report was accepted, and the subject was committed to John Lowell, Esq. Dr James Jackson, and John C. Gray, Esq. to adopt such measures as they may deem proper to carry the foregoing plan into execution.

Attest. B. GUILD, Secretary.

TREES.

Extract from an Address to an Agricultural Society in Mary-land, by Thomas Low, Esq. President of said Society. Permit me again to urge you to plant locusts chestnuts, cherries, and other useful trees, along your fences. Mr. Say, a much approved author on political economy, says, " In all times, attention to trees is recommended most strongly by

Subscribers to the amount of 50 dollars shall the ablest men.-The historian of Cyrus, puts amongst the number of his titles to glory, his having planted all Asia Minor with trees .- Sully, who had so many valuable economic views, planted trees in almost every province of France. I have seen many of them, to which public veneration attached his name, and they reminded me of Addison's observation, whenever he saw a plantation of trees, when he exclaimed "a useful man has been here."

" Man has only to plant trees once, and nature does all the rest-they become an ornament and enrich the proprietor, and they also add to the salubrity of the air-for the leaves absorb carbonic acid gass, which, when too abundant, is destructive of health, whilst they give out oxygen, which is that part of air the most proper for respiration."

Mr. Say also observes, that trees cause rain. and also benefit the soil by sheltering it frem drying winds. Mr. Say undoubtedly alludes only to the absorption of had air, but trees may be from experience, that trees are either prejudicial or beneficial to health, according to their different exhalations, and to confirm, tell a story of two physicians, who resided at a distance, and wished to ascertain each other's skill. The first chose a stout man, and told him to carry a letter to the other, and to sleep on the road every night, under a tamarind-tree-the purport of the letter was, that the hearer had a complaint, which baffled his skill-the man arrived sick, the physician, by his inquiries, learnt the cause of his disorder, and immediately ordered him to sleep every night under a banyan-tree, and to deliver this reply, "the bearer you will find recovered."-Wholesome trees, in large cities, would perhaps prevent the yellow

SELF-SHARPENING PLOUGH.

An enterprising mechanic has been here during the past week, exhibiting an improved cast Iron Plough, for which a patent has been obtained .-The advantage of this kind of plough is, that the share or point, being separate pieces from the mould iron, which have their upper and under surfaces similar, may be turned whenever one side begins to wear away, so as to wear less fast, and keep constantly sharp. This plough is much used where it has become known, and is approved by tarmers, who have examined it here. The making costs no more than that of the common kind. Saratoga paper.

Domestic silk .- We were not less surprised than pleased (says the Little Falls paper) to find, in a late excursion to the south, that the manufacture of silk is carried on as near as Paine's Hollow, in the town of German Flats. Mr. Philip Swift has cultivated the mulberry tree, and reared silkworms for some year's past. Sixty skeins of fine silk were made last season in his family; and he has now about 1500 or 2000 silk worms busily employed. Let others of our enterprising citizens enter on the business, and it may become as profitable here as in the noted town of Mansfield, Conn. During the war, the raw silk made by a single family it a year, at the latter place, is said to have sold for one thousand dollars.

The breadfruit-tree is about to be introduced into the gardens at Chiswick, by the Lendon Horticultural Soviety.

Extracts from a "Journal of a Horticultural Tour through some parts of Flanders, Holland, and the North of France, by a Deputation of the Caledonian Horticultural Society."

STEAM IN HOT HOUSES.

"For increasing and keeping steady the temperature in several of his hot-houses, Mr. Andrews has of late employed steam, in aid of the ordinary flues conveying smoke and heated air. The steam is carried through the house by means of metal pipes, which are laid along the top of the brick flues. The pipes are of copper, on account of its expanding less than lead. They are of a square form, and are set on edge, so that any condensed vapor trickling to the bottom may occupy but little room, or present only a small surface. As in the common steam engine, the boiler is made to regulate itself by a simple contrivance: It is furnished with a float, which descending in proportion as the water is dissipated in steam, in due time raises a valve and admits a new supply of water .- The superfluous condensed vapor also returns to the boiler, there being no other provision for disposing of it. It is scarcely necessary to add, that by merely opening a valve, the house can at pleasure be steamed, i. e. filled with steam, than which nothing can be more conducive to the health and vigor of plants confined in a hot-house. We were assured that seven bushels of coal would go as far in keeping up the steam-heat, as ten bushels do in maintaining an equal temperature the other way. When the aid of steam is resorted to, the temperature is found to be more easily regulated, continuing equable for a considerable length of time. Mr. Andrews, Junior, mentioned, that the furnace being duly charged, and the boiler prepared, he could with confidence leave the hot-house for eight or even ten hours together, being satisfied that the temperature would confinue to be maintained for that length of time."

MARKET FOR BUTCHERS' MEAT.

"The market for butchers' meat in Ghent is kept extremely neat and clean; no offensive streams of blood arc to be seen, every thing of that sort being confined to the shambles. Each dealer in meat keeps a carpenter's plane, with which he daily shaves the surface of the table of his stall, so that a stranger would be apt to think that all the tables were new."

MANNER OF FORCING RASPBERRIES.

"Raspberries are forced at Haarlem. bushes are planted on the north and south sides of a pit filled with tanner's bark, leaves or stable-litter. The shoots of last year were at this time laid down to a horizontal trellis [structure of wood or iron) where they had yielded fruit in the vernal months. All means of artificial heat were now (29th August) of course removed. shoots of this year were allowed to spring upright; and these will, in their turn, be laid down to the trellis at the approach of winter, when the others will be cut away. The gardener told us that raspberry plants thus treated, yield large crops; and doubtless they are better adapted to this mode of forcing than vines."

ON RAISING NEW VARIETIES OF PRUIT.

"The experience of Mr. Van Mons, (a famous Dutch horticulturist) confirms what has been obproduced by a seedling tree in the first year of says it makes a much stronger fire than the wilbearing, affords by no means a fair criterion of its low. The weeping willow is a singular and val-

ising qualities, a white and heavy pulp, with juice | hest adapted to making baskets, hurdles, tool hanof rather pungent acidity, it may be expected in dles, &c. no husbandman ought to be without a the second, third and subsequent years greatly to permanent stock in full growth. For the more improve in size and flavor; particularly if the buds, general, extensive, and important purposes, the leaves, bark and wood possess the characteristics of approved bearing trees. Mr. Van Mons added a remark which we do not recollect to have met with in horticultural, writings :- That by sowing the seeds of new varieties of fruits, we may expect with much greater probability to obtain other new kinds of good quality, than by employing the much wanted in the oak. seeds even of the best old established sorts. He likewise gave it as his opinion, that if the kernels ponds, an acre each, one above another, on a of old varieties were to be sown, it would be bet- stream, which turned a mill below the ponds. 19 ter to employ those of other countries similar in An. 400.

Translated from the French for the Plymouth Memorial.

ON THE CULTURE OF ROSE BUSHES.

Roses are increased by seed, buds, layers or shoots, and by grafts on other rose bushes.

The rose from the seed comes slowly; it diversifies varieties.

The most usual method to multiply roses is by buds and layers. Grafting succeeds better than budding with the choicest roses.

Plant not rose bushes either during frosts or great heat.

Dry earth causes more fragrance, and higher and stronger colours.

Moist earth, larger roses, less colour, and slower and later growth.

The rose will not flourish in pots or boxes, on account of its numerous roots.

The blooming of yellow roses may be anticipated, by pulling off the buds and leaving but a few. The hundred leaved rose will not flourish in the shade.

The white double rose stifles the growth of those near it; particularly the yellow rose.

Pruning agrees generally with every species of rose, except the yellow and the musk rose.

If rose bushes are watered with a ley made from the ashes of burnt rose bushes the salts contained in it will wouderfully contribute to their growth.

SWAMPS.

I have read of a swamp, of which meadow could not be made; and, being a disagreeable object, large deep ditches were dug, and the earth thrown up into little islands, which were planted with willows, and formed beautiful clumps of trees, here and there; so that nothing was seen but these trees, and various peeps of water. The ditches answered for fish ponds.

Lombardy poplar is planted about habitations in America for ornament; but an Italian gentleman says, in Italy it is sawed at mills, whilst green, into boards of 1, 1 to one inch thick, and into plank 2 to 3 inches thick; and is greatly applied to making packages for merchandize. Nails are not apt to draw in these packages, the boards whereof are thin, and the wood heing tender is easily cut into thin boards with hand-saws. In 20 years their trunks, he adds, grow to be 2 feet diameter and 30 long. Boxes of it made strong for the use of vineyards last there 30 or 40 years, which induces the expectation that they future merit. If a pear or an apple possess prom- uable ornament. Of other willows and osiers, the

Larch (Pinus Larix, Lin.) must have the first attention of landed men. See Doctor Anderson's 3d volume of Essays on Husbandry, for a full and satisfactory account of it, and of the extensive propagation of it in Scotland, with its useful and durable qualities, and its very quick growth, so

Mr. Young speaks of fish-ponds, and of four

GAME IN NEW SOUTH WALES.

The following account of the sporting, &c. at Bathurst, in New South Wales, is given by a recent traveller :-- " Bream is caught in all the rivers, bites very fast, and is nearly as large as the salt-water fish of the same name, caught on the coast. The cod is the most remarkable fish at Bathurst, and is not unfrequently caught as heavy as fifty, sixty, and even ninety pounds; when eaught in large quantities, they are generally dried, and may be seen in this state hanging up inside the roofs of the settlers' houses. Game is plentiful; ducks, snipes, widgeon, teal, abounding near the rivers. I saw eight black ducks brought down at one shot, weighing, as I guessed, four pounds each. These are delicious eating. Sometimes the settlers will throw up a breast-work of boughs, near some favourite rendezvous of the birds, close to the water, and when they have collected near the spot, the sportsman fires from behind his battery, and does dreadful mischief among them, forty ducks having been brought down in this manner at one fire. The plover and bronzewinged pigeon are very numerous, and easily shot; the latter, especially, is a beautiful creature, and twice the size of the domestic pigeon, looks well, and eats well at table; but the best sport at Bathurst is the quail; this is the partridge shooting of New South Wales generally; but the Bathmst settlers seem to enjoy it in perfection, having a much greater scope of clean open country."

IMPORTANT ARTICLES OF TRADE.

The demand for Rattlesnakes and Alligators, for the foreign market, is steady and the trade brisk. "It is a fact, (says the Savannah Georgian) the' perhaps not generally known, that both Rattlesnakes and Alligators are regularly reported by the Liverpool papers, as imports with Cotton, Rice, and other staple articles." Who will say after this that the United States do not beat the world all hollow in the variety and value of their productions?

It must be owned, however, that the North. ingenious as they are in the manufacture of wooden nutmegs and pumpkin seeds, are obliged to yield the palm to the south in their articles of export; and our Southern neighbors have no reason to find fault with the tariff, while they monopolize the snake and alligator trade .- Berkshire American.

Due for cotton .- Cotton at Smyrna is dyed with madder, in the following manner: The cotton is boiled in common olive oil, and then mild alkaliserved by British horticulturists,—that the fruit may last long in fence-rails or logs. As fuel, he being cleaned it will then take the madder dye. This is the fine color we see in Smyrna cotton yarn. I have heard that the sum of five hundred pounds was given in England for this secret.

DOMESTIC ECONOMY.

Some of the leading principles in domestic economy may be comprised in few words. For instance-

Ready money purchases the best market.

Keep a minute account of every outlay, however trifling.

Be not tempted to purchase any unnecessary article by its apparent cheapness. If your means will allow it, do not buy in very small quantities articles in constant family use, and which are not perishable.

GUATEMALA.

The condition of this country, as described by Mr Dunn, is deplorable, The population is composed of European Spaniards, Creoles or Americans descended from Spaniards, Indians, negroes, mulattoes, mestizoes, &c. The whites are divided into two parties-one aristocratic and superstitious; the other republican, but of the French revolutionary school. The mulattoes and other mixed races form the physical force of the nation. With some exceptions, all are ignorant, corrupt and licentious. Guatemala, is, perhaps, the only country on earth where females carry daggers in the garters of their stockings for the purpose of stabbing their fellow creatures.

Intoxicating liquors are the great source of the wretchedness and degradation of the people in Guatemala, as well as in some other countries .-Habits of intoxication prevail among the lower classes; the multitude of spirit shops offer powerful temptations, and the liquor is sold so cheap that the poorest Iudian can become beastly drunk when he pleases. "These wretched creatures," says Mr Dunn, "may be seen rolling about the streets and suburbs, in a state sometimes approaching to madness, and sometimes to insensibility under its overpowering influence."-Hamp. Gazette.

VINEGAR FROM HONEY.

tween the 70th and 80th degrees of Fabrenheit's other employments, for it makes a very important thermometer, it will in a short time become a very difference in the expense of labour. THE SOUTH WEST WIND.

the published sermons of the Rev. Dr. Freeman, of butter which is mostly used in Constantinople, this city: The south-west is the pleasantest wind which blows in New England. In the month of salt it, but melt it in large copper pans over a very October, in particular, after the frosts, which com- slow fire, and scum off what rises; it will then monly take place at the end of September, it frequently produces two or three weeks of fair weather, in which the air is perfectly transparent, and by salt. I have had butter, which when fresh the clouds which float in the sky of the purest was melted and scummed in the Tartar manner, azure, are adorned with brilliant colors. If at this season a man of an affectionate heart and ardent imagination should visit the tombs of his friends, the south-western breezes, as they breathe through the glowing trees, would seem to him almost articulate. Though he might not be so wrapt in enthusiasm, as to fancy that the spirits of his ancestors were whispering in his ear; yet he would at least imagine that he heard the still, small voice of God. This charming season is called the Indian summer, a name which it derived from the natives, who believe that it is caused

court of their great and benevolent god Cautautowwit, or the south-western, god, the god who is superior to all other beings, who sends them every blessing which they enjoy, and to whom the souls of their fathers go after their disease.

INTERNAL IMPROVEMENTS.

The Vermont Chronicle has recently published a valuable table of all the Canals and Rail Roads, is allowed to be of the greatest value for manure. completed or in progress in the United States .-Among those completed, are the Middlesex Canal between Boston and Chelinsford, twenty nine and a half miles long - Hudson and Erie, between Albany and Buffalo, three hundred and sixty three miles-Champlain, Albany and Whitehall, sixty three miles-Oswego, connecting the Hudson and Erie Canal, thirty eight miles-Seneca, connecting Seneca and Cayuga Lakes with the Hudson and Erie Canal, twenty miles-Chesapeake and Delaware, from Delaware river, fourteen miles-Port Deposite to the Delaware line, ten miles-Schnylkill, Philadelphia, to Mount Carbon, one hundred and eight miles-Union, from Reading, to Middletown, seventy nine miles-Dismal Swamp, pear the mouth of James River, to Albemarle Sound, twenty three miles. There are ten other Canals in progress and eleven others projected .-Of the Rail Roads enumerated, two are finished, one nearly completed, and nine projected .- Salem

Ploughmen.-To train ploughmen to habits of activity and diligence is of great importance. In some districts they are proverbial for the slowness of their step, which they teach their horses, whereas those animals if accustomed to it, would move with as much ease to themselves in a quick, as in a slow pace. Hence their ploughs seldom go above two miles in an hour, and sometimes even less; whereas, where the soil is light and sandy, they might go at the rate of three miles and an half. Farmers are greater sufferers than they land, however, is stiff, and deep ploughing is ne- plants.

Mode of preserving butter .- The following is tak-The following beautiful passage is from one of en from the journal of a Turkish traveller: "The comes from Crim and the Kuban. They do not when it was melted. We preserve butter mostly and then salted in our manner, which kept two years good and fine tasted. Washing does not so effectually free butter from the curd and buttermilk, which it is necessary to do, in order to preserve it, as boiling or melting; when the salt is added to prevent the butyracious part from growing rancid, we certainly have the best process for preserving butter. The melting or boiling, if done with care, does not discolor or injure the taste."

At a late meeting of the Royal Institution, a piece of cambric was exhibited, said to be made by a wind, which comes immediately from the from the bark of the pine-apple tree in China.

SEA WEED FOR MANURE.

Ore weed, sea weed sea ware, or sea wreck .-These names are applied to all the vegetables which grow plentifully in the sea, and on the muddy and rocky parts of the shore below high water mark.

The sorts are cl. effy three; the kali, or rockweed, which strongly adheres to rocks, and which The alga, called cel grass, or grass wreck, is of the next rank as to its richness. But there is another sort, consisting of a broad leaf with a long shank or stem, of an inch diameter, by some ignorantly called kelp; this is said by Sir A. Purves to be of the least value of any of the sea weeds. However, none of them are unimportant for fertilizing the earth.

All vegetables when putrefied are a good pabulum for plants; for they consist wholly of it. But the value of marine vegetables is greater than that of any other; for, besides the virtues of the other, they contain a large quantity of salt, which is a great fertilizer. Mr. Dixon thinks those weeds which grow in the deepest water are the hest .-Perhaps they contain a greater proportion of salt than those which grow near the shore, as they are seldom or never wetted with fresh water.

A great advantage that these plants bave above any other, is their speedy fermentation and putrefaction. The farmer has no need to wait long after he has got them, before he applies them to the soil. The rock weed may be ploughed into the soil, as soon as it is taken from the sea. This is practised in those parts of Scotland which lie nearest to the shore; by which they obtain excellent crops of barley, without impoverishing the soil .-Neither have they any occasion for fallowing to recruit it." In hills of potatos, it answers nearly as well as barn dung. I have known some spread it upon young flax newly come up, who say it increases their crops surprisingly. The flax may grow so fast, and get above this manure and shade If a pound of honey be dissolved in three or four imagine, by the habitual indolence of their work- it, so soon, as to prevent evaporation by the snn quarts of water, and exposed to a temperature be- men, which extends from the plough to all their and wind; so that but a small part of it is lost;and flax is so hardy a plant that it does not suffer by the violence of the salt, like many other young

> But I rather think it is best to putrefy sea weeds before they are applied to the soil. This may speedily be accomplished by laying them in heaps. But the heaps should not lie naked. Let them be covered with loose earth or turf; or else mixed with it, changing to a salt oily slime, very proper to fertilize light soils, and not improper for almost any other.

As to the eel grass, &c. the best way is to cart preserve sweet a long time if the outter was fresh it in autumn into barn yards, tilling the whole areas with it, two or three feet deep. It may be either alone, or have a layer of straw under, and . another above it. When it has been trampled topieces by the cattle, and mixed with their stale and dung, it will be the fittest to be applied to the soil. It being a light and bibulous substance, it will absorb the urine, which is totally lost by soaking into the earth, unless some such trash be laid under cattle to take it up, and retain it.

Farmers who are situated near to the sea shore. have a great advantage for manuring their lands. If they were once persuaded to make a spirited improvement, they might enrich their farms to almost any degree that they please. They should visit the shores after spring tides and violent storms and with pitchforks take up the weeds, and lavthem in heaps a little higher up upon the shore; not usually show; not one of the hurdles upon next spring tide.

rocks; and fill them with weeds. Can they be so Vaucluse. stupid as to neglect doing it? It is even worth while to go miles after this manure with boats, when it cannot be done more easily. It has often been observed that manuring with sea weeds is similar weather is certainly not in the recollection an excellent antidote to insects. It is so, not only in the ground, but also upon trees. I have an ortree, just where the limbs part from the trunk; af- late, and it must be exposed to the frosts which And the month of March is perhaps better still.

insects.

faction of manures. This may be in some measedly a great advantage in such a practice.

Another advantage of this kind of manure, which must not be forgotten, is, that it does not encourage the growth of weeds so much as barn dung. It is certain it has none of the seeds of weeds to propagate, as barn dung almost always has. But some suppose that its salt is destructive to many of the seeds of the most tender kinds of plants; if it be so, it is only when it is applied fresh from the sca, at the time of sowing. But even this is doubtful.

This manure is represented in the Complete Farmer to be twice as valuable as dung, if cut from the rocks at low water mark; that a dressing of it will last three years; and that fruit trees which have been barren are rendered fruitful by laying this manure about their roots .- Deane's N. E. Farmer.

CURE.

In the southern provinces of France, where silk worms are bred, it is very common to find them attacked by a disease called the jaundice, in consequence of the color acquired by them : and very tleness, and soothed by mild usage, especially careful examination is continually made for the when young and ticklish, or when the paps are discovery of such worms as are attacked by it, tender, in which case the udder ought to be fothat they may be removed, lest the disease, being mented with warm water before milking, and contagious, should spread to others. The Abbe touched with the greatest gentleness, otherwise Eysecric, of Carpentras, had recourse to a remedy the cow will be in danger of contracting bad habin these cases, which though apparently danger- its, becoming stubborn and unruly, and retaining ons, has been warranted by the success of twenty her milk over after. A cow never gives down years. He used to powder his worres over with her milk pleasantly to the person she dreads or quick lime, by means of a silk sieve: he then gave dislikes. The udder and paps should always be them mulberry leaves moistened with a few drops washed with clean water before milking; but care ing the leaves with an eagerness which they did ted into the milking pail.

which will at once prevent their growing weaker. which he raised his worms appeared infected with and secure them from being carried away by the the jaundice. It was at first supposed that the cocoons of silk were injured by this process; this Many arc so situated that they can drive their however is not the case, and his method of praccarts on a sandy, hard beach, at low water, to the tice is now adopted generally in the department of

THE CROPS.

We have again had rain every day last week. of the oldest inhabitants.

The grain crop in this District, nevertheless, if chard which has been for many years much an- the weather settles, of which there is no certain noyed by caterpillars. Last spring, about the last indication, may prove an average. On low lands, of May, I put a handful of rock weed into each and those not in good heart, it can now only ripen ter which I think there was not another nest form- are always more frequent in rainy seasons than in ed in the whole orchard. April is a better time dry. It has generally shot into ear. Where the to furnish the trees with this antidote to insects. soil has not been too wet, the straw is abundant, and will assist in making up the deficiency of hay Putrefied sea weeds should, I think, be used for which it is now certain must be much below the avcrops of cabbages, and turnips, and for any other erage. If the present weather continue it will be crops which are much exposed to be injured by found very difficult to secure the greater part of the crops; and already the little that has been One disadvantage attending the business of mowed remains exposed, or has been secured in farming in this country, is, that our cold winters an indifferent condition. The potato crop is backput an entire stop to the fermentation, and putre- ward, and whatever may be the quantity, the quality must be indifferent. The turnips have escapure obviated by the use of rock weed, which is so ed the ravages of the fly, which has in this neighfull of salt that it is not easily frozen: Or if froz- borhood at least, done very little injury, although en, it is soon thawed. I have been informed that in the lower parts of the District, in some places, some have laid it under their dunghills by the sides it has almost totally destroyed the wheat. The of barns; in which situation it has not frozen; but gardens have pretty generally been productive; by its fermentation has dissolved itself, and much the crop of fruit will be an average one, but the of the dung that lay upon it. There is undoubt- period of maturity will be later than usual .- Quebec Gazette, of July 28.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 15, 1828.

We invite the attention of the public to the able and interesting document, relating to the state of the Botanic Garden at Cambridge, given in this day's paper; which will, it is confidently anticipated, not only elicit the attention of the public at large, but call into action that liberality for which the citizens of Boston, and those who inhabit its vicinity, have ever been so honorably distinguish-Contributions to such an object will be eminently beneficial to the contributors; and be the most direct method of enabling our countrymen to avail themselves of those vegetable treasures. with which NATURE has enriched, and ART may DISEASE OF SILK WORMS, AND ITS embellish the "happy land we live in."

TO PREVENT COWS FROM CONTRACTING BAD HABITS WHEN YOUNG.

Cows should always be treated with great genof wine, and the insects instantly set about devor- should be taken that none of that water be admit-

EGG PLANT.

Mr P. B. Hovey, of Cambridge, has left at the New England Farmer office, some of the fruit of the Purple Egg Plaut, which measures sixteen inches in circumference; raised from seed sold at this place.

ON COWS GOING DRY TOO SOON.

If at any time a good milch cow should go dry before her milk is gone, get a young calf, and put it to her, in order to preserve her milk against another year; for it is well known, if a cow goes dry one year, nature will lose its power of acting in future .- Bath Papers, vol. 2, p. 294.

MILCH COWS SHOULD BE WELL KEPT.

The keeping of cows in such manner as to make them give the greatest quantity of milk, and with the greatest clear profit, is an essential point of economy. Give a cow half a bushel of turnips, carrots, or other good roots per day, during the six winter months, besides her hay; and if her summer feed be such as it should be, she will give nearly double the quantity of milk she would afford if only kept during winter in the usual manner, and the milk will be richer and of better quality.

The carrots, or other roots, at nineteen cents per bushel, amount to about eighteen dollars. The addition of milk, allowing it to be only three quarts a day for three hundred days, at three cents per quart, amounts to twenty-seven dollars. It should be remembered, too, that when cows are thus fed with roots, they consume less hay, and are less liable to several diseases, which are usually the effects of poor keeping .- Farmer's Assistant.

Thomaston .- This is the greatest mart for lime in the United States. The rock from which the lime is made, appears to be diffused over this town and Camden, the town adjoining. It is supposed 150,000 barrels are made in these two places in a year, but it is now so low in price, that it is scarcely worth the trouble of making and transporting it.

Bees .- E. Britton, Esq. of Little Falls, has now more than three hundred swarms of bees; two hundred of them young swarms, and all doing well. It is doubtful whether there are many individuals who can produce the like number.

The Greeks ascribe the invention of hours to Anaximander, who probably received it from the Chaldeans. It has recently been ascertained that. the division of the day into hours was known to and adopted by the Hindoos from their earliest

The Morning Herald, in its report of the first day's meeting at Ascot, states that, when the rain fell during the day, seven acres of umbrellas spread their protecting influence over the mass of spectators.

4.081,017 yards of domestic cotton goods were cleared from United States ports for ports in the Pacific, to the southard of California, in twentyeight vessels, in nine months ending in Jan, last.

We regret to learn that in some parts of the country the wheat is coming into ear very unfavourably.

William Lee, Esq. who has recently arrived in Leeds from France, has brought a small quantity of the seed of the cow-cabbage, which he had distributed amongst his acquaintance, in order to have a fair trial made as to its adaptation to this climate. The introduction of this tree cabbage may be of essential service to the community. In Plymouth it has been seen growing in the garden of Admiral Brooking to the height of eight feet, and in La Vendee it attains an altitude of from 12 to 16 or even more feet. It should be planted in a warm and sheltered situation; sixty plants are said to afford sufficient provender for one cow for a year, and as the side shoots are only to be used, it lasts four years without fresh planting .- London paper.

Some years since, a letter written in Arabie, was sent by the Emperor of Morocco to the King of England; but no person could be found in Britain to translate it. The same thing happened in the United States with respect to a letter from the Bey of Algiers to the President Madison. The French maintain a body of young men in Africa and Asia to learn the local languages, who if they prove good, are eventually made Consuls. With similar views President Adams attached young Mr. Hodgston, of Virginia, to Mr. Shaler's mission to Algiers. He has become a proficient in Arabic, and is Charge d'Affaires at Algiers. Mr. H, has discovered that the Berber language in Africa, is the Numidian; that of Syphax, Juba, and Masin-

A singular phenomenon has lately presented itself in the horse-bean. The maggot, which, it would appear, must have been very numerous last season, having secreted itself in the grain, changed into the aurelia of a small black fly, and is at this period eating its way out. We have witnessed several proofs of this circumstance in one sample, and it may be doubtful how far they are wholesome for horses until the bean is broken, when the fly becomes animated, and instantly commen-

the ny necomes animated, and instantily comments of the property of the can be raised to the most advantage, and their relative for most set except. — Essex Herald.

Substitute for ringing swine.—To prevent swine from digging in the soil, the best method is to cut the two tendons of their snouts with a sharp knife, and their relative for most swine and their relative for most swine and single swines. Each of the above articles is furnished by gentlemen practically acquainted with the two tendons of their snouts with a sharp knife, and their relative for most advantage, about an inch and a half from the nose. This Gardening and Horticulture, recently published in England, may be done with little pain, and no prejudice to the animal, when about two or three months old. Common practice of restraining them by rings fixed in the snout is painful and troublesome;they must be replaced as often as they give way, and that happens so frequently, that rings afford but little security against the nuisance .- Loudon.

Last year a poultry salesman in London sold 19,047 head of game. So much for prohibitory laws at variance with public opinion.

It has been stated to us that the quantity of fish transmitted from this port to the London market is so immense, that the carriage alone amounts to nearly £1000 annually .- Boston (Engl.) Gazette.

The ensuing Horticultural Fete is contracted for at a guinea per head; last year the appetites of the company were measured at nine shillings.

Invention .- A gentleman in Birmingham has in vented a music desk, to which is attached machinery turning over the leaves of the music book, without taking the fingers from the instrument.

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr Alphonae Loubat, having considerably enlarged his Vine-yard, on Long Island, where he now has, in full cultivistical hirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of r-ost from his father's extensive procure the best spectmens of r-tols from his father's extensive vineyards and unseries; in the districts of Bardelais, Clerac, and Buzet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1828.

Mr A. L. will eagage to furnish subscripers with the Grape Vine Rosts, before the first of March next, and forward them free of expense to the different vine where exhausting limit

yine Rons, before the first or arrest next, and nowant others of expense, to the different cities where subscription list shall have been opsued. The roots will be those years all, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in loxes, with some of the original soil in which they have been raised, which will greatly lacilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designed.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1600 roots or more, at the rate of 12 1.2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root far less than 50 — Roots only two years old, shall be paid for at the rate of 9 cents each, for 1000 or more; 12 1.2 cents for less than one 1000; and 18 cents for less than 50 roots.—Payment to be made on delivered to the received made so the state of the

18 cents for less than 50 roots.—Payment to be made on delivery of the roots.—Letters not received unless post paid.
Subscription lists are open at New York, with Alphonse Lou at 35 Wall street—Boston, E. Copeland, Jr.—Albany, R. M'Michael—Philadelphin, Van Amringe—Ballimore, Willard Rhoads—Washington City, Wm. Pairo.—Richmond, Davenport, Allen & Co.—Savaanah, Hall, Shapter & Tupper—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street & Co. Mr A. Loubat's book on the Culture of the Grape Vineand on the Making of Wine, may be found at the principal bork-sellers of the United States; and his agents will fornish them graits to subscribers. gratis to subscribers.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New Eugland Farmer, with the assistance of a number of scientific and Practical Horticulturalists in the vicinity of Buston and New York, is just published by J. B. Russell, Proprietor of the New England Farmer. The articles are arranged alphabetically and comprise the most useful Vectables and Factors which can be conveniently and economically columbated in the climate of New England and the Middle States; as well as the climate of New England and the Middle States; as well as in the climate of New Engano and the Model Packers as with a Trentise on Flowers, and on Landscape of Picturersque Garders, on the general management of the Silk Work, and the manufacture of Sik, and a Trentise on the culture of Grape Virks and the Strawberry. The article on First Trees contains an enumerical and description of all the Apples-Pears, Peaches, Cherries, Plums, Nectarines, Apricois, &c. &c. that can be raised to the most advantage, and their relative for

and the Transactions of the London Horticultural Society, the
New Americana Gardener is enriched by artirlesor extracts from
the writings of the following American gentlemen:

Wheeler. Price \$1.25-Six capies for \$6.00.

Seeds for Fall Sowing.

For sale at the New Eagland Farmer Seed Store, a fresh sup-ply of various Grass Seeds—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Oution, Brassburg do. Silver skin do, Prickly Spinach and Datch Cole for early greets. —various kinds of lettuce, carrot, recumber, cabbages, &c.— black Spanish or winter radich. &c. all warranted from black Spanish or winter radish, &c. all warranted fresh,

Orchard Grass Seed-growth of 1828. Just received at the New England Farmer Seed Store, No. 52 North Market Street,

52 North Market Street,
20 bushels of prime Orchard Grass Seed, raised, this season,
with the greatest care, by John Prince Esq.—warranted to see equal in purity to any ever inferred for sale in New England.
A supply of pure Gilman Wheat, raised by Payson Williams and Mr Winchester, is daily expected.

Seeds for the West Indies.

Merchanis, masters of vessels and others trading to the West Indies, can be farmismed with boxes of Seeds, as eried, suitable for that market, at from § 1 to 50 per box.—Last box contains upwards of sixty different stands of seeds, vegetable and ornamental, in quantities sollicient for a common k, then gractes.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushe), all warranted pure, and of the growth of 1327.

Farmer Wanted.

An intelligent, capable man is wanted to take charge of a Farm a few miles from the city. He must be able to produce un-doubted references, as to he knowledge of the basiness, babits of industry, &c. With one having the requisite qualifications an arrangement might be made for taking the fain on shares. FOR SALE,

An excellent Mare with her Colt, by the celebrated Horse Bellounder. Also, a Bull, two years old, by Denion-perfectly kind and good tempered. Likewise, one full blood Merino Ram, one Ewe, and one Lamb. Apply at the office of the N E. Farmer.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D." Boston bestell the purchase of the second by the brough the post-office.

Oat Meal, Oat Flour, Grotts, &c.

Just received at the New England Farmer Seed Store, a Just received at the Acw England Farmer Seed Stoff, a further supply of the above articles, viz. 30 barrels of fresh Oat Meal, fine bolted Oat Flour, Hulled Oats or Vermont Rice, Seotch Barley, &c. for sale in any quantities, wholesale or re-tail. Also a few caunisters of fine Oat Flour, neatly packed, at 50 cts. per cannister.

A Good Compositor

Is wanted at the New England Former office.

MISCELLANIES.

From the New England Farmer's Almanack for 1829; now in the press of J. B. Russell, proprietor of the New England Farmer and Horticultural Journal.

For the Calendar pages for the month of August, are the following lines; by T. G. Fessen-

HARVEST -- INTEMPERANCE

The arable fields and gay meadows behold. And laughing luxuriant landscape accord. In tributes of verdure, coamell'd with gold, The hard-handed bushandman's promis'd reward.

But pause ere you gather the bountiful crop, And listen to well meant advice of a friend. The evils which flow from intemperance stop, So far as your own good example may tend.

Avoid the inveterate habit of some. (Excessively foolish, atrociously sinful,) Now bloated with brandy, now reeling with rum. Now stuffing with whiskey a spanish brown skin-full.

With the fire of the elements raging without, If the fire of the still is consuming within, A body of adamant soon must give out, As the steel-sinew'd laborer soon must give in.

A man had much better be burnt at the stake, For thus he will finish hi: troubles much quicker, Than his own carcase take a blue blaze to make, And be burning for years with the fire of strong liquor.

They who are easily flattered are always easily

The petty vexations of life are like heggars; if you treat them kindly, they "call again;" but if following anecdote of a Yankee pedlar, and a you kick them from your door, they will be very likely to cut your acquaintance.

say nothing, you will have nothing to unsay.

whiskers, liable to thrust his head into a hole where he cannot draw his haunches through.

True pith .- The force of language is apt to be much injured by the multitude of words. A re- the pedlar could. A bet sufficient to moisten the spectable farmer, has the singular happy talent of throats of the whole company, was the consenot saying too much. A young man wishing to quence between the principal parties, though the obtain his consent to marry his daughter, called landlord, in proposing it, had no idea that his cusupon him one day when he happened to he in the tomer would accept, when, as he supposed, he field ploughing with his oxen. It was, past all must be certain of losing. Jonathan then directdoubt, a fearful matter for a diffident man to ed that Mynheer should be divested of his coat broach, and the hesitating lover, after running a parallel with the furrow several times round the field, and essaying with all his courage to utter the important question, at last stammered out,

I-I-I've been thinking, Mr. --, that-that as how I-I-I should be gl-gl-glad to-tom-m-mar-marry your daughter.

FARMER - Take her and use her well -- whoa, haw, Buck .- Berks. Am.

" Four and twenty Fiddlers" in a Whale's Belly .-- An entertainment has been given by Mr. Kessels, the naturalist of Gand, for the purpose of exhibiting an enormous whale, which M. Cuvier and others think must have reached the age of 9 or 10 centuries. The orchestra was arranged in the interior of the stupendous animal, and there were 24 performers .- London Weekly Review.

island, indirectly hinted to him in the presence of his Brutus; Charles the First his Cromwell; and an Irish physician who attended him, the proprie- George the III" ("Treason!" cried the speakty of making a will in a country where people er; "treason, treason!" echoed from every part were so apt to die-the physician thinking his of the house.)-It was one of those trying mojudgment called in question, tartly replied, "By ments which are decisive of character. Henry St. Patrick, madam, I wish you would tell me faultered not for an instant; but fixing on the where people do not die-and I will go and end speaker an eye flashing with fire, continued, "may my days there."

This puts us in mind of a Hibernian minister who said during one of his sermons, that if there was no such thing as death in the world, we would get among us, and we should die off by number of respectable farmers clad in the usual thousands!!!

biteth smiling. But it is hard to know them from pomp, dingling his gold watch keys and seals in friends, they are so obsequious and full of protes- the most foppish manner. After swaggering tations; for, as a wolf resembles a dog, so doth a about the room a few minutes, he cried out and flatterer a friend.

passage from Africa to this country in 1707,) died and treat the company. No one at first appeared a few days since, in Dorchester county, State of disposed to accept his challenge, which only tend-Maryland - having attained the hundred and twen-ed to render the fop more inflated with an idea of

A London hatter advertises having invented a porous hat, to remedy complaints made against water proof hats of preventing the escape of perspiration and causing headachc. The inventor must have been a relative of the Irishman who made a hole in his shoe to let the water out.

THE YANKEE AND DUTCHMAN.

The N. Y. Commercial Advertiser relates the Dutch Inkeeper, near Catskill.

After some sporting and bantering between Silence is the best remedy for anger. If you Mynbeer and Jonathan, who had shown off some common slight of hand tricks, the said Jonathan A man without wisdom is like a cat without declared that he could swallow his robust host! Notwithstanding that Jonathan had already played off several of his Yankee tricks which puzzled the good people exceedingly, yet the assertion was 100 great a monthful for them to swallow, if and boots, and be stretched longitudinally upon the old oaken table which had stood in the barroom for half a century. These arrangements having been made, Jonathan voraciously seized upon the honest landlord's gouty great toe, which he pressed rather violently between his teeth, giving the good man a twinge which caused a writhing movement and a groan. "Dunder and blixum!" exclaimed Mynheer: "Vat te teffil do ye pite me sho for?" "Why, you darn'd great fool," said Jonathan, "You didn't think I was going to swallow you whole, did you?" A burst of laughter proclaimed Jonathan the victor, and Mynheer had to pay the toast and toddy.

Patrick Henry. - When Patrick Henry, who gave the first impulse to the ball of the American revolution, introduced his celebrated resolution on the stamp act into the House of Burgesses of Vir-An Irish gentleman being taken ill of a yellow ginia (May, 1765,) he exclaimed, when descanting

profit by their example. If this be treason make the most of it."-Percy Anecdotes.

Original Anecdote .- In one of our country tavshould increase to such a degree, that the plague erns a few years since, there happened to be a habit, when a spruce young gentleman came in, rigged in the highest style with a watch in his Fatterer .- A flatterer is said to be a heast that pocket, who strutted around the room with great challenged any man in the room to drop money with him, one piece at a time, and the one whose Longevity. Mary Fish, (who was born on a purse held out the longest should take the whole his superior wealth, and he became the more earnest. At length, a rusty looking, but shrewd old farmer observed, if no one else would accept of his offer, he would do it. "It is done," said the fop, and immediately called on a third man to hold the hat, and commenced the game, by dropping a piece of money into the hat. The former then put his hand into his pocket and took out what was called a bung-town copper, and dropt it into the hat. The fop immediately dropt in his second piece, when the farmer, feeling in his pockets after another piece, but finding none, gravely observed, "I own you beat, I've got no more-you may take the whole and treat the company .- Trent. Emp.

> Curiosity .- Large flocks of swallows are daily seen on the small bridges on the turnpike between Chelsea and Lynn. On the bridge nearest to Lynn may be seen at all hours of the day one which mixes with the rest in color perfectly white. For several days past it has been noticed with much pleasure by the passengers passing in the different stages .- Centinel.

BOSTON, FRIDAY, AUGUST 22, 1828.

No. 5.

AGRICULTURE.

We publish the following extract of a letter from a gentleman in Washteoaw County, Michigan, to the Editor of the New England Farmer, as a good comment on the heueficial effects of Internal Improvement. Who would have predicted 'en years since, of a cargo of Flour being sent from the interior of Michigan to Boston, and sold profitably at 5 or 6 dollars per parrel. We recollect the accordite of twenty barrels of grain being sent from New York city to Sacket's Harbor, about sixteen years since. It was of course transported in wagons; eight barrels of the grain were consumed by the horses on their journey-four left for the use of the troops-and eight more relained for the horses on their return.

"The regularity with which I receive the New England Farmer, merits something besides a mere acknowledgement. But money is so extremely scarce here, that I shall be under the necessity of deferring payment until fall, when I intend to make a shipment of Flour to Boston, when you can take, on account, two barrels of our Michigan, which you will find not inferior to the best Genesee Flour. Our wheat barvest has been favorable this season, and the weather fine for harvesting it ; and, above all, we have been blessed with a remarkably healthy season."

GATHERING WHEAT.

MR FESSENDEN-I saw in a late New England Farmer, the method the English sometimes adopt to cut their wheat. I believe (for I have not the paper before me) the New Encyclopedia is credit ed therefor, as it respects the description. Having for several years past either cradled or mayad my wheat, the method abovementioned appeared to me so reasonable, at the same time so simple. that with one hour's work I was enabled to bring it into operation, much to my profit and satisfaction. I found on trial that one of the bows could be dispensed with, by adding a preventer brace, or regulator, thus:

The English, it would seem, have the standing grain on their left. On trial I found it had better stand on the right, the same as grass, with a boy to follow to place the grain which the scythe leaves, at an angle of 45 degrees to the direction of the mower. The bow may stand at a right angle with the scythe and regulated by the brace according as the grain stands, or leans; its length, according to the length of straw to be cut; mine is about 20 inches from the heel of the scytle.-Three small holes the size to receive a rake how, is all that is needed in the snead made use of for grass, as the bow and brace can be taken out in a moment.

The acre of wheat ent by me the present season was strawed sufficiently large, for 40 bushels, had not our abundant rains beat down half the field where the straw was most abundant and at a season when the kernel had but half filled .-The crop is a good one, however, as the sample accompanying this, will declare. This wheat is

known by the name of the GILMAN WHEAT, its great product having drawn the premium six years of the tree on which it was discovered. It apin eight. I was a little more than seven hours in peared to have ceased feeding, having fixed itself cutting the acre. Four men with sickles would firmly by its feet to the bark of the tree, preparaprobably have been a longer time, with a further loss of twice the heads or cars where the grain was lodged. As the scythe was laid close to the ground (the field having been rolled in the spring, after picking off the larger stones) the rakes followed the binding, thereby saving all. To have cradled it would have been impossible.

As an apology for troubling you with this, the writer will merely mention his conviction for years, that the agriculture of New England must rise, or her hardy sons must fall.

Yours, &c.

Fitchburg, Aug. 15, 1828. P. WILLIAMS.

FOR THE NEW ENGLAND FARMER.

INSECTS.

Ma Fessenben,-I take the liberty to send you a limb of an apple tree, with an animal, with eight or ten legs, two and a half inches long, which stuck so fast to the limb, that the person who cut coarse silky substance covered with grains of it off, thought the limb was affected with the can- earth, and becomes a chrysalis. This survives ker, and in cutting it off, the animal to his great the winter, and about the last of June or first of surprise moved. As no one in this neighborhood July the perfect insect is disclosed. It is nearly ever saw an animal of this kind before, I thought related to the Peach-tree insect, and belongs to it might be a public benefit, to have some agricultural gentleman examine it, and if any thing new, to have a description of it made public.

A SUBSCRIBER.

Newburyport, Aug. 5, 1828.

On the receipt of the above, we forwarded the insect together with the limb of the apple tree, to which it was attached to Dr. T. W. HARRIS, of Milton, Mass. whose investigations as a naturalist, and entomologist, have been highly honorable to himself, and essentially serviceable to the interests of agriculture. Dr. HARRIS, in reply, sent the following communication, which will be read with an interest, proportioned to the science and the utility of the suggestions it developes:

THOMAS G. FESSENDEN, Esq.

DEAR SIR, -- Your note of the 6th inst. was received on Saturday evening. The box with its contents, sent you from Newburyport, arrived safely. The insect, which was a caterpillar, belonging to the nocturnal Lepidoptera, had formed its cocoon beneath the cover of the box, and was already changed to a chrysalis, in which state it approach very near and remain watching her a will probably remain until next spring. Should it however, become a perfect insect before that time, (as is sometimes the case) you shall be informed of it, and of the genus to which it belongs, which cannot till then be determined.

The cocoon, or rather demi-cocoon, resembles brown paper in color and texture, and has intermingled, in its construction, a few hairs evidently derived from the body of the caterpillar. In form it is oblong, oval, and flattened; and is complete only on one side, the corresponding side being replaced by the cover of the box. By making a hole through the box above, I was enabled to see the chrysalis, which is of the common shape, and abont one inch long. It was alive and moved its the last of June till the middle of August, some tail very briskly when disturbed.

The caterpillar undoubtedly fed on the leaves tory to covering itself with its cocoon.

It will be well to apprize your readers that the second broad of slug worms will shortly appear, some of them as soon as the 15th, of the present month. The first brood was numerous, and according to former experience, the second will greatly exceed it in numbers. Those who have young and valuable trees had best immediately provide themselves with the simple apparatus for sifting ashes, &c. on the leaves, as recommended by Mr Lowell.

You may have observed that the squash and other cucurbitaceous vines frequently die, during this month, down to the root. On examining the stalk, near the root, you may discover a small whitish grub, which lives in the centre, and is the cause of this premature decay. The grub, when it has attained its full size, is about one inch long : it then enters the ground, forms a cocoon of the same genus. It does not appear to have been described by Linnæus nor Fabricius. Still, as I have not access to many of the works containing descriptions of American insects, I cannot confidently procumee it to be a nondescript, and therefore give it a specific name provisionally, only till it shall prove to be entitled to an older one.

Ægeria Cucurbitæ.-Body tawny, with four or five black dorsal spots; anterior wings olivaceous brown; posterior wings, except the margin and nervures, hvaline : tibiæ and tarsi of the hind legs densely fringed with fulvous and black hairs. Length of the body three-tenths of an inch. The wings expand one inch and one onarter.

The above brief description will serve to identify the female, and the specific name will indicate the genus of plants on which the larva feeds.

On the 10th of July I observed one of these insects in the act of depositing her eggs. She continued flying and frequently alighting near the roots of the vines, and each time she alighted bent the tail downwards to drop an egg. So intent was she in this business, that she suffered me to long time without being alarmed.

As the eggs are deposited and the larvæ make their first attacks near the root, it may be suggested to your agricultural friends, that, possibly, smearing the vines round their roots with blubber oil may repel the invader. The experiment, to be successful, should be made early in July.

The autumnal caterpillar, or, as it is commonly called, web-worm, has made its appearance in great numbers. Not only our forest and ornamental trees, but our fruit trees are now disfigured with their webs. The eggs are deposited in a cluster on a leaf near the extremity of a branch. The young larvæ when hatched (which happens from broods being early, others late.) cover the upper

surface of the leaf with a web, beneath which wishes of some respectable friends, by communi- native of France, possessing large estates in that they feed in company, devouring only the upper cating to you the result of numerous experi- country and in the United States, assured me, aflower cuticle and nervures untouched. As they increase in size, they progressively extend their lar is about one inch and one eighth long, and is of a yellowish colour, the back covered with contiguous black spots and a double series of small cess is extremely simple, and as far as I can learn black tubercles, and the sides with several rust coloured tubercles. From the tubercles proceed thin bunches of diverging, slender, whitish, bearded hairs, intermingled with a few black ones .-The head and feet are black. When it has ccased feeding, the caterpillar leaves the tree, and, in some secure place, forms a thin cocoon, in which it becomes a pupa, and remains during the winter. In the following June it makes its esca and is then a small white miller or moth, frequently seen round houses in the evening. It helongs to the genus ARCTIA, and the species has not, to my knowledge, been described. It may. therefore, for the present, be denominated, from its well known habit, the weaver, or ARCTIA textor. Body and wings white, immaculate; anterior thighs tawny; feet blackish above. Length of the wings one inch and two-fifths.

Such being the habits and metamorphoses of this insect, it is apparent that, at no time, can they so well be attacked, with the view of arresting them in their destructive career, as when the larvæ are small, and the webs just begin to appear. The leaf or leaves which then support them should be stripped off, and their inhabitants be immediately crushed or burnt, without being suffered to disperse.

The description of our suppose! nondescript destructive insects might be greatly extended, but this paper is already sufficiently prolix, if not tiresome both to yourself and your readers.

You will please, whenever you wish, command the services of your humble servant,

Milton, Aug. 11, 1828.

GRAPE VINES.

MR. FESSENDEN, - I perceive by your paper of the 15th inst. that one of your correspondents under the signature of "J. B." says that he has succeeded very well by engrafting the grape the last spring. Your correspondent, (or any other horticulturist) would confer a favor on the cultivators of the vine, if he would, through the medium of your paper, communicate the particulars of the course pursued.

Were the sciens of the first or second years' growth ?-At what time were the scions cut ?-Was cleft or w ip grafting resorted to?-Was the scion inserted near the root of the stock, or in the upper branches? A. B.

Dudley, Mass. Aug. 20, 1828.

From the American Farmer.

Valuable practical information and hints on the custture of the Vine.

[From the author of "Coxe on Fruit Trees."]

Sir. - The cultivation of the vine has become of our country, that I cheerfully comply with the have consulted—and a highly intelligent friend, a mixture of any other metal. Mr de Gaffron has

When the stock is sufficiently large, two sciens may be inserted, and if successful, may be reduced to a single stock, or one of them may be laid down by training, about six inches under the surface, to form another vine which the second year will be nearly equal in strength and productiveness to the parent vine. From the facility with which this operation may be performed, and the short interruption it creates in the bearing, it will be easy to change any number of vines from unproductive and inferior kinds, to such as may be adapted to the soil, climate, and object of the cultivator. Foreign and tender kinds may be speedily acclimated, and an early diffusion of the finer kinds through our extensive country may be accomplished, wherever native stocks are to be found.

I believe this mode of engrafting will be new to the greater portion of your readers; it certainly is not noticed by the Abbe Rozier, by La Nouvelle so important to the health, morals, and prosperity Quintinge, by Miller and Forsyth, all of whom I analyzed them, and found that there was no ad-

MALLEABLE CAST IRON.

A remarkable instance occurred to my knowledge of an individual fact, which might have been of the utmost use to society, but which, owing to the state of knowledge and government in-Turkey, was wholly lost to the world. An Arabian, at Constantinople, had discovered the secret of casting iron, which, when it came out of the mould, was as malleable as hammeren iren; some of his fabrication was accidentally shown to Mr de Gaffron, the Prussian charge d'affaires, and Mr Franzaroli (men of mineralogical science) who were struck with the fact, and immediately instituted an enquiry for its author. This man, whose art in Christendom would have insured him a splendid fortune, had died poor and unknown, and his secret had perished with him !-His utensils were found, and several pieces of his casting, all perfectly malleable. Mr Franzarolt since been made superintendent of the iron manufactory at Spandan, where he has in vain atemuted to discover e process of the Arabian.

. From the Milton Gazette.

\ WONDERFUL DISCOVERY RECENTLY MADE IN AN OLD HORSE'S AGE.

"Tis to the pen and press we mortals owe,

Since the age of that noble animal, the horse, after a certain period of life, (that is to say) after the marks in his incisors and cuspidati are entirely obliterated, to be able to ascertain his age, with any tolerable degree of certainty, appears to the generality of "horse age" judges," to be a subject of very much uncertainty. I now take the liberty of laving before the public through the medium of your paper, an intallible method, (subject to very few exceptions,) of ascertaining it in such a manner after a horse loses his marks, or after he arrives to the age of 9 years or over, so that any person concerned in borses, even of the meanest capacity, may not be imposed upon in a horse's age, from 9 years of age and over, more than 3 years at farthest, until the animal arrives at the age of twenty years and upwards, by just feeling the submaxillary bone, or the hone of the lower

This method I discovered, by making many anatomical observations on the skulls of dead horses and repeated dissections. In order, therefore, to elucidate the above, I must in the first place beg leave to remark - that the submaxillary bene, or the lower jaw bone of all young horses, about 4 or 5 years of age, immediately above the hifurcation, is invariably thick and very round at the bottom; the cavity of said bone being very small. contains a good deal of marrow, and generally continues in this state until the animal arrives at that period which is generally termed an "aged horse," or until the animal acquires his full size in his height or thickness; or according to sporting language, is completely furnished, with very little variation. But after this period, the cavity as aforesaid becomes larger, and more marrow is contained therein. Hence the submaxillary bone becomes thinner and sharper a little above the bifurcation.

This indelible mark may always be observed in a small degree in horses about 8 years of age; but at 9 years old it is still more perceptible. It continues growing a little thinner and sharper at the boom, until 12 years of age. From thence until 15, it is still thinner, and about as sharp as the back of a case knife near the handle. From this period until the ages of 18, 19, 20 and unwards, it is exceedingly so; and is as sharp in many subjects as the dull edge of that instrument.

Rules .- 1. Put your 3 fingers about half an inch or an inch immediately above the bifurcation, and grasp the submaxillary bone; or the 'ower jaw boue. If it is thick at the sides and very round indeed at the bottom, the animal is most certainly under 9 years of age.

2. If the bone is not very thick, and it is pereeivably not very round at the bottom, he is from 9 to 12 years of age, and so on. From 12 to 15 the bone is sharper at bottom and thinner at the sides, the bottom is generally as sharp as the back of a case knife; from 15 to 18, 19, 20 and upwards, without many exceptions, the bone, when divested of its integuments, is as sharp as the dull edge of that instrument.

3. Allowances must always be made between heavy, large western or wagon horses, or carriage crution of horses, the performer in a little time, serves the lower jaw bone of dead horses.

EXTRACTS

From an "Annual Address delivered before the Rhode Island Society for the encouragement of Domestic Industry." By WILLIAM E. RICHMOND.

"The most obvious and the most natural division of human labour is three-fold-the labour of Production ; the labour of Manufacture, and the labour of Distribution. In the first are comprehended Agriculture, Fisheries, Mining, and all other labours by which crude materials are cre-In the second division is included every process by which the crude productions of nature and of art are prepared for consumption. The third division comprehends the labours bestowed in ufacturer, as from the latter to the consumer. This simple view of the labours of the comununity, mutually dependant and depending as they are, should inculcate on our minds the unity and indivisibility of their interests. United and harmonious in their movements, they support and assist each other, while they promote the common welfare: Divided and discordant in their views and operations, their jealousies are destructive to themselves and to the commonwealth. Let it. promote so desirable a union of sentiment and feeling. Without the Farmer, society could not exist: Without the Manufacturer, it could not exist in comfort: Without the MERCHANT it could not enjoy the conveniences and luxuries which it desires.

In praise of Agriculture, that parent and nurse of civilization and the arts, and in recommending her to the patronage of an enlightened people, too much cannot be said. It was observed by the most eloquent of that school of philosophers which laid the train for the grand moral explosion, which distinguished the close of the last century :- That he who first enclosed a field, and planted it, and called it his own, laid the corner stone of the social structure, and is accountable for all the evils of society. There is more of spleen and misanthropy in this sentiment, however redeemed by the splendid style in which it is dressed, than of sound argument. It supposes as true the very thing which was to be demonstrated; namely, that society is a curse, instead of a blessing to mankind. I quote the that the appropriation, enclosure and cultivation of lands are the bases of human society and eivilization. Rousseau, himself, admits, that he who opposes them is a savage, and, that he who would abrogate them wishes to become a savage. It is by permanent residence and exclusive proprietorship, only, that men are encouraged to till the earth-that a surplus of food is produced for the support of handicraft trades-that population is condensed and wealth accumulated-that the higher arts and sciences are cultivated-that society is protected and embellished. No friend of our race would wish to restore that miscalled golden age, when man, as ferocious as the tyger, lay in ambush for the weaker animals, or, in his turn, fell a prey to the more powerful ones, by which he was surrounded.

"The labours of Husbandry are among the most healthy and invigorating employments of erh. Rural pursuits, more than any other, preman. "God made the country," says the prov-

serve the simplicity of manners and innocence of life which constitute the charm and promote the happiness of society. It is impossible to conceive New-York, in a work recently published, consida more attractive picture of life than that pre- ers intemperance as the prolific mother of human sented by a well-settled rural neighbourhood, where the lands are fertile and well cultivated; the buildings, fences and roads in good repair; the men industrious and temperate; the women good house-wives, faithful companions and tender mothers; the children well schooled, obedient ated, or reduced to the possession and use of man, and mannerly; the clergyman a teacher by example, as well as by precept; the physician and lawyer, skilled in their professions, supported ill effects on health of tight lacing, and remarks by their farms, and, emphatically, the guardians that almost every professional man has witnessed of the health and property of their neighbours; the fatal results of this abomination. He dissectthe transportation of erude and manufactured the school-master learned, faithful, and beloved articles, as well from the producer to the man- by his pupils. In the unruffled bosom of such died of disease caused by tight lacing, and found a retreat the votary of politics or pleasure might "the adhesion of parts and the derangement of ealmly bid adieu to the storms and frivolities of structure truly frightful." He adds, "the ingenuthe world, "nor cast one longing, lingering look ity of the ladies, perhaps, could not be better exbehind." How many such little communities erted than in contriving some method of preventmay be found in this our country, where exist ing such havor as is usually occasioned among the elements of that power which constitutes, at them from tight lacing and thin dressing." once, its safety and renown! Farmers, your lot | Eating opium and snuff .- Dr. R. states as a fact is truly enviable. You cannot be unmindful of well known to the faculty, that hundreds of feits advantages. Drinking ardent spirits .- This is the worst kind

A gentleman in the Strand, London, has just adopted a mode of generating gas over a common kitchen fire, and of parifying it so well by a new process, which is yet a secret, that it may not only be introduced with safety into houses, but without causing any bad smell. The novelty of the invention consists principally in the adaptation of a retort to a common kitchen fire.

Chesnut trees .- It is stated in Philips' History of Fruits, that the great chesnut tree near Mount Etna, is perhaps one of the most extraordinary trees in the old world. It is called "the chesnut tree of a hundred horses," from the following tra-ditionary tale: Jean of Arragon, when she visitpends upon its bark for subsistence. The cavity it a good relish. of this enormous tree is so extensive, that a house tree that shelters them, it is feared that this natur-|corn, or stiff dough. al curiosity will be destroyed by those whom it protects.

FATTENING SWINE.

"According to the opinion of the Rev. Mr Eliot, the best time in the year to shut up hogs to fatten them, is the month of August. 1 rather prefer the month of September, when it may be depended on, that they will not suffer at all by time enough to make them fat, before the weather becomes to be extremely cold.

He that attempts to fatten his hogs in winter will be a loser; for it has been found by long experience, that they do not gain in their flesh near so fast in a frosty, as in a temperate season. I therefore take care to get them fit for the knife by the beginning or middle of December, and I for the advantage of keeping the lean part of the pork for some time without salting; as it most commonly may be done by exposing it to frost, in the coolest part of a house.

But a very important question is, what food and management is best in fattening swine? Peas answer well, when the price of them is low. But I am constrained to give the preference to Indian corn. Let them be fed in September with green ears from the field. There is nothing they will devour more greedily than this corn, and even the cobs with it.

picked out, and given to the hogs that are fatting, without delay; or as fast as they can eat them; for it will do them four times as much good in this dry it without its turning mouldy or rotten; so

that they will scarcely eat any of it in this state, unless they be kept shorter of food than fatting hogs should be.

pened must be given them.

If it be thought most convenient to feed them with corn of the preceding year, it should not be given them without soaking, or boiling, or grinding it into meal. For they will not perfectly dihard for their teeth. It has been thought by good more advantage to the swine for soaking it in water. But there is if I mistake not, still more advantage in grinding it. What new corn is given them, may be in ears, as it is not hardened enough for grinding. I know of nothing that will fatten hogs faster than a dough of meal and water. But as this is expensive food; the dough may be mixed with boiled potatos, or hoiled carrots .-

bility, when a heavy shower obliged them to take self; and it appears to make no material differ- clover. Swine feeding on clover in the fields will refuge under this tree; the immense branches of ence in their fattening. In this mixture, barley thrive wonderfully; when those (confined or not) which sheltered the whole party. According to meal will answer instead of Indian; which should fed on ent clover will fall away." The same genthe account given of it by Mr. Howel, this chesnut be attended to in our more northern parts, where theman asserts that hogs, while fatting, should contree is one hundred and sixty feet in circumfer- two bushels of barley may be as easily raised, as stantly have some dry rotten wood, kept in the ence-and although quite hollow within, the ver- one of Indian corn. Both kinds of meal I have pen, which they will eat occasionally, and it proves dure of the branches is not affected; for this spe- found to be a good mixture with boiled potatos; very beneficial to them. It is also declared, as cies of tree, (like the willow and some others,) de- but it should by all means be a little salted to give well by that gentleman as other writers, that food

While hogs are fatting, little or none of the has been built in it; and the inhabitants have an wash from the kitchen should be given them .-oven therein, where they dry nuts, chesnuts, al- Their drink should be fair water, which they relmonds, &c. of which they make conserves; but ish better than any other drink, and of which they as these thoughtless people often get fuel from the will drink a good deal, when they are fed only on

To prevent measles and other disorders in hogs, while they are fatting, and to increase their health and appetite, a dose or two of brimstone, or antimony, given them in their dough, is useful, and should not be neglected.

Some change of food may be advisable, in every stage of their existence, as it always seems to increase their appetite. But while they are fatting, laxative food in general should be avoided, as the heat in their confinement; and there will be these animals are seldom known to suffer by costiveness, especially when they are full fed, but often from the contrary disorder. If they chance to be costive, a little rye will help them.

In feeding, steady care should be taken that not one meal should be missed, nor mistimed, and their water should never be forgotten. They should always have as much food as they will eat up clean: but never more than that quantity, lest should choose to kill them still earlier, were it not they defile it and it be wasted. A little at a time and often, is a good rule.

If their skins be scurfy, or inclining to mangigess, a little oil poured upon their backs, will cause it to come off. And some say a small mess of rye now and then, as a change in their food, is good against these and other disorders.

If the issues in the fore legs should chance to get stopped, every attempt to fatten them will be in vain. These, therefore, should be watched; open with a corn cob.

Rubbing and currying their hides very frequent-In Indian harvest, the unripe ears should be iv, is of advantage to keep up perspiration. It is grateful to the animals, as well as conducive to their health and growth. A proper scrubbing post in the middle of their pen will not be amiss. state, as it will after it is dried, it being difficult to And during the whole time of their fatting, they should have plenty of litter. They will lie the more dry and warm, and it will be more than paid for, by the increase of good manure.

When hogs are killed, a single one should not After the unripe corn is used, that which is ri- be left to live alone in a pen. He will be apt to pine too much after his former companions. And in cold weather be will suffer for want of lodging so warm as he has been accustomed to do.

The fat of pork should be plentifully salted with the best and strongest clean salt. It will take gest much of the hard kernels; it being often too three pecks for a barrel. The pork should be kept continually under pickle; for if it be exposed ever judges, that the corn will be at least a sixth part so little to the air, it will become rusty and unpal-

Boiled or steamed clover hay will serve to keep hogs during winter, but the addition of potatos or carrots, boiled or steamed with the hay will be an improvement.

Mr. Young directs soiling swine in a yard in preference to feeding them on clover in the field during summer. But Judge Peters, of Pennsyl-

ed Mount Ema, was attended by her principal no- They eat these mixtures as well as dough by it- vania, says, "In smomer my hogs chiefly run on when soured by a proper degree of fermentation is much the best for fattening swine, and that one gallon of sour wash will go as far as two of sweet for that purpose. Mr. Young says, that the best method of feeding all kinds of grain to hogs is to grind it to meal, and mix it with water in cisterns for that purpose, at the rate of five bushels of meal to a hundred gallons of water .- Deane.

BATHING.

It is a common notion that bathing is of importance to the health only in summer. But this is a great mistake. It may, indeed be of more importance for the single purpose of cleanliness, for dust and perspiration, to require more frequent ablutions, in hot weather than in cold. But this is far from being the most important use of bathing .-To clear the pores of the skin, to soften the contractions produced by cold, to open the small vessel and tubes that are designed to carry the circulation to the very surface, are the great and salutary effects of bathing. In producing these effects, we perceive at once how bathing promotes health, especially at the season of the year, when we are exposed to autumnal fevers, and how it prepares the body for the rigours of winter. It is, also, obvious that the bath should be hot; not merely tepid or luke-warm, but considerably warmer than the body. Heat is a very subtle fluid and like all other fluids seeks a level, or an equilibrium. If you go into a bath somewhat colder than your body, your body loses heat; it imparts its warmth to the water till both are at the same temperature. The chill which is felt on coming from such a bath is evidence of this fact, and if found to be stopped, they should be rubbed and shows that the system has been injured rather than benefitted. But if the bath he warmer than the body, the balance of heat is produced by the water's imparting heat to the body, and the operation of it is to give a grateful impulse to the action of the system, and send the blood briskly to the surface and the extremities, opening the channels, clearing away obstructions, and diffusing a glow over the body, and a quiet joy over the mind, which are the unimpeachable witnesses of health, and the perception of which is luxury.

Troy (.N. Y.) Register.

Acorns .- These are sometimes given to poultry and would be found an advantageous food for fowls, were they dried and ground into meal .-Acorns can be preserved in a state fit for vegetation for a whole year by enveloping them in bees wax. Other seeds may be conveved from distant countries by the same means. Miller advises to plant acorns as soon as they are ripe in October, which will come up in the following April; because, if they are attempted to be kept, they will sprout, though spread thin.

Mr. Benjamin Peacock, of Bristol, killed a calf on the 22d of July, of five weeks and four days old, which weighed 162 lbs .- and yielded 171 lbs. of rough tallow.

CANADIAN AGRICULTURAL REPORT, FOR JULY.

Haymaking, which is generally the most pleasbeen the most unpropitious ever remembered by as fast as it fell; the consequence is, that grain of effect, all kinds, on fat lands, stood up to the middle in water for several hours together. Wheat is much NEW ENGLAND FARMER. rusted where strong, so that the quality will not be so good as expected at the middle of last month. Oats and Barley are ripening, but are knocked down in a shocking state; many fields are lying as flat as if they had been passed over by a roller. Stock all in good condition, but the produce of dairies is very low. Fruit has suffered much from the heavy rains, as well as from the high winds, and will not be so abundant as was expected. In fact, we have seldom known a time in which farmers have suffered more, or in which their minds have been kept in such a state of anxiety as during the past menth.

LONDON IN OLDEN TIMES.

Sir William Davenant thus describes London. as it was before the great fire.

"Sure your ancestors contrived your narrow streets in the days of wheelbarrows, before those to have been your founders' perspective; and where the garrets (perhaps not fer want of architecture, but through abundance of amity) are so here slender, there broad; and all most admirably different in their faces, as well as in their height and bulk. As for your ceilings, they are so low, that I presume your ancestors were very mannerly, and stood bare to their wives, for I cannot discern how they could wear their high-crowned hats.

"I now leave your houses, and am passing through your streets; but not in a coach, for they are uneasily hung, and so narrow, that I took them for a sedan upon wheels; nor is it safer for a stranger to use them till the quarrel be decided. whether six of your nobles, sitting together, shall step and give place to as many bottles of beer .-Your city is the only metropolis of Europe, where there is a wenderful dignity belonging to carts."

TO RENDER CUCUMBERS WHOLESOME.

Slice cucumbers into a basin of cold spring water, and it will not only make them eat by far more crisp and fine, but will also render them much more wholesome, and effectually prevent their rising in the stemach. The water will completely extract and take away the permicious juice of the cucumber, which is the principal cause of their so often disagreeing with the stemach.

Method of roasting cels .- Having skinned and calves, and that one cow will do as much work as scarcely a tenth part of the hay housed, but what roast till they begin to crack and appear white at is more or less damaged. Owing to the exces- the bone. When taken up, send them to the tasively deluged state of the lands, many fields of ble with melted butter and lemon juice, which potatos are greatly injured, as the rain fell in such will make the best sauce for them. They may abundance, that the ditches could not earry it off be fried or boiled thus seasoned, with very good

BOSTON, FRIDAY, AUGUST 22, 1828.

EXTIRPATING CHICCORY, or SUCCORY.

A correspondent wishes us to "publish the best great deal this season.

as a valuable plant for cultivation. But every plant which grows where it is not wanted, is, in a relative sense of the word, a weed.

Weeds may be divided into annuals, biennials, and perennials, or weeds which will endure onc, had the ill-luck to be crooked, was narrow enough perennial weeds, such as couch-grass, charlock, colts-foot, white-weed, and we believe chiccory, their destruction can only be effected by repeated ploughing, harrowing, and extracting the roots made, that opposite neighbors may shake hands from the soil, and either burning, or exposing without stirring from home. Then for uniformi, them in such a manner as to ensure their destructy of building-yours looks as if they were raised tion. We have, however, but little personal acin a general insurrection. Here stands one that quaintance with this chiccory, either in its capacaims to a palace, and next to it another that pro- ity of an useful plant or a pernicious weed; but fesses to be a hovel. Here a giant, there a dwarf, should be much obliged to any friend or correspeudent for information on the subject.

SILK.

Extract of a letter to the Editor of the New England Farmer, dated Rochester, N. Y. Aug. 12, 1828.

Last year I commenced on a small scale the rearing of the silk worm, and have produced some beautiful specimens of silk; they do well in this country. I have now a nursery of about 2000 for the raising of silk worms. The pamphlet on this subject, published by our government last crastination is of serious consequence to gardenwinter, should be in the hands of every farmer ing; and neglect of times and seasons will be and friend to the country, it is plain and practical. fruitful of disappointment and complaint. It will well-we have a soil peculiarly adapted to it.

COW TEAM.

An intelligent gentleman at Geneva, Switzer-

washed some of the finest large eels, cut them an ox of equal size. He however, allows that the in three, four, or five pieces, according to their diminution of milk and labor may be one fourth, ant of all rural affairs, has, during the past month, lengths. Make a seasoning of grated nutmeg, but still eight working cows would perform the pepper, and salt, with a little thyme, sage, and labor of six oxen, and at the same time give as the oldest farmer in all the country. Hay making lemon peel, all well beaten and mixed plentifully much milk as six cows that did not work—which began as early as the 5th of the month, at which with crumbs of bread. Strew this well on the would, in a year, amount to a considerable saving time the weather broke, so that we had hardly eels, stick them across on skewers, tie the skewers to the poor farmer. An elaborate article on this two dry days together at a time, and there is to the spit, baste them continually, and let them subject will be found in the New England Farmer, vol. iii. page 326.

FRENCH MODE OF TAKING INONEY.

The following easy method of taking honey, without destroying the bees, is the method generally adopted throughout France. In the dusk of the evening, when the bees are quietly lodged, approach the live and turn it very gently over; having steadily placed it in a small pit, previously dug to receive it, with its hottom uppermost, cover it with a clean new hive, which has been previously prepared, with two small sticks stuck across its middle, and rubbed with some aromatic mode of exterminating succory which prevails a herbs. Having carefully adjusted the mouth of each hive with the other, so that no aperture re-Chiccory has been highly recommended by mains between them, take a small stick, and beat agricultural writers, both in Europe and America, gently round the sides of the lower bive for ten minutes or a quarter of an hour, in which time the bees will leave their cells in the lower hive, ascend and adhere to the upper one. Then gently lift the new hive with its tenants, and place it on the stand from whence the other hive was taktwo, or more years without being renewed from en. This should be some time in the week prethe seed. All annuals and biennials are effectual- ceding midsummer day, that the bees may have ly destroyed by cutting or mowing the plant, at time before the summer flowers are faded, to lay any point below that from which the seed leaves in a new stock of honey, which they will not fail originated, in proper season to prevent the seeds to do, for their subsistence through the winter .greater engines carts, were invented. O, the good from becoming so far matured that they will As many as have the humanity and good sense to ly landscape of Old fish-street! which had it not grow when lodged in the soil. With regard to adopt this practice, will find their reward in an increase of their stock and their valuable property.

TRANSFUSION.

Some successful experiments are now making, by a gentleman in Herefordshire, with the view of preserving fruit trees from decay, by planting young trees in the vicinity, and transfusing the sap of the young plants through the bark of the decaying tree, and thus uniting the circulation of both.

The Editor of the Wilmington (N. C.) Reporter, states that he has seen a water melon, a present to a gentleman of that town, which weighed 414. lbs. measuring in circumference one way 3 feet 4 inches, and the other 3 fect 7 inches.

GARDENING.

The management of a garden, summarily speaking, consists in attention and application; white mulberry trees. From all the information the first should be of that useful and provident I can obtain, either by observation or otherwise, kind, as not only to do well in the present, but I believe that this section of country will prove for the future; and the latter should be of that fully equal to any other, (either Italy or France) diligent nature as willingly "never to defer that till temerrow which may be done today." Pro-The grape vine also flourishes here and promises often happen, indeed, that a gardener cannot do what he would; but if he does not do what he can, he will be most justly blamed, and perhaps censured by none more than by himself.

Weeding in time is a material thing in culture, land, proposes to substitute the labor of cows for and stirring the ground about plants, as also that of oxen and horses; and he maintains that it earthing up where necessary, must be attended would increase both the quantity of milk and the to. Breaking the surface will keep the soil in

health; for when it lies in a hard or bound state, enriching showers run off, and the salutary air cannot enter. Weeds exhaust the strength of the soundness of the lungs. The patient is directthe ground, and if they are suffered to seed and ed to draw in a full breath, and then begin to sow themselves, may be truly called GARDEN SINS. The hand and hoe are instruments for the pur- out again drawing his breath. The number of pose. Digging where the spade can go, between seconds he can continue counting is then to be the rows of plants, is a good method of destroy- carefully noted. In confirmed consumption, the ing weeds: and as it cuts off the straggling fibres of the roots, they strike afresh in numerous new shoots, and are thus strengthened. Deep hocing from nine to fourteen seconds. But when the is a good practice, as it gives a degree of fertility lungs are sound, the time will range as high as to the earth.

MANURE.

Manure is the great sinew of agriculture, as money is of war; and the making the best of every advantage or opportunity for increasing the quantity of it, is one of the most prominent traits in the character of a GOOD FARMER.

Amongst the stock of poultry, in the farm-yard near Swine, is a hen of a most aspiring character. Last year, preparatory to incubation, she was accustomed to ascend a lofty tree, and, having laid a number of eggs in an old crow's nest, succeeded in producing a young brood in that elevated station. The chickens were got down by means of a ladder, and reared in safety. In the present summer the same hen climed up another tree, and laid her eggs (also in a crow's nest) in a situation wholly inaccessible. She hatched her offspring; but, as it was impossible to rear a ladder to the height, the chickens, on attempting to quit the nest, fell to the ground and were all killed .-Hull Packet.

R. Rush, Esq. Secretary of the Treasury, has advertised that the Revolutionary Claimants will be paid their half-yearly pensions, agreeably to the late act of Congress, on and after the 3d of Sep-

Prodigious .- We understand that the steamboat North America left New York on Saturday for this city, with 500 passengers; and after all intermediate stoppages and changes, actually landed 380 on her arrival at this place .- Albany Chr.

Two signs were once opposite each other, at Philadelphia - thus inscribed - " James Shott" and " Jonathan Fell."

The work shops in the State Prison were lately burnt. The fire was discovered about the time the convicts were returning to their cells and is supposed to have been communicated by some of

Fire. - A small wooden box filled with saw dust in an office near Harper's Ferry, where no spark had been used for many days, was found to have taken fire near the bottom, the saw dust in the upper part was untouched.

Blackstone Canal .- The weather during a few weeks past has been favorable for the work of the Canal. It is confidently expected that the whole will be rendered uavigable by the day fixed for the Annual Agricultural Festival.

Cure for the Dysentery .- It is probably not so "Cure for the Dysentery,—It is proposity not so the foot's fine frowter, at 25 to 50 cts, per pount—not—sugererally known as it should be, that boiled milk, thickened with flour, and taken in the first stages of dysentery, is, in all common cases, an invaluable remedy. Boiled milk without flour is too for she at the Dysont Powder Store, No. 65 Broad street—by E. COPELAND, Jr. 27 The Du Pout sold as above, is warranted first quality—and is marked "E. Copedad, jr. Boston," on the head of the March 14 Mar

Soundness of the lungs .- Dr. Lyons, of Edinburgh proposes an ingenious and practical test for trying count as far as he can, slowly and audibly, withtime does not exceed eight, and is often less than six seconds. In pleurisy and pneuroonia it ranges from twenty to thirty-five seconds.

It is delightful to see savages becoming civilized; but it is deeply disgraceful and afflicting to see civilized persons becoming savage.

IF Serveral Communications are on hand.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Soods—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Onion. Strasburg do. - Robinson, Esq. of Benningholme Grange,
Silver skin do. Prickly Spinach and Dutch Cole for early greens
- various kinds of lettnee, carrot, cucumber, cabbages, &c.black Spanish or winter radish, &c. all warranted fresh.

Orchard Grass Seed -- growth of 1828.

Just received at the New England Farmer Seed Store, No. 2 North Market Street,

20 bushels of prime Orchard Grass Seed, raised, this season, with the greatest care, by John Prince Esq.—warranted to be equal in purity to any ever offered for sale in New England. A supply of pore Gilman Wheat, raised by Payson Williams and Mr. Wuchester, is daily expected.

Wild Geese.

For sale, five pairs of Wild Geese, two pairs three years old maire of the subscriber.

BENJ. J. PHILLIPS. Inquire of the subscriber. Lynn, August 16, 1823.

For Sale,

A Bull Calf five weeks old of the Short Horn breed, from the best Imported Stock, both Sire and Dam, well known and highly approved. Apply at this Office for price and particulars of pedigree. August 20, 1828.

Farmer Wanted.

An int-fligent, capable man is wanted to take charge of a Farm a few noises from the city. He must be able to produce un-doubted references, as to his knowledge of the besiness, habits of industry, &c. With one having the requisite qualifications an arrangement might be made for taking the farm on shares.

FOR SALE, An excellent Mare with her Colt, by the celebrated Horse Bell-An excellent Mare with new out, my new construction for in-founder. Also, a Bull, two years old, by Dention—perfectly kind and good tempered. Likewise, one full blood Merino Ram, one Ewe, and one Lamb. Apply at the office of the N. E. Farmer.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be firmished with boxes of Seeds, assorted, suitable for that market, at from \$1 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of "toston—for which a fair price will be given. Address "P. D." Beston brough the post-office.

61 Aug. 1

Out Meal, Out Flour, Grotts, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 berrels of fresh Oat Meal, fine holted Oat Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or re-tail. Also a few cannisters of fine Out Flour, neatly packed, at 50 ets. per cennister.

Gunpowder, &c.

Du Pont's Gun Powder, at 23 to 50 cts. per pound-Shot-Ba3s

MISCELLANIES.

From the Berkshire American.

MILITIA SYSTEM.

Our Militia System, (says the accomplished Editor) is every day treated with less and less respect. It is attacked in the pulpit-lashed by the press-scouted by wags-hated by farmers-execrated by the mechanics, and treated with rudeness even by the soldiers themselves. In short, it finds little quarter except with idle boys, romping girls, and members of the Legislature. Not long ago the following conversation took place between Colonel Cantecuzena, a member of the Legislature and Corporal Calabash-both officers of the Massachusetts militia.

Col .-- Well, friend Calabash, you've got a ris-

as the militia system is falling, I may soon get to

Col.-Get to the top !-what do you mean you ungraceless reprobate? You don't calculate, to mount over the heads of colonels, and majors, and the like, and get to the top without passing thro' the regular gradations of office.

Corp .- I had no idea of mounting at all; I was only thinking of waiting till the system come down

Col.-Eh?-Then you will wait one while, by gorry-and you may as well hang up your whistle as to think of rising like a Ponnx, on the ashes of our glorious and unparalysed militia system.

Corp .- It is not altogether unparalysed, colonel; on the contrary, it has met with some pretty smart shocks, that have benumbed and crippled it most severely. It is with great difficulty it can make a shift to stand, by the help of the Legislature.

Col.-Harkee, corporal Calabash, I belong to that honorable body, and I advise you not to cast none of your slurs and back-handed illusions upon the corroborated wisdom of the State, or possibly you may be brought up for attempt of court.

Corp. - I have been brought up by an attempt of court too often, and compelled to march half a day with a gun on my shoulder, a mere spectacle for boys-and all to gratify your Legislative wisthe age.

start mad-as mad as a March mare. We should buffoons, for idle boys to stare at, and never will have fine times, indeed, if our laws did'nt compel the poor people to protect the property of the rich. But burden than they. I cannot believe the people are in airnest about overthrowing our glorious and matchless militia system.

Corp .- Never boast of its being matchless, colonel, for public opinion is preparing a match for it that will be apt to blow it sky high, sir,

Col .- Is it so near its end then, Calabash?

Corp .- It is even so. It has been trembling for some years, and now only survives to excite ridicule and repreach.

Col .- Well, if it must go, I'll fight for it till all is blue. Ay, sir, I'll stick to it to the last, as Lonidas did with his three hundred Spaniards at the standing. It is now well known, that the outer, Straits of Tremoppily ;-I'll never, never give up the ship, by gorry.

your mettle.

real military sperit. I am astonished to find a pro. individuel. It is only when the medullary, or in- time of subcribing, are entitled to a deduction of fifty cents.

mising young officer like you, a corporal, enlisted nermost portion of the brain, is compressed or inagainst the militia system.

Corp .- I am a promising fellow, it is true; and as a proof of it, I promise you on the word of a mentioned, that I pray heaven your epaulettes may cling to your shoulders, and your sword to your side, as long as the State continues in petticoats, and is pleased with mere military play-things.

Col.-Though I spoke about sticking to the system, I had no idear of holding on to my commission forever. No, I calculate soon to resign my epaulettes and other bags of distinction, having already spent a good thousand dellars in supporting them honorably.

Corp. - Indeed! It is vastly tempting for a corget honor enough to come to a thousand dollars! But I take it militia honors will be less expensive before many years. The people are wide awake, and fully resolved to get rid of so useless a burden. Col .- How do they calculate to get red of it,

Mr. Corporal?

Corp .- By getting the law repealed. Col.-Exactly so. But harkee, Calabash, that is not so easy a matter as some people imagine. I belong to the Legislater, and while I have a seat there, I'll do my best to keep up the old militia system.

Corp .- Uncqual and burdensome as it is!

Col.-1 don't care a snap for that; I've spent a thousand dollars in its support, and-

Corp.-Never benefitted the country a thousand mills-I beg pardon for interrupting you, colonel.

Col.-Whether I've benefitted the country or not, I leave to my constickuents to judge. But one thing I know, I've spent my money, and I'm determined others shall spend their'n in the same

Corp .- A noble principle that !- and worthy of a Legislator!!

Col. - Worthy, or unworthy, sir, it is the principle of a majority of the Legislater-of that honorable body, who are two thirds of them past and present militia officers, such as generals, colonels, that hitter almonds cause sleep, and create appedom, which is more lame than justice herself, and majors, &c. all of whom have spent a great deal tite. They were considered as a cure for chilcomes limping along a mile behind the sense of of money in brushing up their regimentals, and polishing their weepons, and wetting their com-Col .- The age has no sense-the people are missions, and wish to strut about like so many consent that others shall come off with a lighter

> Corp.-Well, if the Legislature is composed of such men, it is time they had leave to stay at home, and the noncommissioned officers and privates will be apt to reserve the right of command, and say to them, at the ballot boxes-"to the right about face! March! You're dismissed!"

Loss of brains .- The present Duke of Manchester met with an accident, by which a piece of his skull was kicked away by a horse, with a portion of the brain also; and yet his Grace has made a very excellent Governor of a colony notwithor, as it is called, the cortical part of the brain, is entirely devoid of feeling when in a natural and Corp.—Bravo! coloncl. I like to see a man of healthy state; and that any portion of it may be lost by accident, (as in this instance) or by disease, Col.-Ay, sir-I hope I am not wanting in the without any inteference with the intellect of the

jured, that life and intellect are affected.

Except thou desire to hasten thine end, take corporal, that I have very little ambition for the this for a general rule; that thou never add any honor and glory of a militia officer. So far from artificial heat to thy body by wine or spice, until wishing to mount over your head, as you just now thou find that time hath decayed thy natural heat, and the sooner thou beginnest to help Nature, the sooner she will forsake thee, and leave thee altogether to Art .- Sir. W. Ralegh.

Vegetable Resuscitation .- A very old mulberry tree was shattered in pieces by a storm of wind in 1790; afterwards, an elder tree, which grew, without doubt, from berries that had fallen into the heart of the old mulberry trunk, usurped its place; this elder tree died in 1826, and then-36 years after the destruction of their parent stem-Corp. - Why, yes sir - rather on the rise; and poral to persevere in the path of promotion! - to about a dozen of mulberry shoots started forth to the light of day.

> Many people say ripe fruit is always wholesome. But it is injurious to eat to excess even of good; beside, proportions of different kinds of food are required. Fruit has very different properties, whatever those properties are, good or bad, they are most powerful when the fruit is ripe.

Numerous Swiss emigrants remained at Havre when the Olympian sailed, waiting a passage to the United States. All the American vessels there could have a full compliment. We are informed some months since, that from eight to ten thousand were arranging to emigrate, principally from the Canton of Bern.

Bitter Almonds .- These were considered by the ancients as of use to alleviate the evils of drunkenness. Plutarch relates that Drusus' physician. (who was a great drinker) took at every cup five bitter almonds, to allay the heat and fumes of the wine. Bitter almonds are held aperient, detersive and diuretic; they are therefore recommended in obstructions of the liver, spleen, &c. Pliny states, that a decoction of the roots of the bitter almondtree supples the skin, prevents wrinkles, and gives a fresh, cheerful color to the countenance; and blains, as well as the bite of a mad dog.

AGRICULTURE. FOR THE NEW ENGLAND PARISER,

HAY-FODDER.

MR FESSENDEN - As the mowing season draws to a close, it becomes a matter of regret, that the result is likely to disappoint the early expectations of a great abundance. It is a fact, that in general the barns are filled, and that many small stacks make their appearance in the yards, but the quality ought to be considered as well as the quantity; and there is no doubt but a considerable proportion of the English hay got in this seasou, has been greatly injured in the making, by the continual showers, and that there is but a small portion of the general crop, which can be esteemed of a first rate quality; even the best is inferior the hay raised in common scasons; having less substantial and nutritious, and will not go so far in feeding entry cattle or horses. In regard to the produce of the pleadows, it is very materially injured; even the most layed lots have suffered greatly from a superabundance of water, which has ehecked the growth of better grasses, and encouraged that of the course broad grass, which when dried is hardly fit for any purpose but that of a poor litter. The lower meadows have been so long under water, that the best grasses have perished, and where in good seasons the eye is delighted to contemplate a thick and a complete annihilation of all the host of canker rich mixture of pipes, yellow weed, blue and eel. and other valuable grasses, nothing at present is seeu but a dreary waste, the swarth being laid down and in a state of decay. It is probable that the most of it will not be thought worthy of the labour of mowing, poling and bringing to the

All these matters duly taken into consideration. the hay produce of this year, will be found, I apprehend, not to exceed an average erop; yet the impression of a great abundance is gone abroad, and has brought down the market to an unaecountable state of depression. If we consider that the exuberent vegetation of this season, has been owing to an unusual quautity of rain, aided by heat, and by frequent thunder, (electricity), we must acknowledge it to be the result of powerful stimulants, which after their effect is over, will leave the swarth in an exhausted state, threatening great sterility, the first coming season of a dry, or otherwise unfavorable nature. The reflecting, experienced farmer, will see, therefore, that although the precise time is hidden, that "the lean kine are coming; and he will prepare accordingly. Under that impression it would seem, that, although much degraded, the produce of all meadows unmowed yet, may be, it ought to be, gathered and secured. A good salting will give some relish to poor fodder. It would assist to save the English hay for a hetter market, and towards the coming time of need, where barn room is wanting, the hint given in your paper of the 8th inst. and subscribed "Dorchester," is well deserving

The time for cutting the stalks of Indian corn is near at hand, and I shall improve this opportunity to point out a manuer of curing them, prac-

After cutting them by fair by experiment. weather, they should be gathered the next or following day, tied in small bundles at the upper end, and set immediately, not too close, on poles fixed in the barn across the beams, taking care to have the doors opened in the day time, that they may dry and season. In January those which remain, ought to be taken down and packed close together, to prevent their getting too dry. usual method of making small stacks of them round the fields, exposed for weeks to the wind, the dew, and the rain, is a dreadful waste of this article, which if eured as above, makes a sweet and excellent fodder.

With much esteem, I am your friend, &c. Weston, August 26, 1828. J. M. G.

FOR THE NEW ENGLAND FARMER.

CANKER WORMS.

Mr Fessenben-I observed in my last Friday's paper a communication from W. of Lynn, dated August 5th, 1828, stating that the orchards magnitude; the smut cars being comparatively trees, but none have been successful except tarring. No doubt the writer is correct as relates to tarring. But if this mode of warfare should prove corms in an orchard, yet the campaign would be so long and tedious that I should attempt to take the castle by storm. I would not disturb the caterpillars till the leaves were cut; and when they ly from your trees, and are technically called commenced their depredations, and were feasting windfalls, and boil them for your swice, bury them on the green leaves, I would come upon them as a little this side of the centre of gravity, or so king of Babylon and his nobles, when they were contain; otherwise the plague of wormy fruit banqueting together. My mode of attack would will, for aught that I know to the contrary, be enhe to take some rye straw, in a calm time, after tailed on you and your heirs for aye. Your hogs scatter some sulphur, or roll brimstone powdered, sufficit of it as a medicine to neutralize the acid amongst the straw. Then scatter a little fire of their stomachs, and you have only to place it amongst these combustibles; and my word for it, where they can get at it, and every hog will be the Pacha of Egypt when he beheld the ruins of mitted to ferment till it has a sweetish taste, but their hold, and become an easy prey to the de-edly sour. You may as well have a hole in your vouring element.

FOR THE NEW ENGLAND FARMER

SMUT IN INDIAN CORN.

Ma FESSENDEN-The fields of corn in this region perhaps never looked more promising than at the present period, with one exception only .-That is the unusual quantity of smut ears; and no one is in possession of any knowledge how to prevent this evil. Should you be in possession of any method to prevent smut, and would be pleased to make it known through the edium of your very useful paper, you would confer a very great favour on a Subscriber.

South Sandwich, Aug, 19, 1828.

Remarks by the Editor .- We have never observed a crop of Indian corn, which was not in some degree affected with what are commonly called "smut ears." The evil, however, has not, so far as our notices have extended, proved of much in that town had, for several years, been infested few in number, and easily separated in husking with the canker-worm, and that every expedient from the sound corn. We should be much oblighad been resorted to for the preservation of the ed to the cultivator, who would give us further information relative to this disease in one of our most valuable vegetables, and its remedy, if any has been discovered.

ORNAMENTAL TREES.

This is emphatically the season for realizing the importance, the convenience, comfort, and beauty of shades. Who that has been sheltered from the influence of a torrid sky, and has reposed in the coolness of umbrageous walks in this hot month, will grudge a little expense and labour during Spring and Antumn in augmenting the number of ornamental trees? The public squares and private enclosures of the city have been greatly improved in this respect within a few eye, or more conducive to health, than the quantity and freshness of foliage which in many places from the glare of a summer sun.

If this is the season to remind us of the imthe kinds in our view most worthy of propagation, as well from ease of culture, as on account weeping willow. Some of its characteristics are drawn in the subjoined extract from a work lately published by a practical horticulturist. To the associations of the beautiful tree, the author might have added the allusion to it in that pathetic and 137th Psalm;

. By the rivers of Bahylon, there we sat down; thereof."

From Prince's Treatise on Horticulture.

Salix Bubylonica, or Weeping Willow .- This is more disseminated in our country than any other exotic species, and may be considered as the most ornamental of the whole number. It is partial to a moist situation, and is said to be a native of the banks of the Euphrates, whence its specific title. It. however, flourishes in almost any situation, spreading its roots to a great distance in the earth, and extracting, by their wide extension, the necessary sustenance for a lofty developement. It will attain to the height of from forty to fifty feet, or more, forming a fine, majestic and spreading head, with its long pendulous branches gracefully drooping on all sides; and this tree is calculated, when standing distinct, to form, by its fine outline and peculiar elegance, one of the most pleasing variations in ornamental pleasure grounds. Its growth is very rapid, and it consequently soon becomes of a size to afford shade and ornament. It is said, that in ancient times lovers' garlands were made of the wreaths of this tree, the branches of which are so slender and

quently selected as suitable for planting in burial grounds, or to mark the existence of insulated tombs; and a tree of this species now droops its parts of the United States in making hay, and in branches over the remains of that arbiter of em- others in curing corn blades, commonly called fodpires, Napoleon. He considers me bound at top by a rope made of the blades.—Tay-ORCHARD GRASS.

The following is the substance of a letter, written by a gentleman of Riehmond, Va. to a distinguished agriculturist of South Carolina, and published in the last number of the American Farm-

Union :-

Richmond, Va. August, 1828. Dear Sir-Yours of the Sth. ult. has been received, and I take pleasure in complying with your request in giving you my "views in relation to the hood, with my opinion as to those best adapted to mand. your soil and climate, and the probability of your

success in an attempt to grow them."

For the last eight or ten years both myself and my neighbors, many of whom are amongst the most scientific, practical and observant farmers in our state, have bestowed much attention and been at some expense in the selection and cultivation of those grasses generally esteemed the most valnable, and after a full and fair experiment of all such within our reach, we have been led to the conclusion that the orchard grass (Dactylis glomerata) combines more valuable properties and possesess superior advantages to any other. It is abont ten years since the orchard grass was introduced into my neighborhood, and the experience of every year increases our opinion of its value .-For your information I will now state some of the valuable properties which induce us to give it the preference to the other. The orchard grass grows rapidly and upon soils too much exhausted to bring clover, it resists the hoof and the tooth and hears the frosts of our winters and drought of our summers better than any other; from this circumstance it affords the earliest and latest pasturage: it is amongst the most nutritious food for fattening cattle and for milch cows; for sheep affords an abundant bite throughout the winter; indeed I have for several years past supported my flock of sheep upon it exclusively, never giving them a mouthful of any other food, except when a fall of snow rendered it inaccessible to them. as you could desire to see; this grass possesses the remarkable peculiarity, that it does not, like the second growth of every other grass, cause that horses and other stocks; for land intended for timothy, and I believe every other grass require to (as farmers say) run out. Nearly thirty years aof the village for a number of years; the proprietor again took the management of the property, a few years ago, and without sowing a grain of seed, president of the Philadelphia Agricultural Society) permit, I would refer you to several communica- in adversity, and the best provision in old age.

TO SAVE ORCHARD GRASS SEED.

When the head has a whitish cast, and when there any of so light a description in my neighbor- shook, the seed drops, cut it with the sickle or hood; but it is now cultivated on the eastern cradle, lifting the grips out of the cradle; handle shore of this state, the soil of which I should sup- grips or swarths as little as possible; therefore, pose very much to resemble yours; it is also cul- neither bind them or shock them, but let them be tivated by a friend of mine on James River, Va. gently gathered and carried into the barn floor in whose soil and sub-soil answers precisely to the a sheet, by hand, or in a cart on sheets spread in description given of yours; he finds it to thrive the bottom of the cart; heat it out by grips, by well and thinks it a most valuable grass. From a striking the grips against any instrument; for infact of its resisting the parching droughts of our stance, a narrow plank, fastened either perpendicsummers, which for the last 6 or 8 years have ularly or horizontally, or by any other contrivalmost invariably destroyed our clover and other ance; four strokes, generally, will take out all the grasses, I can hardly have a doubt of its proving seed without the chaff; riddle it; the seed will a most important acquisition to your southern go through, the stalks, &c. will remain in the ridcountry; and the circumstance of its bearing so dle to be thrown away; lay down the beaten well the severity of our winters induces me to be- grips in a pile till you clean up the floor, with the lieve that in your climate it would remain in full butts even; bind them in sheaves, to be cut and verdure throughout the year. I have cut from it mixed with chop, bran, shorts, &c. for feed to two crops of hay in the same season, and with stock. By this process, the hay is not lost, which would be the case by threshing, instead of beating out the seed. Two men will clean 50 hush-

> A good teamster .- Mr. William Bradford has for three years and three months past, with a six horse team, freighted to Boston, for one Company in this village, (various kinds of country produce.) eighteen tons, fifteen hundred, two quarters and nine pounds-has freighted merchandize from Boston, one hundred and fifty-eight tons, eighteen hundred, and naneteen pounds; for which he has been paid in cash four thousand eight hundred and twenty dollars. He has with the same team and during the same time, freighted to and from Boston, for the Strafford Copperas Company and others, one hundred and eight tons, seven hundred, two quarters, and two pounds: making an aggregate of three hundred and forty-nine tons, one hundred and two pounds. This has all been done with six borses without changing, with the exception of two borses for the last three months, averaging seventeen trips per year. His time of arrival and departure has been as regular as the United States mail stage. What is very remarkable, during all this time he has not drank a drop of spirits, wine, cider, or strong beer : nor has he at any time moved his team on the Sabbath. - Montpelier, Vt. paper.

G ese-It is said that geese may be advantageously fed on turnips, cut in small pieces, similar to dice, but not not so large, and put into a trough of water.

Learning is an ornament in prosperity, a refuge

Directions for the Rearing of Silk Worms, and the Culture and fixed to upright posts—they may be multi- hold, or between the decks; and is it any wonof the White Mulberry Tree. Published by the Pennsylvan a Society associated for the Promotion of those Objects. Philadelphia. 1828.

The above is the title of a pamphlet which we lately received by the kindness of Dr. Mease. It appears to us to be very well calculated for the uses implied by its title, and we shall therefore proceed to place before our rea ers such portions of its contents as point most painly to such processes as are indispensable to success in the manufacture of silk.

Procure eggs in February and March, and choose those of a pale slate or clay colour; avoid all which are yellow, as they are imperfect. Keep them in a cold, dry place, (where water will, however, not freeze,) until the leaf buds of the mulberry begin to swell. If the eggs be soiled, dip the paper or cloth to which they adhere, in water once or twice, to wash off the coat with which they are covered, and which will impede the hatching of the worms.* Dry them quickly in a draught of air, and put them in one or more shallow boxes, lined with paper; which place, if possible, in a small room, of the temperature of 64°, and keep it up to that degree for the two first days, by means of a fire in the chimney, or still better, in a brick, tile, or porcelain stove; or for want of these, in an iron stove; and use tanners' waste bark, turf, or charcoal for fuel, to promote and keep up a regular heat day and night. The third day increase the heat to 66°, the fourth to 68°, the fifth to 71°, the sixth to 73°, the seventh to 75°, the eighth to 77°, the ninth to 80°, the tenth, eleventh and twelfth to \$2°. It is impos- may be well preserved in an ice-house. An Engsible to expect regularity in hatching, if reliance lish journal recommends the use of dry pit sand be placed upon our variable weather; and it is the regularity of the worms coming forth, which will insure their uniform growth, save much trouble in feeding and attending those of various ages, then placed in the bottom of the jar; above this I can affirm this to be a mistake. Apples, after and cause the whole or the greater part, to form a layer of fruit, to be covered with a layer of their cocoons at the same time, provided proper sand an inch thick; then lay a second stratum of frost will admit, should be taken directly from the care be given during their progress.

worm is formed: cover the eggs with white pa- uppermost row of fruit. The jar is now to be per, (never use a newspaper,) pierced full of holes closed, and placed in a dry situation, as cool as the size of a large knitting needle; the worms, possible, but entirely free from frost. Some aswhen hatched, will creep through them; turn up sert that apples may be kept in casks through the be, the putting them in dry sand as soon as pickthe edges of the paper to prevent their erawling winter, in a chamber or garret, by being merely ed. For this purpose, I dry sand in the heat of off. Lay twigs of the mulberry, having two or covered with linen cloths. Apples, which are in-summer, and late in October put down the apples three dry and young leaves, on the paper, to col- tended for winter's use, should be suffered to in layers, with a covering of sand upon each laylect the worms, and more as they continue to hang on the tree as long as they are safe from er. The singular advantages of this mode of mount. For want of mulberry leaves, feed for a frost. short time upon lettuce leaves, perfectly dry; if large, they should be cut in strips, and the mid-rib thrown away: or still better, feed with the twigs of the white mulberry tree, cut up fine. The worms first hatched are the strongest : nevertheless, if only a few come out on the first day, give them away, to save trouble, and depend upon those which appear on the second and third days. Give away also the produce of the fourth day, and then the whole stock will go on regularly. If it be wished to rear all that are hatched, endeavour to keep the produce of each day separate, by numbering the boxes and shelves. When the leaves on the twigs are loaded with worms, they are to be gently placed on clean stout white paper, laid on frames with crossed rattans, giving them a plenty of room. The shelves over which these frames should slide, may be four feet square,

Boil it to a proper conthey will then drop without injury to the buds .-Poles should never be used but with a hook at the end, covered with cloth or matts to prevent wounding the bark; they then serve to shake the small limbs. Particular attention is required in gathering winter fruit. They should be taken in the hand, the fingers placed at the foot stalk, and, by bending it upwards, the fruit is gathered with case, and without injury; they should be moved from the gathering baskets with great care," &c. The same writer says, "The injudicious method its consequences, than is generally understood; the blessom buds of the succeeding year are placed at the side of the foot stalk of the fruit, and if the spurs are broken, no fruit on that part will be produced."-See further, Fauit.

Use .- For pies, tarts, sauces, and the dessert, description. In France, bread is made consisting the summer complaints of children, the dysentery, of one third of boiled apple pulp, baked with two thirds flour, properly fermented with yeast for twelve hours. This bread is said to be very fine, full of eyes, and extremely palatable and light .-Apples, by furnishing cider, a grateful and salubrious liquor, have a tendency to diminish the consumption of ardent spirits. Besides, apples are thought to alter and ameliorate the taste and the tone of the human system, in such a manner as to destroy that artificial appetite, which is gratified by the deleterious preparations of alcohol .-"The palate," says Mr Knight, a celebrated English horticulturist, " which relishes fruit, is seldom pleased with strong fermented liquors; and as feeble causes, continually acting, ultimately produce extensive effects, the supplying the public base is brought to mind by the sight of its lofty with fruit at a cheap rate, would have a tendency summit. The appearance of the Shelton oak, to operate favourably, both on the physical and hollow throughout its trunk, and with a cavity moral health of the people." In medicine, verinice, or the juice of crab-apples, is used for score of persons, sufficiently denotes its antiquity. sprains, and as an astringent and repellent. The Tradition informs us that just before the famous good table apple, when ripe, is laxative; the juice battle of Shrewsbury, June 12, 1403, headed on is useful in dysenteries; boiled or roasted apples one side by Henry Percy, surnamed Hotspur, Owen fortify a weak stomach. "Scopoli," says Loudon, Glendower, the powerful Welch chieftain, and the "recovered from a weakness of the stomach and firm adherent of the English insurgents, ascended "such as catarrhs, coughs, consumptions, &c. they are of considerable service. For these bencaten raw, but either roasted, stewed, or boiled. They may also be usefully employed in decoctions, which, if drank plentifully, tend to ahate febrile heat, as well as to relieve painful strictures in pectoral complaints."

for horses and farm stock, for which purpose the neighborhood, in the reign of Henry III., prosweet apples are of the greatest vaine .- See N. bably deriving them from Waring, son of Athlet, E. Farmer, vol. v. p. 82. Sweet apples are said; a Saxon, who had land in the market place of the apples are ground and pressed in a cider mill, ing paper, subscribed, "per me Adam, Waring,"

apples, and remove the core completely. Then one hundred and forty years of the battle of Shrews of salt have been dissolved are poured through

sistence, skimming just before it begins to boil.

BENEP LANT, (Sesamum Orientale.)

Mr Editor-The mucilage obtained from the leaves of this plant has proved very beneficial in some of the middle States, in the summer complaints of children, and was administered successfully last season to upwards of two hundred persons at the Pavilion. The seeds of the Bene or Sesamum are a great article of food in Egypt and the East, and furnish an oil said to be superior to practised in gathering fruit, is more destructive in that of the olive. - The magic power of the word Sesame, will always be remembered by those who have read the Arabian Tales.

Doctor James Smith, of the Vaccine Institution, Baltimore, says, "one leaf of this plant immersed in a tumbler of spring water, changes it immediately into a fine mucilage, that is perfectly the use of the apple is too well known to require clear, tasteless and inodorous, and very useful in &c. Sick children take it as they would pure water, and as it is perfectly innocent, they may be allowed to take as much of it as they like."

The leaves of this rare and valuable plant may be obtained gratis at the PAVILION.

THE SHELTON OAK.

This stately tree stands on the road-side, where the Pool road diverges from that which leads to Oswestry, about a mile and a half from Shrewsbury; whose spires form a pleasing object in the distance; whilst above them, the famous mountain called the Wrekin, lifts its head, and inspires a thousand social recollections, as the well known toast that includes all friends around its ample towards the bottom, capable of containing half a indigestion from using them; and they are equal- this tree, and from its lofty branches, then most ly efficacious, in putrid and malignant fevers, with probably in the full pride of their vigor, reconnoithe juice of lemons or currants." "In diseases tered the state of the field; when finding the king of the breast," says Dr. Willich, (Dom. Ency.) was in great force, and that the Earl of Northumberland had not joined his son Henry, he descended from his leafy observatory with the prudent eficial purposes, however, they ought not to be resolution of declining the combat, and retreated with his followers to Oswestry.

The great age of the Shelton oak, thus pointed out by the tradition which connects it with the name of Glendower, is likewise attested by legal documents belonging to Richard H. Waring, Esq. Apples have also been recommended as food whose ancestors possessed lands in Shelton and

rections on this subject :-- "The general method put them into a pot, and place it in a heated oven, bury, and an object of remark to old people long of gathering apples for cider, is, shaking the tree, or over a slow fire. When well stewed, squeeze before that period. The circumference of this it is twenty-six feet.

From the American Farmer.

TO PREVENT THE DESTRUCTION OF BEES, BY THE BEE-MILLER.

Devan's Ferry, Bartie Co. N. C. July 8, 1828.

Ma Skinner. - Understanding that you are the publisher of a paper exclusively devoted to domestic industry and intelligence, and through which every subject upon domestic economy can be, and is readily communicated to the public: I take the liberty, through the advice of a friend, of making known to you, fer publication, (should you thin's proper to publish the same,) my method of preventing the destruction of that useful insect, the Bee, by what is usually called the Bee-miller, or Bec-worm.

I have, sir, for many years, been the raiser of bees, and was at one time much troubled with the bee-worm; but, upon examination, I found they always bred between the bench upon which the hive sat and the bottom edges of the hive. I first adopted the method of having the bottom edges of the hive brought to so small a point or edge as to afford them no shelter; but now, during the warm season, I raise the lave by placing small sticks around under the hive, so as to raise it. say about half an inch from the beach, which I take out during winter or the cold mentlis.

And I can say, sir, that for many years I have seen nothing of the bec-worm, and that my stock of bees have increased as fast as I can or could Yours, &c.

MILEY HAMILTON.

BARM, OR YEAST.

Dr Townson, in his "Travels in Hungary," gives the following recipe for making a ferment, which may be used as a substitute for yeast in the composition of bread.

"The ferment is thus made: Two good handfuls of hops are boiled in four quarts of water; this is poured upon as much wheaten bran as can be well moistened by it; to this are added four or five pounds of leaven; when this is only warm, the mass is well worked together to mix the different parts. This mass is then put into a warm place for twenty-four hours, and after that it is dia vided into two small pieces about the size of a hen's egg or a small orange, which are dried by being placed upon a hoard and exposed to a dry air, but not to the sun: when dry they are laid! by for use, and may he kept half a year. This is the ferment, and it is to be used in the following manner; for a baking of six large loaves, six good handfuls of these balls are taken and dissolved inseven or eight quarts of warm water. This is poured through a sieve into one end of the bread trough, and three quarts more of warm water are poured through the sieve after it, and what remains in the sieve is well pressed out: this liquor likewise, to afford a saccharine matter, which is a Shrowsbury before the use of dates was known, is mixed up with so much flour as to form a mass good substitute for molasses. For this purpose Among this gentleman's title-deeds is the follow of the size of a large loaf: this is strewed over with flour, the sieve with its contents is put upon and the juice boiled immediately, the seum being taken off till it is reduced to a proper consistence.

The following process for making apple jelly script]. This extract will suffice to prove that begun to crack; this forms the leaven. Then fifhas been recommended :-- Pare and quarter the the Shelton oak was esteemed a great one within teen quarts of warm water, in which six handfuls

the sieve upon it, and the necessary quantity of declare the premiums which had been awarded about an hour. It is then formed into loaves, soon to present to our readers .- Patriot. which are kept in a warm room half an hour; and after that they are put into the oven, where they remain two or three hours according to the size. The great advantage of this ferment is, that it may be made in great quantities at a time, and kept for use."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 29, 1828.

Extract of a letter to the Editor of the New England Farmer from a gentleman, who has been advantageously known to the American public by several useful works on scientific subjects.

TREATISE ON BEES.

Dear Sia,—Since I had the pleasure of seeing a monsters do not propagate." you last, I have made considerable progress in the investigation of the subject of bees. By the help of reading, correspondence, and my own observation, I shall (I think) be able in a few months to produce a small work entitled "A Practical Trealise on the Management of Bees, and the Establishment of Apiaries. &c." Such a work in a cheap form is very much wanted in our country, and I am surprised that it has been so long neglected.

We fully coincide with the writer of the above, that a treatise of the kind he proposes is much wanted; and we know of no person from whom a better work could be anticipated than what this gentleman has means and talents to enable him to produce .- Editor.

Yellow Locust .- The culture of this valuable tree has been recently prosecuted with great success in various parts of New England. A gentleman in Brunswick, Me. writes us as follows:--"The four ounces of Yellow Locust seed purchased at the New England Farmer office last autumn, has done finely, as well as all the other seeds purchased of you. I have now over 1000 Locust Trees from this seed, some four feet high, doing well on the sandy plains of Brunswick."

We are happy to learn that the Hon. Judge PITMAN has accepted the invitation to deliver an Address to the Rhode Island Agricultural Society at their next anniversary. - This Society has been distinguished for the excellence of its Addresses.

The Annual Cattle Show, Exhibition of Manufactures, and Ploughing Match, of the Worcester Agricultural Society, will be held in the town of cially selected for grafting or budding in the way Worcester; on Wednesday, the 8th of October.

EXHIBITION OF THE NEW ENGLAND SOCIETY.

On Tuesday last, notwithstanding the great heat of the weather, the Halls over the New Fan- almond, I raise several bushels, and will give you more beneficial to adhere to the same sorts of food euil Hall Market were thronged with visiters to what you may wish, if needed, for distribution witness the exhibition of manufactures under the hereafter. auspices of the New England Society. GRAFTING.

is wisely so ordered, by immutable, eternal laws, pearance of powdered wood) with a knife, and inthat the succession of beings of the same species sert a wire, sharpened, and bent into a small hook, is preserved separate and unmixed. Nothing un- and you will soon draw out this destroyer of trees, natural can be continued; or, in other words, even if he has penetrated a foot or more into the

As to many proposed experiments, as well as to some that are at present promising, it would be well to withhold too strong an expectation.

On the quance the pear is engrafted. This produces what is called the Dwarf. But of several and he will please to accept of our thanks for his hundred, I believe I may say, that I have import-communication. The use of a wire for the extired, I have scarcely one that promises anything, if, pation of insects of this description, has been bealive. The Borer is fond of, and fatal to them, so fore recommended by John Prince, Esq. of Roxmuch so, that almost all that have been imported, bury, see N. E. Farmer, vol. ii. page 342; also or propagated, have nearly disappeared before Deane's N. E. Farmer, page 363. In the New this veracious devourer.

So also as to the Thorn, I must think it a mistake that the pear thrives on this stock, I have in so many instances found the contrary effect to take place. In all cases, though, the pear grafts thrive for one, and at most two years, it is then too seantily supplied, and the grafts perish, apparently for want of nutriment.

I do not wish, however, to discourage a zeal, which if it fail in its main object, must yet in its progress do much probably to enlarge or fix the boundaries of knowledge. I am bound, too, to state one experiment, acquired in the very pathway of your correspondent, which will be new to some of your readers. About thirty years ago, I engrafted a number of apple trees with pear grafts. In most cases the graft projected on one side, and they did not generally unite so as to reone, however, which united well, and for fifteen hickory [white walnut] bark, of which one table or twenty years produced an abundance of fine spoonful may be given every hour through the day St. Michael pears as could be had. I have often to a child seven years old. surprised my friends when they praised the pears, by telling them they grew on an apple tree.

There are cases where stocks may be benefialluded to-say of the almond for the peach. So also some have taken for like use the plum stock.

present meddles with them.

THE BORER.

MR FESSENDEN-For several years I have been in the practice of destroying the bears in my apple, quince, and mountain ash troce, as recommended by a Committee of the Mass. Ag. Society. and published in Thacher's Orchardist, by the MR Fessenden—I have seen some remarks in free use of the Chiscl, though it has given me pain your papers as to grafting, which propose a wide to think no method had been devised to destroy course of experiment on this subject. There are the worm without greatly injuring the tree by the some singular instances of the support of vegeta- operation. I have at last discovered a way to exble life, by this process, which seem opposed to tract the borer, which is so natural, simple, and those general laws which have been supposed to expeditious, that I am astonished it has not been govern the vegetable kingdom. If we reason thought of before. It is this,—Open the bottom from analogy, as relates to the animal kingdom, it of the hole (which is easily discovered by the ap-

> Remarks by the Editor .- The notice of our respected correspondent, relative to his mode of destroying the Borer, will, no doubt, prove useful, England Farmer, vol. iv. page 382, is the following Editorial article :

" LOCUST TREE BORER.

A horticulturist tells us that he has preserved his Locust Trees against the borer which has almost annihilated that fine tree in this part of the country, by first probing the holes made in the tree by the insects with a small flexible wire, a little hooked or curved at the end introduced into the tree. With this he destroys or extracts as many of the worms as possible. He then with a small syringe, injects into their holes strong soap suds, which puts a finishing band to their destruc-

Remedy for Whooping Cough .- The following has been recommended for this complaint, which is now common :- Take equal portions of commend the practice. It was otherwise with new milk and the lye strained from the ashes of

POWER OF HABIT.

In regard to food, it is very certain that habit can raise us above the standard of ordinary men. "Meat and drink to which we are accustomed" says Hippocrates, "agree with us, though natural-The almond is very hardy, and no insect at ly permicious; but not those aliments to which we are unaccustomed, though naturally whole-It is otherwise with the plum of late. Of the some " and henceforth he concludes, that it is than to change them abruptly, even though we substitute better in their stead. Alexander the Great, when in India, found it necessary to forbid his army the use of wholesome food because it carried off the men, owing to their not being aceustomed to it. So true is the observation of Celsus, that "whatever is contrary to their habits,

Liban informs us that the Ethiopians eat scorpions, and Mercurialis states that the West Indians eat toads; neither of these facts is without a

parellel in Europe. At Padua and Rome there were two children who ate scorpions, and a girl took pleasure in eating frogs, lizards, serpents, mice, and all-sorts of insects. Another ate live lizards and scaterpillars with pepper and vinegar. Of spider eaters, who grew fat upon those disgusting insects, we could collect half a dozen instances from different writers. Galen relates of an old woman, that she had gradually habituated herself to make a meal of hemlock; and Sextus Empiricus assures us, that there have been persons who have taken thirty drams of that poison without injury. A student at Halle accustomed himself on purpose to arsenic, which he took with his food, from a boy; and though it at first occasioned vomning, yet in time he could bear a considerable quantity. Hence it is evident, how one who habituates himself needlessly to physic, breaks down the bridges which, in case of emergency, might carry him in safety over the abysses of discase .- New Monthly Mag.

Remedy for Cholera Morbus .- A friend assures us that the following simple prescription for Dysentery or Cholera Morbus, has been frequently tried, and, when made use of in season, with uniform success: - To half a tumbler of vinegar add as much fine salt as the vinegar will dissolve, and take it fasting. It will operate as a cathartic, and, if the stomach be quite toul, as an emetic likewise.

At Springfield, a young man has been fined \$10. and the costs were \$12-total 22-for taking some apples from a farmer's orchard. Not being able to pay, the young man was committed to

The Nova Scotian of last weck, contains a long article on the subject of Geology, in reference to a paper which has been published by Messrs. Jackson & Alger, two scientific American gentlemen, who have recently visited this Province, for the purpose of examining its geological and mineralogical productions.

We repeat the bopc, that some effort will now be made, to form a Geological Society. This Province abounds in minerals and other valuable substances, to which the attention of such an Institution might be profitably directed; and the individual amusement and instruction that could thus be afforded, would be ample and unfailing. Halifax paper.

INTEMPERANCE.

I will make a suggestion to a portion of the community who suffer more, perhaps, from the evil, than all others. I mean wives and mothers. Would you know how to mitigate the evil?

First, then, never offer a drop of ardent spirit to a child, as you value your future comfort. The deplorable habit of intemperance is, I have no doubt, contracted in thousands of instances in the years of infancy and youth, merely from having the dregs of flip and toddy, which the father and perhaps the mother have been comfortably enjoying; and perhaps as many more have been seduced into the habit by the misguided prescription of a dose of rum and molasses, to relieve a trifling pain. If you wish your husband to abandon the use of it, never use any yourself; and never let a day pass without having plenty of beer, or some other beverage in your cellar, which he can have as a substitute. He must be fixed in his habits indeed, if he did not take it instead of having recourse to the rum bottle.

The Vulture's power of Sight .- Professor Lichenstein remarked when travelling in South Africa, that if an animal chanced to die in the very midst of the most descrt wilderness, in less than half an hour there was seen high in the zenith, a number of minute objects descending in spiral wheels, and increasing in visible magnitude at every revolution. These are soon discovered to be a flight of vultures, which must have observed from a height, viewless to the human eye, the dropping of the animal immediately marked out for prey.

Derivation of pony .- One of the literati was puzzling his brains about the derivation of pony, when a by-stander quaintly observed, "Sir, I am astonished you don't know what a pony is derived from."-"Why," said the man of learning. "Because," said the other, "every body knows that a pony is derived from a little horse and a little mare."

If An article on the culture of the Ruspherry is deferred till next

Thacher's Orchardist.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, a further supply of

The American Orchardist; or a practical treatise on the cul-ture and management of apple and other fruit trees, with observations on the diseases to which they are liable, and their remedies. To which is added the most improved method of manufacturing and preserving cider, and also wine from apple juice and currants. Adapted to the use of American farmers, and all lovers and cultivators of fine fruit. By James Thacher, M. D. Fellow of the American Academy of Aris and Sciences; Honorary Member of the Massachusetts Medical Society, and of the New York Horticultural Society, &c. Second edition, much improved. Price \$1,00.

Seeds for Fall Sowing.

For sale at the New England Farmer Seed Store, a fresh supply of various Grass Scods—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Onion, Strasburg do. Silver skin do. Prickly Spinach and Dutch Cole for early greens -various kinds of lettuce, earrot, eucumber, cabbages, &c.-black Spanish or winter radish, &c. all warranted fresh.

Orchard Grass Seed -- growth of 1828.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, 20 bushels of prime Orchard Grass Seed, raised, this season,

with the greatest care, by John Prince Esq .- warranted to be equal in purity to any ever offered for sale in New England.
A supply of pure Gilman Wheat, raised by Payson Williams and Mr Wilchester, is daily expected.

For Sale,

A Bull Calffive weeks old of the Short Horn breed, from the best Imported Stock, both Sire and Dain, well known and highly approved. Apply at this Office for price and particulars of pedigrec. August 20, 1828.

Farm Wanted.

Wanted to purchase, or hire, on a long lease, from 150 to 300 acres of the best land, located within thirty miles of Boston—for which a fair price will be given. Address "P. D," Boston through the post-office.

Wild Geese.

For sale, five pairs of Wild Geese, two pairs three years old. quire of the subscriber. EENJ. J. PHILLIPS. lumire of the subscriber Lynn, August 16, 1828.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and Practical Hertuculuralists in the vicinity of Boston and New York, is just published by J. B. Russell, Proprietor of the New England Farmer. The articles are arranged alpha-helically, and couprise the most useful Vagetables and FRUITS which can be conveniently and economically cultivated in the climate of New England and the widdle States; as well as a Treatise on New Engenies and the violet States; as well as a Treatise on Flowers, and on Landbeaper or Thetrescyle Garbers, oo the general management of the SILE WORM, and the manufacture of SILE, and a Treatise on the culture of Grape Vines and the STRAWBERRY. The article on Frun Trees contains an enumeration and description of all the Apples Pears, Peaches, Cherries Pluins, Nectables, Apricels, &c. &c. that can be raised to the most advantage, and their relative for wardness in bearing, which will be knind to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written.

A list of the contents of the work will be 5 and in the New

England Farmer for August 1.
Price \$1.25—Six copies for \$6.00.

Hull's Trusses for Hernia or Rupture

Dr Amos G. Hull, feels a confidence in further illustrating the novely and excellence of his invention. Having devoted many years to the science and practice of surgery, it affords him a pleasure in having brought carn successful operation, a new and improved astronomical for so painful and dangerous a disease as Hernia. Various kinds of Trusses have of late been denotative definition of the principles which belong reclaimly to Dr. Holl's meeting in anong lines are the "Spiral Principles to Dr. Holl's investion," in anong lines are the "Spiral Principles are in miniation of the Theolish though muru feets perfect matraments, as he had been a Dr. Holl's though muru feets perfect matraments, and the principles are in the principles and the principles are in the principles and the principles are in the principles and the principles and the principles are in the principles and the principles are in the principles and the principles are in the principles and the principles are in the principles and the principles are in the principles and the principles are in the principles are in the principles are in the principles and the principles are in th opinion of the most emorent surgrous in the count

Dr Hull takes this opportunity to caution all persons against Dr Hull takes this opportunity to caution all persons against an infringement of his posen, the validaty of which has been fully established by judicial decessors and particularly in his soil against Rogers, tred at the lost term of the Circuit Charriet the United States. In that case, Judge Thompson charged me jury, "that the exceptions taken to the planniff's potent, were without foundation; that the specification was in an esspecies sufficient and legal; that the invention of the planniff was one of great utility; the usefulness and novely of which has been established by Physicians and Surgeons of the lagitest respectability. That it appeared they not be undered, that it is particularly. established by Physicians and congenies of the hypercrespecta-bility. That it appeared very tolly me vedence, that his statu-ment was of the greatest value in surgery; had been the means of effecting cures, in cases where the art had fail discover; to enabled persons afflicted with the disease of replace to pursue their business and labours without acconvenence; and in fact, its invention had formed a new era in the treatment of the disesse; that the instrument sold by the defendant, the one known as Mr. Farr's, and the other as Mr. Hovey's trusses, were infringements of Dr. Hull's patent;" and the jury, in that case, brought in a verdict for the plaintiff, and the damages were trebled by the court, with costs,

A large supply of the above Prisses are received, and for sale, by EBENEZER WIGHT, Druggist-Milk st. opposite Federal-st .- Agent for Poston. Aug 29

MISCELLANIES.

LINES WRITTEN IN A YOUNG LADY'S ALBUM.

BY THOMAS G. FESSENDEN.

Miss Ann, you are, it seems to me, An esscace all ethereal; The brightest being that can be, Entirely immaterial.

A pencil tipp'd with solar rays Your charms could searcely blazon; Contrasted with your beauty's blaze Bright Sol's a pewter basia.

Transceadent little sprig of light, If rhymes are always true, An angel is an ugly sprite, Compared to Sylph like you.

You frowning tell me, "this indeed " Is flattery past all bearing, "I ne'er before did hear nor read " Of any quite so glaring."

Yes this is flattery, sure enough, And its exaggeration May teach you how to hold such stuff In utter detestation.

Should beaux your ladyship accost With something like this flummery, Tell them their labour will be lost, For this transcends their mummery.

The maa whose favour's worth a thought. To flattery can't descend; The servile sycophaat is not Your lover nor your friend.

True generosity does not consist in obeying every impulse of humanity, in following blind passion for our guide, and impairing our circumstances by present benefactions, so as to render us incapable in the gardens. The early fruits have disappearof future ones .- Goldsmith.

Husbandmen, manufacturers, and tradesmen .- He who expects to find the husbandman flourishing, while the manufacturers are out of employ; or the tradesman, on the other hand, in prosperity, while the former is in distress, "let him," as Fuller New York, and 31 cents per pound paid for it .says, "try whether one side of his face can smile, I was told that forty cows would produce twenty while the other is perished."

German musicians .- The itinerant musicians in Germany, who go about the country in small bands like wandering troubadours, are a class so clever and eminent in their way, as to deserve notice. For a few florins these poor fellows will amuse you with such an exhibition of tone and skill, as It strikes me as poor economy, when it is observwould set up an English artist of the first water. They are a set of poor, but merry companionswith as little discord in their social intercourse as disturbs the harmony of their instruments. Hanpy, in spite of thread-bare coats, and sun-burnt him in his lazy disposition. faces-but with a gentility of mind, much superior to people of their class.

It is no wonder that when we are prodigal of nothing else, when we are over-thrifty of many things which we may well spare, we are very predigal of our time, which is the only precious jewel of which we cannot be too thrifty, because we look upon it as nothing worth, and that makes us not care how we spend it. The laboring man and the artificer knows what every hour of his time is worth, what it will yield him, and parts not with it, but for the full value: they are on- looms; the yarn No 16, the cloth 7-8ths yard ly noblemen and gentlemen, who should know wide.

hest how to use it, that think it only fit to be cast away; and their not knowing how to set a true value upon this, is the true cause of the wrong estimate they make of all other things.

Instinct in the ass .-- An ass was shipped at Gibraltar, on hoard the frigate Ister, for Malta. The vessel having struck on a sand-bank off the Point de Gat, at some distance from the shore-the ass was thrown overboard, to give it a chance (a poor one, for the sea was running very high) of swimming to land. A few days afterwards, when the gates of Gibraltar were epened in the morning, the ass presented himself for admittance, and proceeded to the stable which he had formerly occupied, to the ne small surprise of his landlerd, who imagined that by some mistake he had never been put on board the Ister. On the return of the vessel to repair, the mystery was explained. The ass had not only swam safely to the shere, but without a guide, had found his way from Point de Gat to Gibraltar, a distance of more than two hundred miles, through a mountainous and intricate country, intersected by streams, which he had never traversed before; and, what is most wonderful, in so short a time that he could not have made one false turn.

THE WAY THEY DO THINGS AT THE SOUTH.

The Boston Courier says it is no uncommon thing to see in the streets of Washington, three or four yokes of half starved cattle, preceded by two miserable horses, drawing a small load of wood or hay. A letter from Natches, Mississippi, to the editor of the American Farmer, contains the following:

I was transported in eleven days to this place. where I find all the tropical plants in full bloom ed, and plants are now in season. Vegetables of all descriptions are abundant; but what surprises me is, with the finest soil and extensive pasture, so little care is taken of it that butter now sells for 25 and 31 cents a pound: and the greatest portion of supply is brought from the state of four pounds of butter a week! There must be gress mismanagement some where. I observe the planters daily hauling corn out of their plantations to feed their hands and stock; this comes from up the river a considerable distance. They, I believe, pay attention to nothing but cotton, and I believe, pay attention to nothing but cotton, and purchase every thing else, instead of raising it.—
It strikes me as poor economy, when it is observed, that eight oxen are employed to haul a load of corn, which four ought easily to carry; and when to they travel at a snail's gait, to suit the particular convenience of the driver, and indulge him in his lazy disposition.

Be it remembered. That on the eighteenth day of July, A. D. 1828, in the fift, third year of the hodepeadence of the United States of America, J. B. Russell, of the said district, has deposited in this office the title of a book, the right whereof he claims as proprietor, in the words following, to wit:

The New American Gardency containing practical Directions on he Culture of Fruits and Vugetables; including Ladusteries, &c. &c. By Thomas G. Fessenden, Editor of the New berries, &c. &c. By Thomas G. Fessenden, Editor of the New Ladis and the said proprietor of the New Ladis and the said proprietor of the New Ladis and the said proprietor.

The Potato Onion, lately introduced into this country, will be a most valuable acquisition to gardeners, as it is known to produce in equal abundance to the petato, from which it derives its name; never fails, as the severe frost has no effect on it .- Dublin Correspondent.

H. wove, ing the benefits thereof to the arts of designing, engraving, and on the 8th inst. one hundred and seventy-eight etching historical and other prints. District of Massachusetts. yards of good shirting in thirteen hours on five

A farmer in Philadelphia cut his third crop of 11 tons of hay in that city, on the 15th inst. and he anticipates one crop more. His farm is in the immediate vicinity of the spot where the Declaration of Independence was signed, generally called the State House Yard. If the hay were valucd at the rent the ground would bring for building lots, it is said that it would be about 50 cents per spear.

A large cucumber .- Mr. H. Drake, of Hackett's tewn, plucked a cucumber from a vine in his garden, measuring fifteen inches in length, fourteen and a half in circumference, and weighed five pounds .- New Jersey paper.

HOVEN OR SWOLN CATTLE.

The Giornale Agrario Toscano, communicates a remedy against the dangerous effects to which cattle are hable from too free feeding on clover, and some other vegetables of similar qualities .--It censists in a solution of ammonia, to be given in a quantity of water sufficient to enable the animal to swallow it with ease. One glass is generally found effectual. Should it be found otherwise, a second is to be given at the expiration of half an hour. Ample testimony is adduced to show the value of the prescription.

IF It has been asserted that a solution of potash, pearl-ash or a strong ley made by leachingashes will answer the purpose of the above prescription .- EDITOR N. E. FARMER.

FISH USED AS A MANURE.

All the parts of fish - shell fish and all otherare excellent manures. They may be used, either salted or fresh; salted fish are generally considered the best. The o fals of fish, and fish that are spoilt for eating, may be converted to this use; but they are most useful when used as an ingredient in compost. They are so strong a manure, that it has been said one single alewife will answer as a shovel-full of the best dung, in producing Indian corn. But they cause land to exert itself so much, that it will be apt to grow poor, unless care be taken to prevent it.

Onions for Sale.

Six hundred bushels of prime Onions, (White Portugal land Straw Coloured) raised by a gentleman in this vicioity, are of-fered for sale, to traders and others, by the bushel or barrel, on very advantageous terms. Enquire at the New England Farmer Seed Store. Aug 29

AGRICULTURE.

From the Memoirs of the New-York Board of Agriculture.

REMARKS

On cutting Oats and Indian Corn-making and applying Manures-Rotation of crops, &c.

By PHILEMON HALSTED, of Westchester.

To JESSE BUEL, Esq.-Being honored with a circular from the Board of Agriculture, I will offer a few experiments which have proved to me of great advantage.

In the first place, every landholder who tills the ground should be very eareful to provide and make manure by all possible means in his power; and this he may do to a considerable extent. He should provide himself with as much fodder as will winter more cattle than he can summer; and this is done in the following manner: Cut your oats when the straw is green in part; let them lay and cure in the swath until they are sufficiently dry not to mould: bind them in sheaves, and stack them. When they are threshed, the farmer will find that his oats will thresh to greater advantage. The light oats sticking to the straw, makes it good fodder, and I consider it of as much value as will pay the expense of raising the oats.

Secondly, give up the old method of cutting your top stalks; and when your corn is sufficiently hard, or when "ou cannot find an ear soft enough to boil and eat, then proceed to cut and stout your corn in the field, in the following manner: Bring the tops of two hills together, without cutting; bind them with a few spears of straw: then cut and set up about enough to make four sheaves, if bound; then put a band of straw about the top; and then you may add as many more, and bind the whole with two bands, always keeping the bottom of the stout open, so as to admit the circulation of air. At the proper time of gathering corn, you may proceed thus: Throw down the stout, unbind and begin to gather the corn; when you have stalks enough for a sheaf, bind them and lay it aside until you have enough for a stout. By this you save all the silk and small husks and under leaves of the corn, which were all lost by the former practice of topping and gathering corn. I will recommend that the stalks be stacked on a hovel, or poles laid on crotches, and foddered in the yard. I have been particular as to the time it takes in this process, and can say I am satisfied it takes no more time than in the old method.

The farmer should embrace every open spell in the winter to collect from his milking yard the scrapings, and also from the pond holes and hollows in his woods the leaves and dirt, and draw and spread them in his yard or yards. This head of cattle,) one hundred loads of manure; to the acre. which will be fit to put on the ground the next autumn, at the rate of twenty loads to the acre; ing and preserving the top and bottom stalks for which, if ploughed in, and the land sowed with fodder. I shall proceed to my next crop, the wheat or ryc, and seeded with timothy seed at the next spring, which shall be corn, and a proportion same time, and clover the next spring, it will pro- of potatos; giving the preference to corn, on ac- Mineralogy, and if disposed, in Botany and Zool-

cattle a farmer can winter on such fodder as 1 of corn, and subduc all the wild grass roots and have spoken of. I would recommend that he weeds which laid at the bottom of the furrow .buy, in the fall, young heifers of good quality, Third year, I sulit the corn hills with a plough, and good looking young cows; and if his situ- barrow the ground well, then plough, harrow ation permits, a pair or two of steers, broken to again, and agw my oats and flax. My oats will the yoke; all of which are in demand in the produce about forty bushels, and upward per spring, and will advance in price sufficient to pay acre, depending on the season for their yielding; for the wintering, and leave for his advantage a and my flax will average six een hushels of seed, yard full of good manure. I will also recommend and three hundred weight to the acre. I will obattention paid to the hog-pen, and as much litter, serve, that where the ground is strong, and the weeds and refuse from the garden and yards, as oars very forward, they ought to be fed off to the can be procured, and by a careful mixture of some groun !, before they have a joint. This prevents good black earth, the quantity of manure may be their lodging, and gives the under oats an opporswelled to a large amount. As almost all land- tunity to come forward, which will much increase holders have on their farms ponds or swamps, the quantity. The oat stubble and flax ground that are mirey, I will recommend that they draw should soon be ploughed, harrowed and crossout, in the month of August, when most swamps ploughed: then draw on your manure, about are dry, a large quantity, and put it in a heap, and twenty ox-eart loads to the acre; spread and there let it lay until the next spring, when it will plough it in as soon as possible. If you intend to be fit to put on corn in the hill, and will have a sow rve, put it in about the first of September, very great effect. If, after the operating of the and sow your timethy seed after the harrow, frost on the heap, the compost should crumble, eight quarts to the acre; then use a roller, which and have a proportion of dust, it is then good. If breaks the lumps. It may be fed off during the it should dry hard and lumpy, like clay, it is only fall, by calves, colts or sheep, without any disadfit to be put into the barn-yard or hog-pen, and vantage. If you intend it for wheat, sow it he trodden in with the compost. By application about the twenty-fifth of September, and follow of pond manures as above, I have been enabled the same method as with the rye: sow clover

daking of manure, I shall now proceed to state above directions. I have always realized a good my process of culture. I break the ground in cron of grain, and a great crop of grass; and the the month of April, and have the sod turned un- ground may and ought to remain in sod six years, der by one of Freehorn's ploughs, about eight in- before ploughed again. ches deep; (and here it is that many make great blunders, and much to their disadvantage, by not attending in person, and having their ground ploughed deep and well;) and then harrowed with an iron tooth harrow, or wood will do, if it be heavy, and the teeth made of good hickory. and kept sharp. Harrow the same way you have ploughed, until you ground is well mellowed; then when you see the earliest apple-tree begin to drop its blossoms, furrow your ground three feet apart at right angles, and plant four grains of corn in a hill.

Almost every farmer has some method of steeping his corn before planting, and rolling it in either plaster, ashes, lime, or tar; all of which, at some times, are an advantage, and at other times a disadvantage. After my corn comes up, and is sufficiently large to be seen in rows, I commence ploughing and hoeing, and continue it until the corn begins to shew signs of setting for ears, heing particular to keep the plough a-going in dry weather. By the above culture, I have been enabled to collect from fifty to eighty bushels per acre; and by mixing pumpkin seed, and planting will enable him to make, (by the help of twenty it with the corn, I have raised four ox-cart loads

I have already described my method of collectduce a burden that will be satisfactory to the count of the great quantity of fodder. And this ogy.

owner, and the ground in better condition than year tilling, I break up the sod which laid last vear beneath the furrow of the corn plough; It may not be amiss to mention what kind of thereby I am enabled again to raise a good crop to make some poor land become very productive, in the soring, when the ground is open in cracks, As I have given some practical remarks on the about six pounds to the acre. By following the

COCHINEAL.

It appears that an experiment lately tried in Spain, and in parts of the Mediterranean, to introduce the Cochineal insect, promises to be attended with the desired result in some of the provinces of Spain, as well as at Gibraltar, and at Mal-

ta. The Indian fig is of natural growth under the climate of those countries, and being the only food of the insect in question, originally suggested the idea of its importation. It has been ascertained that the powers of fecundity of the female cochineal insect are so great, as to enable it to give birth, in the very short course of its natural existence, to no less a number than 632.727.

AMERICAN LYCEUM.

This institution proposes a system of mntual instruction, fitted to the towns and villages in New England, and other parts of the country. The instruction is to be conducted at weekly or occasional meetings for reading, conversation, discussions, dissertations, illustrating the sciences, or other subjects of useful knowledge, or popular, practical education.

To aid these exercises, it is proposed to have each branch or town Lyceum, supplied with books, simple articles of apparatus for illustrating the sciences, and their application to the business of the farmer, mechanic, or civil engineer; also, specimens of Natural History, viz. Geology, to the various classes of society in a town, and methods of inculcating them. deposited in some central place, where persons from all sections of the town, and of various pursuits and ages, can meet, according to arrangements made to accommodate the whole.

At one time, school teachers can meet, and fession, and consequently for the benefit, not of metry to education. themselves, but of their schools, and through them, for the benefit of the community and the night be formed, to be called the American Lyceworld.

haps, be tried by actual experiment.

increase both their sausfaction and success in their world. useful pursuits.

Societies of females, for literary or benevolent purposes, might improve the same opportunities, to give interest to their meetings, and greater efficiency and usefulness to their exercises.

Besides exercises fitted to the pursuits or the wants of particular classes of society, others of a more general or popular character may be introduced, such as popular lectures on the sciences, or any other subject of useful knowledge and commou interest; and these either by a citizen or citizeus, or by some one employed from abroad for the purpose.

To strengthen and facilitate the operations of the several branch Lyceums, all in a county are to be united by a Board of Delegates, who are to meet semi-annually, to adopt regulations, and forward measures for the general and mutual benefit of the whole. A County Lyceum is intended leaves. If chopped, a sharp knife must be used, also to adopt measures for the benefit of schools in their district—to collect facts respecting their thereby causing the exudation of water from them, state and their wauts, suggest improvements, and perhaps act as a Board of Examiners of school teachers in the county, and of course to take the place of town committees for that object.

SILK.

FIRST AGE-THAT IS, UNTIL THE WORMS HAVE PASSED THEIR FIRST MOULTING, OR CHANGED THEIR FIRST SKIN. (Continued from our last.)

The apartment must be light, but the san must not shine on the worms in any stage.

Feed the worms with the most tender leaves, four times a day, allowing six hours between each meal; give the smallest quantity for the first feeding, and gradually increase it at each meal between the moultings.

In about an hour and a half, the silk worms deyour their portion of leaves, and then remain more or less quiet. Whenever food is given, widen the spaces for them; scattered food may be swept into its place.

Experiments may be made as to the comparative advantages of using chopped, or whole young to prevent the leaves from being bruised, and which would prove injurious. On the fourth day the skin becomes of a hazle color and looks shining, their heads enlarge and assume a silvery bright appearance; these are marks of their approaching first change. Their food on this day,

decrease, preparatory to their first moulting, and Not only the various subjects of instruction, but their food must be duninished in proportion as the previous meal has not been completely eaten. If justly come under the consideration of this or peuded upon, the first change may not appear un-

In the course of the fifth day all the worms become torpid; during this period, and in the sub-From several State Lyceums a General Union sequent moultings, they must ou no account be disturbed. A few begin to revive at the close of um, and to perform the duties of an American the fifth day; some leaves may be then given. At the same or another time, misses and lads, Board of Education, in the most extensive sense After the first moulting, the worms are of a dark ash color.

SECOND AGE.

As the worms are fond of the young twigs, some of these should be spread over them with the leaves attached upon which the worms will immediately fasten, and they may then be removed to a clean paper; or lay a strip of chopped leaves near the worms, and they will leave the old food.

The litter is to be taken away; but as some of the worms often remain among the old leaves, they ought to be examined. To this end, the litter should be removed to another room, spread out on a table, and a few twigs placed over it, on which the worms, if any, will mount, when they may be added to the others; this rule must be attended to after every moulting. Ten per cent, is generally allowed for loss of young worms. The two first meals of the first day, should be less plentiful than the two last, and must consist of the most tender leaves; these must be continued for

If between the moultings any worms should appear sick, and cease to eat, they must be removedto another room, where the air is pure and a little warmer than that they have left, put on clean paper, and some fresh leaves, chopped fine, given to them; they will soon recover, and then maybe added to the others.

On the third day, the appetite of many wormswill be visibly diminished; and in the course of it, many will become torpid-the next day all are torpid; on the fifth day they will all have changed their skins and will be roused.

The celor of the worms in the second age becomes a light grey, the muzzle is white, and the hair hardly to be seen.

It must never be forgotten, that during the timethe worms are occupied in moulting, the food should be greatly diminished, and no more given, than will satisfy those which have not yet become torpid on the first day-or those which have changed their skins before the others.

THIRD AGE.

During this age the thermometer must range between 71° and 73°. The revived worms are easily known by their new aspect. The latest worms should be placed apart, as their next moulting will be a day later also, or may be put in the hottest part of the room to hasten their growth-This rule must be observed in the next moulting; increase the spaces.

The second day, the two first meals are to be of Education; and by appointing committees for they are used, that they may lose their sharp- the least copious, the two last the greatest, bespecific objects, viz. one to examine and recom- ness; they keep very well in a cool cellar three cause towards the close of the day, the worms mend school books; another to determine upon days; the leaves ought to be gathered over night, grow very hungry. The third day will require the most essential branches in a system of popular for the morning's meal, to prevent the danger of about the same quantity as the preceding last education; the proportionate time and attention collecting them in rainy weather. The leaves meals; but on the fourth day, as the appetites of proper to devote to each; the order in which must be pulled carefully, and not bruised. On the the worms sensibly diminish, not more than half are, numerous,

FOURTH AGE.

The thermometer should range between 68° and 71°. If the weather be warm, and the glass rise several degrees higher, open the ventilators, exclude the sun, and make a slight blaze in the chimney, to cause a circulation of the air. Widen the spaces for the worms. The leaves must now be regularly chopped in a straw-cutting hox, or with a chopping knife. The food is to be greatly increased on the second, third, and fourth days. On the fifth, less will be required, as in the course of this day many become torpid; the first meal on this day should therefore be the largest. On the sixth, they will want still less, as nearly the whole will be occupied in effecting their last change of skin. Renew the air in the der, who pronounced a finished oration, which apartment by burning straw or shavings in the chimney, and open the ventilators. If the evenings be cool, after a hot day, admit the external air for an hour. None but full grown leaves should be bereafter given to the worms, and they must be all chopped; avoid the fruit, as they would prove injurious, and add greatly to the litter. On the seventh day, all the worms will have roused, and thus finish their fourth age. The litter must be again removed.

FIFTH AGE, OR UNTIL THE WORMS PREPARE TO MOUNT.

The thermometer should be about 68°. The constitution of the worms being now formed, they begin to elaborate the silk-vessels, and fill them with the silky material, which they decompose, ing the solids and substantials on the tables around and form from the mulberry leaves. Give abundance of room-do not let the worms lie so close as to touch one another, for their respiration will be thereby impeded; continue to feed regularly and fully, as the appetite of the worms now becomes voracious; give food rather five times a day than four; even six meals will not be too many. The last meal should be late at night, and the first the next day in the morning, at an early hour. The worms are not again to be moved, Society; the only strife amongst its members, is and the huddles or feeding frames must be cleaned. On the seventh day of the fifth age, they have attained their largest size, viz. three inches long, and begin to grow shining and yellow. The appetites of some diminish, but that of others continues, and must be supplied, to hasten their maturity. The litter must be removed every two days, during the fifth age, but not when the worms are moulting, unless it can be done without disturbing them.

The preservation of the proper temperature of the apartment at this stage, cannot be too seriously impressed upon the cultivator. If sudden and great heat in the weather should take place, (as often bappens at this time) serious loss may be suffered, without proper precautions. The increased heat to which the worms are exposed, causes them to cease eating, to leave their feeding shelves, and to wander about the room, in order to find corners and places, to form their cocoons in before the silk fluid has been fully elaborated, or matured; thus defeating in a great measure all the care previously bestowed upon them. In

the former feed will be required. The first meal the summer of the year 1825, vast numbers of is to be the largest-feed those that will eat at worms were killed by hot weather, in Mansfield, any time of the day. The fifth day still less will Connecticut. To guard against sudden heat in suffice, as the greatest part are moulting; the the weather, close the window shutters while the sixth day they begin to rouse. Remove the litter, sun is beating on them, and keep the ventilators or even before they have moulted, if the worms in the ceiling or other parts of the room open, and if possible, tubs of ice should be brought into the apartment, until the thermometer shows a diminution of temperature to the proper degree. The windows must also be kept open every evening and until surrise next morning, and water sprinkled on the floor, to promote evaporation, and consequently a freshness in the air."

HORTICULTURAL FETE.

The Tenth Anniversary of the Horticultural Socicty of this city was celebrated on Monday at Mr. Niblo's Garden. The exercises commenced at 3 o'clock, by an addresss from the President, Dr. perior kind, to be named by the Society. Hosack. His discourse had more particular reference to the condition and prospects of the institution. He was followed by the Rev. Mr. Schroedresses were listened to with attention and interest by a numerous assemblage of ladies and gension. The stage was ornamented with the scenery of the establishment, the auditory with flags, green branches, and vases of flowers. Along the centre of the building stood the table containing the specimens of fruit of the season, grapes, peaches, plums, nectarines, &c. the contributions of the members of the Society. The display was a most beautiful one, comprising some of the very choicest and most tempting gifts of Pomona. Respectthese, to speak their praise it is amply sufficient to say that they were prepared under the direction of Mr. Niblo. The following were the regular toasts:

1. The United States of America.

2. The President of the United States.

3. Horticulture, one of the most useful and elegant arts of Peace.

4. The Day. The Tenth Anniversary of our for the furtherance of its object.

5. Agriculture, Commerce and Manufactures .-We are too equally the debtors of each, to withhold from them equal protection.

6. The Navy and Army of the United States, the fruitful sources of contribution to our Horticultural preducts.

7. Our associate institutions throughout the world-indulging the same feelings in different climes.

8. The universal alliance of men for good purposes.

9. Our Sister Societies of London, Edinburgh and Paris.

10. American Gardeners; they know how to protect the soil they cultivate.

11. The memory of De Witt Chiton; the Patron and Honorary Member of this Society.

12. The Orator of the Day.

13. The Fair Sex.

The toasts were interspersed with music by Mr Willis's band from West Point, which played several of the fine airs of Rossini and Weber, and with appropriate songs from some of the musical gentlemen of the company. Several excellent volunteer toasts were also given. The following will serve as a brief catalogue of the fruits display-

Grapes, by Mr. Armitage, of New York; four kinds, very superior, from Mrs. Griffith, of New

Jersey. Do. very fine, from Mrs. Saltus, N. Y.; six kinds do. from Professor Gimbrede's vineyard, at West Point, very fine ; do from Mr. Oakley, Greenwich.

Gages and Plums, from 1. Denniston, Esq. Albany; do. from Jesse Buel, Esq. of a new and su-

Pine Apples grown on this Island by Herman Thorne, Esq.; strawberries, by Mr. A. Parmentier; peaches, from Mrs. Van Nortwick, N, J.;do. J. Selby, Flushing; superior grapes from the was both pertinent and classical. Both the ad- garden of Dr. Hosack; fine peaches and grapes, from Philadelphia; white Holland plums, from L. Dennison, Esq. Albany ; German gage, do. ; Chertlemen. At 4 o'clock the Society and their guests ckee plums, Mr. Selby, Flushing; decorations of in number about 200, sat down to dinner at tables flowers, by Messrs Floy, Wilson, Hogg, and Cooke; in Mr. Niblo's little Theatre, the Sans Sonci-the superior nectarines, Mr. T. Ash ; variety of melons; pit of which had been floored over for the ocea- apples from Dutchess county; current wine, from Mrs. Griffith, N. J.; wine, from Edenton. N. C.; creecy wine, six years old; catawba wine, from Dr. Mitchell.

The following are the Officers for the ensuing

For President, David Hosack, M. D.

Vice Presidents. John R. Murray, Jacob Lorrillard, William Neilson.

Treasurer, John Groshon.

Corresponding Secretary, Abraham Halsey. Recording Secretary, William R. Cooke.

Council .- N. H. Carter, John I. Palmer, Wm. Curr, Charles Henry Hall, Michael Floy, Israel Dean, Andrew Clark, Richard Hatfield, Alexander Smith, Francis Cooper, Wm. Fairbairn, Wm. M. Ireland, M. D. Andrew Parmentier, Michael Burnham, Thomas Kinnersly, Nicholas Saltus, Wm. Seaman, Thomas Hogg, Geo. Newbould, Win. Neale, Charles Oakley, Wm. Wilson, Oliver M. Lownds, G. W. Arnold, Wm. Phelan, Gavin Yuill, Peter Hatrick, Samuel L. Mitchell, Peter Aymar, Isaac Adriance, James Mc Brair, Edward Probyn, Wm. M. Price, George Nixon .- . V. Y. Statesman.

Electrified Seeds and Plants .- By a series of experiments, M. Astier seems to have proved that when seeds or plants are electrified, they vegetate much more rapidly than in other circumstauces. Some of his experiments were made on the monthly rose, (Rosa Sinensis and R Sempervirens,) which, when submitted to electric influence, produced more early flowers, and in greater abundance .-It would be worth while to try what effects might thus be produced on flower seeds in the way of improving color, size, doubling, &c.

Safety guns are made at Birmingham so constructed as to be completely guarded against accidental explosion.

\$3,000 damages have been given in England by law, to an individual injured by a bag of wood falling upon him, which was thrown from an up per room of a warehouse.

DRAINS.

wettest part of the soil, although it should be necessary, in order to effect that purpose, to devian half deep; with the earth all thrown out on to pay for the expense of digging the ditches. one side, and banked up as high as possible." Sir John Sinclair states, that, "It is a general rule regarding open drains, with a view of giving sufficient slope and stability to their sides, that the width at top should be three times as much as that which is necessary at the bottom, and in the case of peat mosses or soft soils, it should be such as to allow the water to run off without stagnation, but not with so rapid a motion as to injure the bottom."

But before you attempt to drain a piece of land, it will be well not only to calculate the cost, but to ascertain the nature of the soil which it is proposed to render fit for cultivation. If the subsoil clined to laugh it off: but it would not do. It or under layer be clay, the swamp may be worth seemed there was a law that if any person shall draining, though there should be no more than six ENTER UPON any grass land, ORCHARD, or garden, inches of black soil or mud over it, for the clay without permission of the owner thereof, with indertake draining, unless the depth of black mud shall be liable to be sued by the owner besides .riation from these general rules.

Beginning at the outlet, pass a large ditch through penalties shall be DOUBLED. it, so as mostly to cut the lowest parts. Then | Finding this law very plain, and the magistrate drains should be cut in several of the lowest parts. such trouble is, to keep out of such orchards. The bottom of the main ditches, when the soil is not of an extraordinary depth, must be lower than the bottom of the loose soil; otherwise the soil will never become sufficiently dry and firm."*

It is said by Sir John Sinclair, (Code of Agriculture, page 182,) that "in all drains, it is a rule in the season as otherwise might happen."

Drains used in farming are of two kinds, open out of a ditch or drain, should not be suffered to casioned by an influx of water upon ignited matter in and covered. Drains should be of a size and lie in heaps or banks by the side of the ditch, but volcanoes. In proof of this it is observed that they depth proportioned to the extent of the swamp should be spread as equally as possible over the occur mostly in the immediate neighbourhood of and the probable quantity of water for which surface of the drained land. In this way, the volcanoes; the more remote they are the more they are designed to be channels. They should matter taken from the ditches will tend to level feeble. It is known that volcanoes have usually generally be carried through the lowest and the surface of the swamp-will, perhaps, serve in some connection with the ocean, for they someaffy impediment to the passage of the water to different kinds. How far the ignited matter exate from straight lines. Open drains sometimes the ditches. In some cases it may be advisable tends under the sea in a horizontal direction from pefluous water, and of inclosing fields. But they ditches, to the farm yard, or the hog pen, to form to some distance as volcanoes occur in the vicinity make a hazardous and inconvenient fence without a part of that layer, which good farmers generally of the ocean. The pressure of water 2 or 300 the addition of a bank, hedge, or railing. The spread over those places in autumn, to imbibe feet in depth is so immense, that we may easily for a fence, it ought to be four feet wide at the In many instances, we are told, that the earth thus top, one or less at the bottom, and about two and dug out of ditches is thought to be worth enough

STEALING FRUIT. A young man employed in the factory in this town, on wages of \$5 per month, and his board, feeling rather frolicsome, went into a farmer's orchard, "just over the fence," and took three sweet apples - only three - and, moreover net very good ones. This was in the evening. There were ten or twelve young fellows with him, but he was the scape-goat; and it so happened that the farmer, having suffered before from such frolies, concluded to try titles to his fruit, at the first chance .-The young man was arrested, and was quite inand the mud mixed will make a fertile soil. But tent to carry away any FRUIT, with the intent to if the subsoil or under stratum be gravel or white injure or defraud such owner, he shall be fined sand, it will not, in common cases, be best to un- not less than two, nor more than ten dollars; and be as much as from fifteen to eighteen inches And if, having entered, he shall actually take any deep; for the soil will settle after draining, and fruit, he shall be fined not less than five, nor more be less deep than it was before. But the situation than fifty dollars, besides being liable to be sued of the land to be drained may authorize some va- for three times the value of what he takes. And if either of the above offences are committed on The manner of draining a swamp is as follows: the Sabbath, or between sunset and sunrise, the

make another ditch quite round it, near to the finding the case very plain, the youth was fined border, to cut off the springs which come from ten dollars-being five dollars for the offence, and the upland, and to receive the water that runs five dollars for committing it in the night. And down from the hills upon the surface, in great then there was the expense of getting proof, &c. rains. These ditches should be larger or smaller, amounting to twelve dollars and some cents-say in some proportion to the size of the swamp, the twenty two dollars and a half, in all !!!-the washape and size of the hills which surround it, and ges of four months and an half. The unfortunate other circumstances, which might tend to greater issue of the affair frightened the young friends of or less quantities of water being occasionally or the transgressor, and he was left in gaol!! generally led to the ditches. If the swamp be -a warning to all who are disposed to go out uplarge, it may be necessary that some smaller cross on "hooking sprees." The way to keep out of

IMPORTANCE OF KNOWLEDGE TO FARMERS.

1. The farmer eught to rise early, to see that others do so, and that both his example be followed, and his orders obeyed. 2. The whole farm should be regularly inspected, and not only every field examined, but every beast seen at least once a day. 3. In a considerable farm, it is of the utmost consequence to have hands specially appropriated for each of the most important departments of labour, for there is often a great loss of time, where persons are frequently changing their employments; and the work is not executed so well. 4. Every means should be thought of to diminish labour, or to increase its power. For instance, by proper arrangement five horses may do as much labour as six perform, according to the usual mode of employing them. 5. A farmer ought never to engage in a work, whether of ordinary practice, or intended improvement, except after the most careful inquiries; but when begun, he ought to proceed in it with much attention and perseverance, until he has given it a fair trial. 6. It is a main object in management, not to attempt too much, and never to begin a work, without a probability of being able to finish it in due season. -7. Every Farmer should have a book for inserting all those useful hints, which are so frequently occurring in conversation, in books, and gathered in the course of his reading, or in a practical management of his farm .- Sinclair.

INHUMAN TRANSACTION.

A valuable fat ox, the property of A. F. Sawver, of Mount Vernon, was, on Monday last, barbarously stabbed, by some malicious person, apparently with a pitchfork; the tines of which perforated his body in four places on each side, thro' the hide into the intestines. The wounds being adjudged such as must necessarily destroy the life of the ox, it was immediately slaughtered. Sufficient evidence being adduced on the spot to fix the suspicion on a person in the vicinity, he was arrested by Mr S. on an action of damage-and he will also doubtless be arraigned in behalf of attributing earthquakes to a volcanic origin. In the State, to substantiate his innocence, or answer for his guilt .- Amherst Cabinet.

LONDON MANURE.

Several vessels have arrived at Perth this spring from London with cargoes of manure. It is laid down at the quay, free of all charges, at from six shillings and six pence, to eight shillings per ton; this may be about one shilling, or one shilling and

^{*} See Deane's New England Farmer, Art. Drains.

tained in the neighbourhood, but the farmers say this difference is more than counterbalanced by the superior quality of the London article. There is sometimes difficulty in freighting a vessel, for this purpose, as the cargo is not only unpleasant but dangerous, as it keeps its level amidst the shiftings of the vessel; but the present state of the coasting trade obliges ship-owners to take strange cargoes.

SAFE AND CERTAIN.

thirds of a gill of N. E. Rum, rub the mixture on the head when going to hed and cover it with a cap or handkerchief.

By applying the above from one to three nights, will save parents much time and trouble .- Kenne bunk Gazette.

ford some reason to suspect that the conferva zonata of Linnæus, an aquatic production, the green colour of which has hitherto led to its being considered a plant, is endowed with animal life.

From the American Farmer.

HEDGES.

Mr. Skinner .- In the 15th number of the current velume of the American Farmer, "A correspondent wishes to know which is the best kind of thorns for hedges," &c. I have had some experience in that branch of improvement, and am wiling to communicate it. I have planted three different kinds, namely : the Virginian thorn, raised in abundance, and sold by Mr. Joshua Pierce, at his nursery, Linnæan Hill, near Washington, from 4 to \$5 per thousand, according to the quantity purchased. The English white thorn, which I imported from Liverpool, cost with charges from 5 to \$6 per thousand, a native thorn found in my own neighborhood, and which I have seen in abundance in several places in this State and Pennsylvania; I know not the botanical name, but in a natural state, it grows large, of a circular formed top, with a dark green oval leaf, something resembling that of a pear tree, the thorns very long and up, they will get thin at the bottom. sharp, the berries large and red. I have been told it is the same as the New Castle thorn ; for cessity of this species of improvement, that I am the mode of raising the plants, see Mr. Mahon's the hardsomest hedge; I prefer it for a garden or lawn; the second sends out a great many lateral branches, and makes a close compact fence; the third is of a most exuberant growth, and shoots out in all directions, perhaps the greatest objection will be the expense of keeping it in proper bounds; I have had shoots of one year's growth upwards of 6 feet long. I am of opinion that with proper management, a sufficient fence can be made of any of the three kinds in 4 or 5 years. I have also a hedge of the wild crab ap-days 19½ pounds avoirdupois of butter, and had ple, that I think will answer the purpose and am now preparing to plant the honey locust, that I think may excel them all, but as yet cannot positively decide. My mode of planting is, after mapossible; then dig it out as deep as the good soil ter .- Palladium.

goes; this I lay on the one side of the treuch, and shovel out the sub-soil on the other side to the depth of 9 or 10 inches; this being done, let a careful hand go into the trench, and place the plants against each side of it at the distance of S or 9 inches, forming a double row 12 inches apart, and boy to shovel in first the good earth, and then what came from below; care must be taken to fix the plants at the proper distance, and tramp the earth firmly about the roots. Before planting, I To destroy nitts and lice on Children's heads, cut off all the straggling roots, and afterwards I Take a table spoonfull of black pepper, pound it cut the tops within an inch of the surface; after tine, steep it moderately, for ten minutes in two the first year, I again cut off about three inches from the ground; after the second, about twelve inches, and so on every year, letting them rise gradually, according to their vigor, till they come to a proper height; by these means I thicken my hedge at the bottom, otherwise it would be no fence, especially against the swinish multitude, that are always on the look out and ready for mis-Botany .-- Recent microscopical observations af- chief. As to planting, I consider it immaterial, whether tis done in fall, winter or spring, if the ground be in good order; but if you have much to do, and defer it to the spring, there is a chance of the buds putting out before planting, which I would avoid if possible.

Probable Cost.

nuring and preparing the ground.

I suppose a good spadesman, assisted by a boy, will plant 20 perches in a day-wages and vietaals I value at \$1.

Suppose you plant at 8 inches distance in the row, it will require 50 plants to the perch---and suppose you value the plants at \$4 per thousand, the cost per perch will be as follows, viz:

50 plants at \$4 per thousand. 20 etc. Expense of labor, 5

cts. 25 per perch.

Protection from cattle and sheep will be necessary for 3 or 4 years. They should not be planted nearer any protecting fence than 3 ft. nor where too much shade of trees will reach them, nor should they be allowed to rise higher than about 5 feet at any time, for if they are allowed to shoot

I am so well convinced of the efficacy and neastonished at its being so little attended to, and I agricultural society, the least notice taken or encouragement given to it.

Yours respectfully, C. BIRNIE.

Thorndale, Taneytown, 14th. July, 1828.

The ship Alexander has just brought for Colonel Power an extraordinary improved Durham short horn cow, which produced in England, as appears by certificate, 30 quarts of milk per day, in June last, and afforded from the milk of seven continued to give milk until the birth of her calf. U. S. Gazette.

Cheese .- Several reasons being suggested for nuring the ground well, and planting potatos on cheese being sometimes poisonous: Another has it, (which enriches and cleans it from weeds) I occurred to the writer, from observing a number if well managed, continue in perfection five or six stretch two lines in the intended direction at a of thirsty cows drinking the "green mantle of the foot apart, and mark it off with a spade as deep as standing pool," in a pasture, for want of pure wa-

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 5, 1828.

THE RASPELRRY - Rubus House.

In compliance with the request of a respected friend and correspondent, we give some notices of this shrub, and its cultivation.

Mr Lowell in the " . N. r . Imerican Gardener," page 136, says, "there are only two se is of raspberries of any great value, the white An werp, and the red Antwerp. The cane, or smooth stalked, is also praised by some persons, but we have had no success with it; it seems to us to be our native raspherry."

London enumerates the following varieties, "early small white; large white; large red; most large red Antwerp; large yellow Antwern; cane or smooth stalked; twice bearing white; twice bearing red: smooth cane twice bearing."

Abererombie gives the following for the culture of this shrub:

Propagation. The varieties can be perpetuated by young sucker-shoots rising pienteously from the root in spring and summer; when these have completed one season's growth, they are proper to detach with roots for planting, either in the autumn of the same year or the next spring, in February or March, but not later than the middle I estimate that the potato crop will pay for ma- of April. These new plants will bear some fruit the first year, and fornish a succession of strong bottom shoots for full briaring the second season. New varieties are easily raised from seed-and they come into bearing the second year.

Soil and site .- All the varieties will succeed in any common mould, treuched about two feet deep, and sufficiently manured; but the soil in which the ramberry-bush most prospers and bears the finest fruit, is a light rich loam. Allot the main crep a free exposure to the sun, that the berries may ripen in perfection. Be careful to favor the twice-bearers with a dry soil, and a sheltered sunny situation, to give the second crop every aid in coming to materity. When raspberries are cultivated on a large scale, it is best to keep them in plantations by themselves. Set these in rows from four to six for, asunder, as the bushes are of the smaller or larger kinds, by three or four feet in each row. Scattered bushes may either occupy a single row lengthwise along the back part of a herder, or stand in detached stools, at ten or fifteen feet distance. Select sorts are fre-Gardening. The first mentioned, I think makes am still more astonished, that I never saw by any quently trained against walls, stakes, or espaliers. from the most sunny to the most shady aspect, for carly and late fruit of improved growth and flavor." Neill says, "The raspherry-bush grows freely in any good garden soil; but it is the better for being slightly most. Although the place be enclosed by trees, and even slightly shaded. the plant succeeds. In an enclosed and well sheltered compartment, with rather a damp soil, containing a proportion of peat-moss, we have seen very great crops of large and well flavored berries produced; for example, at Melville-House, the seat of the Earl of Leven, in Fifeshire."__ Haynes also recommends well manured bog-earth. and a situation naturally or artificially shaded.

New plantation .- Raspberry-bushes are in their prime about the third and fourth year; and, years; after which, they are ant to decline in growth, and the fruit to become small, so that a successive plantation should be provided in time.

feetion as to bearing."

Summer culture .- " Keep them clear from weeds during the summer by hoeing between the rows; at the same time, loesen the earth about the plants. Under this management, the plants, if tolerably strong, will both yield a moderate crop the first summer, and supply young stems for bearing in greater plenty and perfection the following season; and so, from year to year, the summer culture should be repeated. As the plants get established, let all straggling suckers between the rows, or from the extreme roots of single stools, be cleared out by hoeing, or twisted off, to admit the air and sun freely to the fruit.'

Pruning and winter dressing .- " It is requisite every winter or spring to cut out the dead stems, and to thin and regulate the successional young shoots. This annual pruning may be performed any time, during open weather, from November till the beginning of April. When kitchen-garden crops are cultivated between the rows, it is most convenient to do this as soon as the old bearers begin to decay. As to pruning indiscriminately in the open weather of winter, it sometimes happens that severe frosts immediately follow, and partially kill the plants: therefore it is safer to shorten the tender young stems early in spring; but let it not be deferred till the buds are making new shoots, as that would weaken the root. Cut out all the old dead stems clean to the bottom; and, having selected from the strongest young shoots on each main stool, three, four, or five, to be preserved for a succession of bearers, cut away the superabundant close to the ground. Let each of the shoets retained be pruned at top, below the weak, bending part; cutting in the smaller plants, to about three or four feet in length, and in the large sorts, to the length of five or six feet. If any of the stems diverge irregularly, or straggle much asunder, they may be tied together at top, and thus the strong ones will support each other; or the taller varieties may have the support of stalles. Prune plants against a wall or trellis as above; and train the shoots to tise a little diagonally. After pruning, having eleared away the cuttings, dig the ground between and about the plants. To turn in a little rich compost every year will conduce to plentiful and fine returns; lay it at the extremities of the roots, and deeper as the plantation gets older. Eradicate all straggling suckers."

To obtain fruit of a very large size .- The fruit of the raspberry may be obtained of a very large size, other circumstances being of the most favorable kind, by destroying all the suckers; but in this way, the plant being destroyed, a double plantation is wanted, one to grow only suckers, and the other fruit. In this way Recht, at Berlin, produces plants ten and twelve feet high, with fruit tried the experiment." larger than any we have seen in this country .-(Versuch den Weinbau, &c. p. 46.)

Taking the crop .- The fruit of the different varieties comes in from the end of June or July till October or later. As it ripens, it should be timely gathered for immediate use; because, when fully ripe, it will not keep above two or three days before it moulds, or becomes maggotty, and unfit to be used."-(Abercrombic.)

Raspberries may be forced equally well with gooseberries and currants, and, like them, either In M. Hope's garden at Haarlem, the raspherry wards of \$42,000.

Select new plants from vigorous stools in full per- is planted outside along the north and south sides of a pit; the shoots of the preceding year trellis, and forced while the suckers are left to grow upright in the open air.

ADVANTAGES TO BE DERIVED FROM AGRICULTURE.

The celebrated Watson, Bishop of Landaff, in a ture, has the following passage.

"The agricultural improvements which have hitherto taken place amongst us, have been by the expenditure of private wealth; but the country cannot be brought to that proportion of cultivation, of which it is capable, unless individual efforts are aided and accelerated, by public wisdom and munificence. I boast not of any particular patriotism, but I would willingly pay my share of twenty or thirty millions of public money, to be appropriated by the Legislature, to the agricultural improvement of Great Britain and Ircland. This appears to me to be an object of far greater concern to our independence as a nation, than any extension of commerce or any acquisition of distant territory ever can be. If the time should fully come when an unproductive acre of land could not be found in either of these, our fortunate islands, we shall then have food within ourselves, for the annual sustenance of at least thirty millions of people, and with a population of thirty millions, what power in Europe, or what combination of powers L dare to attempt our subjugation.".

SELECT SEED CORN.

It is highly important that your seed corn should be selected from the best samples which can be obtained, as the offspring whether vegetable or animal will in a great degree partake of the good or bad qualities of the parent. The following directions on this subject are from a scientific and practical agriculturist :

"When the first ears are ripe enough for seed, gather a sufficient quantity for early corn or replanting; and at the time you would wish your corn to be ripe, generally, gather a sufficient quantity for planting the next year, having particular care to take it from stalks that are large at bottom, of a regular taper, not over tall, the ears good sizeable ears of the best quality; let it dry speedily; and from the corn gathered as last desshould be missing, replant from that first gathered, which will cause the crop to ripen more regularly than is common, which is a great benefit .tity, and improved the quality of my crops beyond

Dr Deane observed that "some recommend gathering seed corn before the time of harvest, being the ears that first ripen. But I think it would be better to mark them and let them remain on the stalks, till they become sapless .-Whenever they are taken in, they should be hung up by the husks, in a dry place, secure from early frost; and they will be so hardened as to be in no danger of injury from the frost in winter."

The donations and subscriptions for the Thames planted in pots or in the soil or floor of the house. Tunnel, up to our last dates, amounted to up-

This softens the old scaly bark, which peels off the following winter and spring, and is succeeded by firm, smooth new bark .- Repertory of Arts, vol. iv.

HORTICULTURE.

The Editor of the New Bedford Courier in that paper of the 12th ult. has given a friendly and favourable notice of the New American Gardener. recently published at this office; and closes his remarks with the following just and well expressed observations on the importance of the "subject to which it is devoted:"

"We rejoice in the increasing attention which is given to the improvement of Horticulture in New-England. Let us imitate, in this respect at least, the noble example set us by our parent country. Travellers who visit England find nothing which calls forth their enthusiastick encomiums more than the taste and skill with which her country residences are adorned by the hand of successful cultivation. Almost every field is a paradise, we are told, in the ardent and somewhat extravagant language of their praise. Our gardens have been comparatively neglected. With a few exceptions. and those principally in the vicinity of our State capital, there have not been many enclosures heretofore in this part of the country, which an Englishman of taste, familiar with the state of cultivation at home, would consent to honour with the name of a garden. But what is there to prevent the gardens of New-England from attaining, with proper attention to cultivate and diffuse a correct taste in horticulture, the heanty and elegance so highly extolled in English gardens? To come still nearer home : though those who live in towns eannot all be farmers, they may all of them, in a set low, and containing the greatest number of town not more compactly built than ours, to a limited extent be Horticulturists. No man is aware. till he has tried the experiment, how much, by cribed, plant your main crop, and if any hills judicious arrangement, can be made to grow on a quarter of an acre of ground, or even on a smaller quantity; how many of those fruits, vegetables, and flowers, the best methods of rearing which The above mentioned I have practised many are pointed out in the book before us, may be culyears, and am satisfied it has increased the quantivated to advantage in his little garden. The rapid improvements of our gardens and grounds what any person would imagine, who has not within a few years, shows that we have learned something of the powers of cultivation, that we are in some measure aware of what skill and taste can accomplish. But we have much yet to learn and to do. Let us profit from the experience of others, while improving and beautifying, each one his little domain. The studious and sedentary man will find in this employment a relaxation at the same time both of body and mind; and while the face of external nature grows daily more beautiful beneath his forming hand, the healthful and invigorating exercise imparts a kindred beauty to the intelligent spirit within that plans and directs its operations, and both alike conspire to promote his 'being's end and aim.' "

PARSNEPS.

Cause cows to give ahundance of milk, and they cat them as freely as they do oil cake. In giving an account of the agriculture of the island of Jersey, an English writer says "Parsneps are grown by every farmer, and either by the spade culture alone, by the plough and spade, or by the small and great plough; any soil in good heart and tilth suits them, but peculiarly a deep loam; which I have raised two seasons, from seed purand in the same spot, generally, are raised beans, chased at the New England Farmer office. Put peas, cabbage, and, occasionally potatoes.

the field is once harrowed; straight lines are then them in a gentle heat near the kitchen fire,drawn across, by means of a gardener's rake, usually from north to south; women then proceed with dibbles; and set the beans in rows, at a distance of four inches, or five inches, from bean to the vinegar soaks up, fill the pots with very sharp the vinegar soaks up, fill the pots with very sharp can, leaving intervals of between cach of the sown rows. In the use the tween cach of the sown rows. In the use the tween cach of the sown rows. In the use of the dibble, and in dropping the beans, the comen have acquired considerable dexterity. In any instances they are followed by children, who rop in each hole made by the dibble, after the can, three or four peas; the parsuep seed is then the tine to of one third to one half a bushe of the area. -Quayle's General Ying of the Norman stands.

The writer above quoted asserts, that, in the signal of Jersey, parsuep "is caten with meat, the care of Jersey, parsuep "is caten with meat, in cash and of Jersey, parsuep "is caten with meat, in can, three or four peas; the parsueps seed is then the care. They writer above quoted asserts, that, in the signal of Jersey, parsuep "is caten with meat, in cash and of Jersey, parsuep" is caten with meat, in four parsue property of the care of the vinegar soaks up, fill the pots with very sharp bolling vinegar. In this way I have kept them in bolling vineyar. In this way I have kept them in thave kept them in thave kept them in the lust way I have kept them in the vine gar soaks up, fill the purculation in the vine gar, for dor the setugation of the setugation in the first of the trace of 12 1-2 cats f bean, in four, three, and sometimes two ranks of boiling vinegar. In this way I have kept them in beans, leaving intervals of between five and six the finest order till they were all used, a few days feet between each of the sown rows. In the use of the dibble, and in dropping the beans, the women have acquired considerable dexterity. In drop in each hole made by the dibble, after the bean, three or four peas; the parsnep seed is then sown at the rate of one third to one half a bushel Islands.

the island of Jersey, parsnep "is eaten with meat, walnuts. with milk, and with butter; but not, as in the common mede of using it as human food in England, with salt fish, or, as in Ireland, together with potatos.

"The next most valuable application of this root is hog-feeding. At first it is given to the animal in a raw state, afterwards boiled or steamed, and finally, for a week or fortnight, with bean and outmeal. A hog treated in this way is sufficiently fatted for killing in about six weeks. Its flesh is held superior to that arising from any other food, and does not waste in boiling.

" Bullocks are also fatted with parsneps in about three months; their flesh is here considered of superior flavor to any other beef, and commands, on that account, an additional half-penny in the pound on the price. To milch cows they are also usually given; on this diet, the cream assumes a vellow colour. By the accounts here given, it appears, in proportion to the milk, to be more abundant, than when the animal is kept on any other food whatever. When the cow receives at the rate of thirty-five pounds per day, with hay, seven quarts, ale measure, of the milk produce seventeen ounces of butter. It is generally allowed that the flavor of the butter is superior to any other produced in winter.

"Geese are sometimes shut up with the hogs to fatten on parsneps, which they will eat raw .-The root is also given boiled; and for a week before killing they are fed with oats or barley only. Horses eat this root greedily; but in this island it is never given them, as it is alleged that, fed on this food, their eyes are injured. About Morlais, horses are not only ordinarily fed on parsneps, but they are considered as the best of all food, superior even to oats."

At a meeting in London, at which the Duke of Wellington presided, it was agreed to open a subscription to complete the Thames Tunnel. 27,000 dollars were subscribed the same evening. The Duke said the sub-marine road would be completed if funds could be raised.

TO PICKLE GIRKIN CUCUMBERS.

As inquiries are frequently made here on the best mode of pickling the Girkin cucumber, lately introduced, we have solicited and obtained the following recipe from a gentleman of this city, who has been cannently successful with them:

" Ma Russell -- I enclose you the recipe for pickling the fine and delicate Girkin cucumbers, them in a brass kettle, with strong salt and water, "When the ploughing or digging is completed, -cover them with cabbage leaves, and keep change the water three times every other day,drain them in a basket,-put them in pots, and pour boiling vinegar on them. In a few days, as

many instances they are followed by children, who the Girkin cucumber being a tropical plant, (from to the acre. - Quayle's General View of the Norman July, when the earth has acquired a sufficient de-

Farm Wanted.

Wanted to purchase, or hire, on a loog lease, from 150 to 300 acres of the best land, located within thirty miles of Beston—for which a fair price will be given. Address "P. D.," Boston, discount for the part of the second the part of the second the sec through the post-office.

Seeds for the West Indies.

Merchants, masters of vessels and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.— Likewise the greatest variety of seeds to be found in New England, by the pound or boshel, all warranted pure, and of the growth of 1827.

Onions for Sale.

Six bundred bushels of prime Onions, (White Portugal, and Straw Coloured) raised by a gentleman in this vicinity, are ci-fered for sale, to traders and others, by the boshel or barrel on very advantageous terms. Enquire at the New England Farmer Seed Store. Aug 29

SUBSCRIPTION.

MISCELLANIES.

FOR THE NEW ENGLAND FARMER.

The criteria of a beautiful cow, according to Wilkinson, may be thus expressed.

She's long in her face, she's fine in her horn, She'll quickly get fat, without cake or corn, She's clear in her jaws, and full in her chine. She's heavy in flank, and wide in her loin.

She's broad in Her ribs, and long in her rump, A strait and flat back, with never a hump ; She's wide in her hips, and calm in her eyes, She's fine in her shoulders, and thin in her thighs.

She's light in her neck, and small in her tail, She's wide in her breast, and good at the pail, She's fine in her bone, and silky of skin, She's a Grazier's without, and a Butcher's within,

TROUT FISHING.

The following apostrophe taken from a poem ascribed to Dr. WOLCOTT, proves him to have been no friend to piscatory amusements.

> Why fliest thou away with fear ? Trust me, there's nought of danger near ; I have no wicked book. All covered with a staring bait, Alis! to tempt thee to thy fate. And drag thee from the brook.

Oh! harmless tenant of the flood. I do not wish to spill thy blood-For nature unto thee, Perhaps, hath giv'n a tender wife, And children dear, to sweeten life, As it hath done to me.

Enjoy thy stream, then, barmless fish : And, when an augler, for his dish, Through glutteny-vile sin! Attempts, a wretch ! to pull thee out, Heaven give the strength, O. gentle trout, TO PULL THE RASCAL IN!

Cracking a Pun .- Two Bucks, who were sitting over a pint of wine, made up for the deficiency of port by the liveliness of their wit. After many jokes had passed, one of them took up a nut, and holding it to his friend, "If this nut could speak what would it say?". "Why," rejoined the other, "it would say, give me none of your jaw."

The indulgent parent, who takes pleasure in giving a child, after the age of eighteen months, all he craves, "should be represented," says a celebrated physician, "as a directing post in a crossroad, with three indexes, one pointing to an ignominious death, one to a hunatic asylum, and the other to poverty and distress."

Massa's Foot .- The following circumstance is a striking illustration of the utter recklessness of feeling in relation to all that is endearing to human nature, which a state of slavery produces in the bosom of its victim:

A negro in Kentucky, not long since, had acwas likely to prove fatal, through want of care .-Massa's foot,-If Massa want him well, he may cure him heself."

was desirous, without the ceremony of a formal through procrastination or carelessness, we com-

courtship, to ascertain her seutiments. For this mit a flagrant breach of the law of love, and expurpose he said to her one day—with that kind pose ourselves to the indignation of Heaven. of air and manner which means either jest or earnestness, as you choose to take it-" If I were thing. The man who would approach as nearly to ask you whether you are under matrimonial engagements to any one, which part of your name will do well to take heed lest he die in the State (No-yes) might I take for an answer?"

"The first!" said she in the same tone.

"And if I were to ask if you were inclined to form such an engagement, should a person offer who loved you, and was not indifferent to youras an answer?"

"The last."

"And if I tell you that I love you, and ask you to form such an engagement with me; then what room. This incident may account for the burnpart of your name may I take?"

"Oh then," replied the blushing girl, "take the whole name, as in such a case I would cheerfully resign it for yours."-[Alb. Chron.]

treat of the Horticultural Society at Cheswick, ing a hole likewise through the bottom of the England, there was a fine display and hearty con- cart. sumption of veal, hams, chickens, jellies, coffee, tea, hock, claret, campaigne, sherry, port-pines, peaches, cherries, grapes, melous, and strawberries. The horticultural part was very small. The best pines were from the garden of Lord Ellenborough. It seemed to be generally agreed that much of the fruit had been cultivated away from its rich natural flavor. At a horticultural treat should be nothing but garden fruits, unless you choose to consider every thing as coming from the earth, as the food for the animals, and the grapes for the wine, &c. But then the ice must be excepted.

To whom it may concern .- It is surprising how lightly the obligations of strict honesty seem to set upon many persons who would fain be considered very good men. If they wish to sell an article, they appear to suppose that an erroneous statement concerning it, or at least a concealment of its defects, is perfectly admissible; and when the bargain is completed and the writings signed, if the purchaser remonstrates, they will laugh at him to his face. If they have incurred an honest debt, which by some quirk of the law it is possible to evade, they will postpone it and postpone it, and probably never pay it at all. If a mistake has occurred in their favor, they will never rectify it .-Nay, there are men who profess better things, whom if you entrust with the collection of monies or other confidential business, it is extremely doubtful whether the proper returns will ever be made, unless you pursue them continually with the glance of your eye. In short, we believe there are some pious men, who have formed such habits of carelessness and negligence, that the less you have to do with them the better.

We mention these things, not because we have suffered more from dishonesty than many others; cidentally inflicted a wound on his foot, which but because we view its opposite as a part of Christian morality. A dishonest Christian is a con-A person asking the negro why he did not bind it tradiction in terms. And we are anxious to imup, was answered :- "He be no my foot; he be press it upon our readers, and also upon ourselves, that in all pecuniary transactions, if we practice frand, under whatever guise, and however intangible by the law, it is done at the peril of our souls. Courtship .- A gentleman feeling a strong par- If we are entrusted with another man's business, tiality for a young lady whose name was Noyes, and, because it is another's, leave it to suffer

This parleying with temptation is a dangerous as possible to the bounds of positive dishonesty, Prison or on the Gallows .- N. Y. Observer.

Spontaneous combustion .-- The Virginia Free Press relates an instance of spontaneous combustion in a spit-box which had been filled with saw self; what part of your name might I then take dust. The room in which it was placed was found full of smoke, and the bottom of the box was burnt through. It was satisfactorily ascertained that not a spark of fire had been in the ing of saw-mills and carpenter's shops, where moist saw-dust has been swept into a heap.

The canvass cover of a cart at Mount Pleasant, Virginia, which had been newly painted, afterwards wet by a shower and rolled up, took fire Horticulture in an enlarged view .- At the annual recently and was almost entirely consumed, mak-

> The Kurbut, or Great Flower of Sumatra, discovered by Dr Arnold, in 1818, is one of the most extraordinary of vegetable productions. It is a parasite, growing out of another plant, in the manner of the mistletoe, and is found in woods, on the roots and stems of those immense climbers which are attached, like cables, to the largest trees in the forest. The flower constitutes the whole of the plant, there being neither leaves, roots, nor a stem. The breadth of a full grown flower exceeds three feet; the petals, which are subrotund, measure twelve inches from the base to the apex; what is considered the nectarium would hold twelve pints; the pistils, which are abortive, are as large as cows' horns; and the weight of the whole is about fifteen pounds. The flower fully blown, was discovered in a jungle, growing close to the ground, under the bushes, with a swarm of flies hovering over the nectary and apparently laying their eggs in its substance. The color of the five petals is a brick rcd, covered with protuberances of a yellowish white. The smell is that of tainted beef .- Magazine of Natura! History.

Some of the Glovers in England have presented a petition against the importation of Gloves.

THE NEW AMERICAN GARDENER. A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific England Farmer, with the assistance of a number of accounts and Practical Hurticolturalists in the vicinity of Boston and New York, is just published by J. B. Russell, Proprietor of the New England Farmer. The articles are arranged alphabelically, and comprise the most useful Vecetalize and Friedrich or the Comprehension of the Comprehension o in the climate of New England and the Middle States; as well as a Treatise on Flowers, and on Landscape or Picturesque Gardens, on the general management of the Silk Worm, and the manufacture of \$11.K, and a Treatise on the culture of GRAFZ VINES and the STRAWERRY. The strike on Trees rotation as a cumuration and description of all the Apples-Pears, Peaches, Cherries, Plums, Necturines, Apricots, &c. &c. that can be raised to the most advantage, and their relative forwardness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically acquainted with the subjects on which they have written,

A list of the contents of the work will be found in the New

England Farmer for August 1.
Price \$1.25-Six copies for \$6.00.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subcribing, are entitled to a deduction of fifty cents.

EW ENGLAND FARMER.

Published by John B. Russell, at No. 52 North Market Street, (over the Agricultural Warthouse).-Thomas G. Fessenden, Editor.

VOL. VII.

BOSTON, FRIDAY, SEPTEMBER 12, 1828.

No. 8.

AGRICULTURE.

Flemish husbandry. - The Flemings, or inhabitants of Flanders, in the kingdom of the Netherlands, are celebrated for frugality and economy in farming, and for judicious modes of culture. A late traveller says: "The country is a positive garden, and presents a most luxuriant appearance; the fields are streaked with all the colors of the rainbow. You will see, belonging to the hay, bright yellow colesced, pink and white clover, light blue flax, rye, wheat, barley, oats, and large plots of crimson poppies."

Colesced (or rapeseed) is extensively cultivated in Flauders, France, England, &c. for the production of oil, and some agriculturists consider it one of the most profitable crops in husbandry. The produce on good land, in favorable seasons, is from 40 to 50 bushels per acre. The seed is sold ery in some districts. Four gallons of seed yield one gallon of oil. The straw is eaten by eattle. We believe that much of the oil imported into the United States from Europe, and sold here as linseed oil, is the produce of the rape or colesced.

The poppy is cultivated on the continent of Europe as an oil plant, and the oil is esteemed in domestic economy next to that of the olive, being used for salad oil. The seed is sown at the rate of one gallon to the acre, and the average produce on rich soil is about 30 bushels per acre.-Five gallons of seed yield one gallon of oil. The poppy is harvested by shaking out the seed upon sheets laid along the rows .- Hamp. Gazette.

TO AGRICULTURISTS.

It has been stated to us, that, some eighteen months ago, a gentleman of this state, feeling desirous to ascertain whether certain productions of France would thrive in New-England, sent to that country for a variety of fruit trees. Choice varieties, consisting of apricots, quinces, nectarines, peaches, apples, pears, cherries and plums, were accordingly removed, in January, 1827, and shipped to New-York, where they were landed in March following. In the month of April, the gentleman planted these trees upon his farm in the neighbouring town of Northford; and in October of the same year, many of them produced perfect fruit. We are gratified to learn that at the present season these thrifty trans-Atlantics appear healthful and promising .- New-Haven Journal.

IRON.

Since the enactment of the tariff bill last winter it has become a desideratum to ascertain the probable quantity of iron manufactured in the United States, and particularly in Pennsylvania. As there is much diversity of opinion on the subject, we have contributed our mite to ascertain the quantity of iron manufactured in Schuvlkill county .-The statistics of the United States, in this most essential branch of manufacture, is of importance, because we verily believe, the supply of the country is abundantly sufficient for its consumption.

The iron works in Schuylkill county are Greenwood Furnace and Forge; the Schuylkill, Bruns-

forges which are now being built, one at Mahan-formed: thus about Lancaster, and at Harrisey, and the other at Swatara. Five hundred tons bargh, a small town on the Susquehannah, where of bar iron may be made by these four furnaces a considerable tyade is carried on in wood that is new in operation annually. Greenwood works brought down the river, those trees are reputed are owned by Messrs. John and Benjamin Pott, who arry them on extensively and we believe profit bly. They are the only persons engaged least valuable are those with a white heart. From in the business of these works. The ore for their for ace is obtained from the neighborhood of bably, arises from a difference of soil, are derived same proprietor, fine green pastures, new mown Portsgrove and Reading, and is transported to the furnace on the canal. The price of bar iron is \$40 per ton at their forge. The price of pig is \$23 per ton at the furnace, of which twenty tons a week can be melted .- Miner's Journal.

Peach pies .- The season of peaches having arrived, we again publish the recipe for the best fruit pie that can be made. Place your paste in from a difference of soil," it is not impossible that a deep plate, as for other pies-then, having wipfor crushing, or is crushed by the farmer himself; ed your peaches with a cloth, put them in whole, an oil mill being a common appendage to a farm- and spread upon them sugar sufficient to sweeten tance. them well, then cover close with paste and bake till the fruit is sufficiently cooked. The stones of shipwrights use as much locust-wood as they can the peaches are sufficient without any other seasoning, and are better than any other. If the fruit is good, there will be so much of the juice on than the one, and lighter than the other." opening, that it will be necessary to serve with a

From the New American Gurdener.

LOCUST-TREE. - Robinia pseudo-acacia. This tree is a native of the United States.

Method of cultivation .- "It is capable of being raised from the seed, cuttings, layers and suckers; but the seed method is said to afford the best plants. The seeds should be sown about the end of March, or beginning of the following month, on a bed of light mould, being covered to the depth of about half an inch. The plants usually form plantations of locust. In Virginia, I have appear in the course of six or eight weeks. They sufficiently strong, should be set out in the spring or autumn, in nursery rows, for two or three for final planting."-Rees' Cyclopedia.

Dr. Drown, of Rhode-Island, says, that "The easiest method of raising the locust is as follows: Plant fifteen or twenty trees on an acre, and, when fifteen or twenty feet high, run straggling furrows through the ground, and, wherever the roots are cut with the plough, new trees will start by from the American coasts by constant consumpful growth."

Use .- It is observed in the North American Sylva, a celebrated work, by F. Andrew Michaux, that "The greatest consumption of locust wood is for posts, which are employed in preference for the enclosing of court-yards, gardens and farms, in the districts where the tree abounds, and the circumiacent country. They are transported for the same use to Laneaster, Baltimore, Washington, Alexandria, and the vicinity. When the trees

wick, and Pinegrove Forges, besides two new tain differences in the tree- from which they are the best whose heart is red; the next in e-teem are those with a greenish-yellow heart; and the this variety in the colour of the wood, which, prothe names of red, green, and white locust. In the Western States, there is a variety which is sometimes called black locust."

It is probable, that the locust with a "greenish yellow heart," spoken of by M. Michaux, is the same with that which Mr. Briggs calls the yellow locust; and although M. Michaux supposes " this variety in the color of the wood probably arises there may be permanent specific differences in the several varieties. It'so, the discovery is of impor-

M. Michanx says, "In naval architecture, the procure. It is as durable as the live oak and the red cedar, with the advantage of being stronger

With regard to the insect which destroys the locust, M. Michaux says, "Within eighteen or twenty years, an obstacle has unhappily appeared, which will contribute greatly to prevent the multiplication of the locust in all the anciently settled parts of the United States; this is a winged insect, which attacks the tree while standing, penetrates through the bark into the centre of the trunk, and, for the space of a foot, mines it in every direction, so that it is easily broken by the wind. This inconvenience is already so serious, as to induce many people to forego all attempts to not learned that trees of the natural growth have should be well weeded and watered, and, when been visited by this destroyer, but those that have been reared about the plantations have already telt its ravages. This evil, which it appears diffiyears, in order to remain to have a proper growth cult to remedy, will be more sensibly felt when the destruction of the forests now on foot, an inevitable consequence of the neglect of all measures of preservation, shall force the inhabitants to have recourse to plantations, which they will wish to form, in a certain proportion, of the locust .-Hence it may result, that, disappearing successiveup, and will soon stock the ground with a plenti- tion, and not being reproduced on account of the insect, the locusts will become extremely rare in their native country, and abundant in Europe, where no similar catastrophe forbids their propagation."

The Massachusetts Society for the Promotion of Agriculture have offered a premium of fifty dollars "for a mode of extirpating the worm that attacks the locust-tree, which shall appear to the satisfaction of the trustees to be effectual."

The following, copied from a report of a comare felled in the winter, while the circulation of mittee of the Essex Agricultural Society, on farms the sap is suspended, and these posts are allowed in Essex county, Mass., (published in the N. E. to become perfectly dry before they are set, they Farmer, vol. iii. p. 145.) places the advantages to are estimated to last forty years. Experience has be anticipated from the culture of the locust in a shown that their duration varies according to eer- fair, and, we believe, just point of view.

entirely by reason of planting and permitting a easily done, after a few trees have taken root, and taking care that horned cattle do not go upon the land while the trees are young In addition to the increase of feed, the trees themselves are well worthy of cultivation. No growth is more ed whether an acre of land can be made to yield more in the course of twenty-five or thirty years, without the application of any manure, than by be obtained in this time would be from three to six hundred, worth from fifty cents to one dollar each. The increase of feed and surplus wood would fully pay the labor of cultivation; so that the land.

" An objection to the cultivation of the locusttree is often brought from the fact that they are the estimation of the physicians of the present day. sometimes destroyed by worms. This is true; but the ravages of this insect are found to be greatest where the trees are few and scattered .-In the grove on this farm, which extends over a number of acres, and in the other groves in the dance in warm countries or warm seasons, being vicinity, but very few of the trees are at all injured by worms. This objection is by no means sufficient to authorize the neglect of their cultivation. It certainly is of the highest importance to the their pastures; or, rather, how they can save come bilious." them from ruin; for it must be obvious to all, Mr. Bartlett, or in any other way, they can be re- vending it .- Hunterdon, N. J. Gazette. claimed, it surely is worthy of the experiment."

From Sincloir's Treatise on Grasses.

ORCHARD GRASS.

This grass appears to have a greater variety of merits than almost any other grass. It soon ar- the system. rives at maturity; it hears cropping well, is very productive, and its nutritive powers are considerable. It is much less impoverishing to the soil than rye-grass, and when ploughed in affords a greater quantity of nutritive matter to the soil. It has been objected to Orchard Grass, that it rises in tufts, and is apt to become coarse. But the objections will apply to every grass that is not sown sufficiently thick to occupy with plants every spot of the ground, and that is not sufficiently stocked to keep the surface in a succession of young leaves. It is the practice of thin sowing, and the strong therefore thought preferable to several in the Alternate. Husbandry, there is scarcely a species to be preferred to the Orchard Grass. But with res-

"A practical illustration of the advantages of bination of many. It will likewise be found, that cultivating the locust tree presented itself on the the Orchard Grass, from its more numerous merfarm of Dr. Nichols. Several acres, that were, a its, should substitute three parts of a mixture of few years since, barren and gravelly pastures, are grasses adapted for the purposes of Alternate Husnow covered with a good coat of grass, almost bandry. The different species most proper to combine with Orchard Grass, are such as possess growth of locust trees upon the land. This is in a greater degree the properties of which this grass is deficient. For this purpose, none appear either from the seed, or by being transplanted, better fitted than the Hard Fescue, Meadow Fesone, Timothy or Herd's Grass, Rye-Grass, and White Clover, which should be in a smaller proportion. A combination thus formed, of three parts Orchard Grass, and one part of these species rapid, and none more in demand, or of greater just mentioned, will secure the most productive value when arrived at maturity. It may be doubt- and nutritive pasture in alternation with grain crops, on soils of the best quality; and even on soils of an inferior nature, under the circumstan- phthisic, shortness of breath, consumptions, &c. ces of unfavorable seasons, will afford nutritive planting it with locust-trees. On a fair computa- herbage, when otherwise the land would have tion, the number of serviceable posts that might been comparatively devoid of it, if one species of grass only had been employed.

FRUIT.

As soon as the warm weather commences, edithe proceeds of the timber would be the profits of tors begin their caveats against the use of fruits. A prejudice of this kind existed about two centuries ago, but we believe it is entirely exploded in Tourtelle in his "Principles of Health," (a treatise pronounced by Haller, the best work on the prophylaxis morborum extant in his day,) says:- "The author of nature has caused fruit to grow in abunabsolutely useful to man. Hence it happens that a kind of instinct excites the human species to seek them in preference to other aliments in these countries and in these seasons, as well as in cases farmers of Essex, to inquire how they can improve where the humoral system tends strongly to be-

It would rather become editors to caution their that, as at present managed, they are constantly readers against the abuse of fruit than the use of growing worse, and many of them have already it. They would thus cease to create unnecessary become of very little value. If, by planting them scruples in those who use fruit to the advantage with trees, by ploughing, by applying plaster, as of their health, and no longer interfere with the has been done, with good success, on the farm of interests of the poor, who make a livelihood by

APOPLEXY.

General blood letting should always be preferred in the first instance to local, and it should be continued until decided effects are perceptible on

BLEEDING FROM THE NOSE.

In a very interesting case of this affection, comnunicated by the late Dr James Kent Platt, to his friend, Professor J. B. Beck. of this city, and which threatened to terminate fatally, the affusion of cold water, by pailsful over the head and shoulders, proved almost immediately successful.

BURNS.

In cases of extensive injury from this cause, one of the most successful applications, hitherto resorted to, has been the oil of turpentine. In this vicinity, and crops secured during the most reproductive powers of the plant, that occasion it the action which occurred in 1815, between the pressing seasons of business, without the use of to appear a hassocky grass. If one species only is U.S. frigate Guerriere and an Algerine frigate, intoxicating liquors; and although no society has nearly fifty noon belonging to the former were se- yet been formed here for the suppression of intenverely burnt by the explosion of one of the large perance, our intelligent farmers of their own acguns. Some of these men were in a most pitia- cord, seem to be making powerful efforts to banish pect to an early and certain supply of the most nu- ble condition, and suffered the most exquisite tor. the monster from their borders.—Ontario Repos. tritious, herbage throughout the season, it will be ments. They were taken down to the cockpit,

REMEDY FOR WHOOPING COUGH.

Take of dried colt'sfoot leaves (that have not been gathered more than a year) a good handful, cut them small, and boil them in a pint of spring water, till half a pint is boiled away; then take it off the fire, and when it is almost cold, strain it through a cloth, squeezing the herb dry as you can, and then throw it away. Dissolve in the liquor an ounce of sugar candy, finely powdered, and to a child three or four years old give one spoonful of it, cold or warm as the season favors, three or four times a day, or oftener if the fits of coughing come frequently, till well. For older or younger persons, the quantity may be increased or diminished, as thought proper.

This preparation is useful also in asthmas,

N. B. - When sugar candy cannot conveniently be had, perhaps honey or good clean brown sugar would answer. Sugar candy is, however, to be preferred.

Another .- Dissolve a scruple of salt of tartar in a gill of water; add ten grains of cochineal, finely powdered; sweeten this with sugar. Give to an infant the fourth part of a table spoonful, four times a day; and from four upwards, a spoonful may be taken. The relief is immediate, and the cure in general effected within five or six days.

Accident by becs .- As Mr. Martin Lazarus, of Salisbury Township, (Lehigh county) was employed in hauling manure, in a three borse wagon, a bee happened to light on the leader horse, whilst passing the garden tence and stung him. This started not only the leader, but also frightened the the other two horses, and in endeavoring to stop them, the wagon came in contact with the garden fence, tore it away, and upset a whole row of hives. The enraged bees all fell upon the horses and men and stung two of the horses to death, and very much injured the other, as well as Mr. Lazarus, his son, and servant. The son, in particular, was seriously injured, having been thrown between the wagon and the fence post; he is considered out of danger, however.

Paper making .- It is stated in a late London paper, that a great improvement in the art of paper making has been invented, and is about being adopted in most of the large manufactories of Great Britain. It is a powerful drying steam-machine, containing four large cylinders, through which a web, in the fullest sense of the term, passes, and obtains by the pressure a surface smooth and even in every part, and is cut to any size.

Temperance.- The frame of a new Presbyterian Meeting House, was erected in Gorham, in this county, on Thursday the 21st inst. without the aid of ardent spirits. The concourse of people was. unusually great, and yet such a degree of contentment, sobriety, and activity, was exhibited, as to

be highly honorable to our citizens.

It would ter; as long as any milky jnice exudes, the preswhich by age loses the power of reproduction .mills, they do not brnise the smut balls so much as the flail. 5. Great care must be taken, not to thresh wheat on a floor where smutty wheat has been threshed, nor to convey the seed in a sack in which swallow the sea; if these happen to be which smutty wheat has been formerly put.

On the subject of steeping, it may be proper to add, that it would be well to extend that operation to other grains besides wheat. Every sort of seed should be steeped enough to promote a quick vegetation, and to secure a more uniform growth, which would greatly improve both the quantity and quality of the grain; and if the seed of barley and oats, as well as of wheat, were clothed with saline and caustic particles, it would either preserve it entirely from the attacks of vermin, or destroy such as may venture to eat of it.

We have been informed that unslacked lime

of the quantity of ardent spirits the present, as in answers an excellent purpose for preparing wheat previous seasons, in proportion to the quantity of for seed. A gentleman states, that he put four or of Tobit's blindness being cured by the gall of a five pounds of quick lime into a sufficient quantifish, has been much ridiculed. ORIGIN OF RIVERS.

A question has long existed among philosophers, and has never been settled by universal consent, whether the rivers depend solely for their supply upon the water which descends from the atmoswater within the earth, like that of the blood in sources of fountains, rivers and larger springs, by starch .- Dary's Elements of Agricultural Chemiswhich these are supplied; and this opinion is corroborated by the known existence of Charybdes, stopped, the largest rivers have been said to be dried up, and wholly ceased to run for a considerable time. It is stated in Rees' Cyclopedia, that there are accounts in history of this having happened to the Thames, the Medway, and the Trent, in England; the Elve, the Motala, and Gulspang, in Sweden; and other rivers in other On the contrary, if these Charybdis countries. happen to be too open, fresh water springs depending upon them become salt. Pliny relates, that this once happened in Caria, near Neptune's Temple. Various other instances have been stated by historians, ancient and modern.

SILK.

the Fifth Age, that is, until the Cocoon is perfected. Continued from page 51.

The fifth age can only be looked on as terminated, when the cocoon is perfected.

The cleanliness of the feeding frames in these to preserve the health of the silk worms.

About the tenth day of the fifth age, the worms attain perfection, which may be ascertained by the following indications:

Ist. When, on putting some leaves on the eating them, and rear their heads as if in search of something else.

2d. When looking at them horizontally, the light shines through them, and they appear of a whitish yellow transparent color.

3d. When numbers of the worms which were fastened to the inside of the edges of the wickers, and straightened, now get upon the edges and move slowly along, instinct urging them to seck change of place.

4th. When numbers of worms leave the centre of the wickers, and try to reach the edges and crawl upon them.

5th. When their rings draw in, and their greenish colour changes to a deep golden hue.

6th. When their skins become wrinkled about the neck, and their bodies have more softness to the touch than heretofore, and feel like soft

7th. When in taking a silk worm into the hand, and looking through it, the whole body has assumed the transparency of a ripe vellow plum. When these signs appear in any of the insects, every thing should be prepared for their rising, that those worms which are ready to rise may not lose their strength and silk in seeking for the support they require. Handle the worms at this stage with the greatest gentleness, as the slightest pressure injures them. When moved, they should be left on the twigs or leaves to which they are fastened, to prevent their being hurt by tearing them off. A blunt hook should be used to take up those not adhering to leaves or twigs.

Preparation of the Hedge.

A week or ten days before the worms are ready to mount, bundles of twigs of chesnut, bickory, oak, or of the birch of which stable brooms are made, must be procured, prepared, and arranged in bunches, so that the worms may easily climb up them, to work their cocoons. As soon as it is observed that the worms want to rise, the bundles of twigs must be arranged on the feeding trays, leaving fifteen inches between them. The top branches should touch the lower part of the tray above that on which they are placed, so as to form an arch-and be placed a little aslant, that the worms when climbing may not fall off. The branches should be spread out like fans, that the air may penetrate through all parts, and the worms work with ease. When the worms are too near one another, they do not work so well, and form double cocoons, those which are to be reeled. 5th. Those of a which are only worth half a single round cocoon. looser texture. Leave openings at the tops of the curves, for the worms to form their cocoons in.

As soon as the worms are prepared to rise, the feeding frames should be cleaned thoroughly, and the apartment well ventilated. Put the turn of an anniversary festival, which exhibits aworms which are ready to rise near the hedg- gain an abundant crop of splendid flowers and

ending when the Moths appear.

The following are the necessary things to be

I. To gather the cocoons.

II. To choose the cocoons which are to be preserved for the eggs.

III. Preservation of cocoons until the appearance of the moth.

I. Gathering of the Cocoons.

Strong, healthy, and well managed silk worms, will complete their cocoons in three days and a half at farthest, reckoning from the moment when they first begin casting the floss. This period will be shorter, if the silk worms spin the silk in a higher temperature than that which has been indicated, and in very dry air.

It will be better not to take off the cocoon bcfore the eighth or ninth day, reckoning from the time when the silk worm first rose. They may be taken off on the seventh, if the laboratories have been conducted with such regularity, that the time may be known with certainty, when this may be done.

Begin on the lower tier of hurdles, and take the cabins down gently, giving them to those who are to gather the cocoons; place a basket between two of the gatherers, to receive the cocoons; another person should receive the stripped bushes, which may be laid by for another year .-All the cocoons that want a certain consistency, and feel soft, should be laid aside, that they may not be mixed with the better. Empty the baskets upon hurdles or trays placed in rows, and spread the cocoons about four fingers deep, or nearly to the top of the feeding frame. When the cocoons are detached, the down or floss in which the silk worms have formed the cocoon, should be taken off. If the cocoons are for sale, weigh them, and send them to the purchaser. The baskets, the floor, and all things used, should be cleaned.

When gathering the cocoons, make four assortments:-1st. Those designed for breed. The dupions, or double ones. 3d. The firmest of

When the cocoons have attained that rich staple from the combined power of

The heroic or fabulous records of ancient Sixth Age, beginning in the Chrysalis State, and Greece hold yet in celebrity the naval expedition of Jason with his Argonauts, to the nearest spot or rendezvous of Asiatic merchants (Colchis), in order to obtain or to conquer the Golden Fleece, suspended on a tree guarded by a dragon! than which allegory none could more explicitly designate a treasure of silk, appended on the parent tree, under the keeping of the Seres or Chinese, the original proprietors, and protected by the Dragon, the ancient and everlasting Flag of that nation!

However hidden, then, and long after the art of raising silk remained to the Greeks, we find that they manufactured it in the Island of Cos, whether with their own or with foreign materials.

As for the Romans, their ambition ever was turned to conquest and dominion-in fact they became possessed of all the treasures of the world, among which silk is mentioned, even as the most extravagant article of luxury. One of their emperors thought it was too expensive as the material of a garment of his empress, while matrons and courtezans of that most corrupt capital exhibited themselves ornamented with it .-Poets and satirie writers reprobated it, until an imperial decree forbade it to the mule citizens as an efferimate and unmanly bodily decoration .--But the more sober people of the Greek empire, who during several long periods cultivated the useful arts, were soon taught by useful Christian missionaries how to foster and promote the culture of silk, which was extended all over the luxuriant and fertile banks of the Bosphorus; since which period it has kept pace with the influence, ascendency and dominion of powerful governments. The Caliphs of Mahomet, even after they had extended their conquests on the coasts of the Mediterranean Sea, planted the numberry in the Morea, in Spain and in Sicily.

From the last, Charles the IXth of France. having conquered Naples, at the head of his knights, enobled his triumphant return home with the mulberry and silk-worm seeds.

In fine, the acquisition became completely appropriated to the most favorable districts of his kingdom, under Henry the IVth, one of the best of kings, with the help of his truly honest minister, Sully. Every peasant and country farmer could boast of a well tenanted barn-yard, of a fig tree shading his door, and a mulberry in his ave-

Excuse, Mr. President, this historical digression,

if, in continuation of it, your name and that of this Horticultural Society be added to it, by fostering and encouraging the culture of the mulberry, so necessary to the introduction of the domestic staple of silk. To effect it, it must be general, and not be left to private speculation or monopoly.-The growth of silk is not involved in any secret or mystery. Aged women and children can be adequate to all its cares and tasks, under the dictates of domestic economy. Thus it has been flourishing and established among great nations. One only which could not assimilate it to the asthis precious produce, and has become the rival of other nations. I give, Mr. President-

The continuation of the labours of the Hortienltural Society of New-York-And as they have promoted domestic comfort and happiness, they will also secure commercial industry and economy.

From the Middletown (Conn.) Sentinel.

MOHAWK BRIAR.

The correspondent who favored us with the following notice of a valuable remedy for sores, (either inflamed or not) accompanied it with two specimens of the vines-the larger kind which loses its leaves in the fall, and the smaller which retains them, in all their verdure, until the month of March. They run on trees, bushes, &c. and as the leaves bear some resemblance, they would, at a short distance, be mistaken for grape vines. The stem or vine has great numbers of thorns on them, three-eighths of an inch in length. If, as our correspondent states, it possesses such invaluable healing properties-of which he has had actual experience-it should surely become more generally known and appreciated. It is common in that part of our town called "Upper-houses." The leaves only are to be used, and in their natural state, without any preparation whatever .-They are cultivated, in some parts of our town, as ornaments around the house. Any gentleman who wishes to see a specimen of the vine and leaves, can do so by calling at our office.

duly attended to, would, in thousands of cases, It is very desirable that more competitors should save much expense to many persons, and relieve present themselves for premiums for the best butthe patient from much pain. Apply the leaf of ter and cheese, than appeared the last year; these the Mohawk briar, or as it is sometimes called the premiums are \$20 for the best, and \$10 for the Walkley briar, or Green Briar, as a dressing to next best. These liberal premiums ought surely any sore, however inflamed and painful, it very soon gives relief, removing the inflammation more effectually than any poultice I ever new applied, as is required by the printed directions. the leaves to be changed as occasion requires .-The leaves being smooth as glass, never stick so of cheese presented, each was of good quality, and as to pain or trouble. They are beyond doubt it was rather difficult to determine which was the the best dressing to follow blistering that can be best, yet two of the competitors received the very applied.

The briar grows like the grape vine in clusters, colored berry, on which partridges are fond of feeding in winter. A smaller species grows more thin and scattering, and are equally valuable, holding the leaf green until March. They are found in swampy lands, inclining to sandy plains. Any person who may make a thorough trial of them, will value them highly.

number of Clergymen in New-England at the article would command in the Boston market. commencement of the Revolutionary War, was about seven hundred.

ASHES.

Leached ashes are much used, in some parts of the United States, as a manure. Great quantities are annually taken from the city of Philadelphia to Long Island, for the purpose. They cost here 40 cents per one horse eart load, and commonly bring one dollar fifty cents, when delivered. From a paper in the first volume of the New York Agric. Society Trans. by Mons. E L'Hommedieu, it appears, that ashes are found to succeed best on dry loamy lands, or loam mixed with sand. It is considered as the cheapest manure that can be properity of its climate, has nevertheless established cured. Ten loads of this manure, on poor land, a great empire by the means of manufacturing will produce ordinarily twenty-five bushels of wheat, which exceeds, by five dollars, the expense of the manure; and the five dollars pays for the expense of labor in raising the crop. The land is then left in a state for yielding a crop of hay of between two and two and a half tons per acre, which it will continue to do for a great number of years. No manure continues so long in the ground as ash- es, not only for boots of stages, but for carpeting,

> pay all the expense of clearing their land by the ashes of the wood burnt on it. One bushel of the security of the mails." field ashes of oak, is worth 121 cents. Of hickory 18 cents. One bushel of house (hearth ashes,) of oak is worth 18 cents; of hickory 25 cents at this day, (1819.) A bushel of good oak ashes yields about 4lbs, of potash, of hickory ashes about 6lbs.

It is surprising all new planters do not pursue the same economical plan. The askes are mixed with one fourth of good lime, and leached. The ley is evaporated into potash in large cast iron boilers .- T. C.] - Domestic Encyclopedia.

From the Newburyport Herald.

ESSEX AGRICULTURAL SOCIETY.

annual exhibition on Thursday the 25th of Sept. inst. near the lower meeting house in West Newbury, to commence at 9 o'clock, A. M. This Society has been liberal in bestowing premiums on the various objects exhibited, and it is hoped the Mr. Starr,-The following simple remedy, if next show will surpass any which has preceded it. to induce the farmers to avail themselves of this offer by exhibiting such quantity of each article

At the last show there were but three parcels liberal premiums of 20 and 10 dollars.

A FARMER.

A BEAUTIFUL, NEW AND USEFUL INVENTION.

We have in our possession, and shall be glad to exhibit, a beautiful and robber proof travelling trunk, made of a new material, which is thus described in the specification of the patentee:

"This cloth is made of benn and wire, which is soun together, wove and twilled in the same way that all other cloths are. The hemp is twisted tight round the wires, and they are woven together in the same manner in which the common bagging is made. It may, however, be wove tight or open, to suit the purposes for which it may be required, and after this operation it should. in all cases, be painted on both sides; this serves to prevent the hemp from rotting, and the wire from rusting. You may, if you please, put many coats of paint upon it, (suited to the object,) which will make the surface solid, smooth and elegant. This cloth may be used for many purpossacking bottoms of bedsteads, fancy chairs, sofas. [In New York state, the back country farmers pannels, (or in fact hodies,) or roofs of carriages. baskets, water buckets, for travelling trunks, or

There would really seem to be no end to the durability of whatever is constructed of these materials, and we know not why they may not be applied to all the objects enumerated, as well as to various others. The trunk, while it is completely impenetrable, is lighter than the ordinary trunk. We really think that editors of papers would benefit the public by the notice of this invention, whilst they would assuredly serve a very worthy citizen, by contributing to bring his valuable invention into immediate use .- . Imerican Farmer.

NEW INSECT.

ESSEX AGRICULTURAL SOCIETY.

The Essex Agricultural Society will hold their the West India Islands, and was formerly supposed to be a fossil, has been proved by the researches of the Rev. L. Guilding, to the nidus of a living insect. This new insect which is supposed a parasite on the great ant of the West Indies, is remarkable, as not being provided with a mouth, its food being conveyed through a tube in each of the four claws. The animal also has the power of throwing out long filaments from its body in dry weather, supposed to be with the view of attracting meisture for its preservation. An interesting paper was recently read, describing this insect, by Mr Guilding, before the Linnman Society.

> New Agricultural Journal .- Blackwood, the well known publisher of Blackwood's Magazine, has recently issued a Prospectus of a Quarterly Journal of Agriculture, which will not only be enriched by the Prize Essays and Transactions of the Highland Society of Scotland, but receive the contributions of the ablest Agriculturists in the Kingdem.

A good day's work .- Mr. Joseph Osborne, of Centre township, on Tuesday last walked three miles from home, mowed three and a half acres of meadow, and returned home again in the evening. There were upwards of two and a half tons of hay on each acre, a great part of which was badly lodged, and some lying tlat on the ground. The meadow was clean mowed and ent close. All this was done without the use of a drop of spirituous liquors. Who can beat this? - Indiana, (Penn.) Whig.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 12, 1828.

LUCERNE.

Mr. DAVID BEAL of Kingston, Ms. informs us that he sowed two lbs. of Lucerne in the spring of 1827, which yielded him two heavy crops the first season. It was sowed with oats, and red top .-In 1828 it was mowed on the 20th of June-on the 11th of July the second crop was cut, when it was 21 inches high, having grown I inch per day, since the first mowing. It grew rapidly for the third crop, and was in flower, when circumstances obliged him to turn the field into pasture. Horses, Cows, and all kinds of stock give it a decided preference to other grasses.

TURNIP ROOTED CABBAGE.

Mr. Cornelius Cowing, of Roxbury, has left at the New England Farmer office a root of the Arabian Kohl Rabi, or Turnip Rooted Cabbage, which has a solid bulb 17 inches in eigeumference.

This curious variety of cabbage is a native of Germany, where it is much cultivated. They take it up before the frost sets in, and protect it like potatos or turnips, for winter use. The produce is nearly the same as that of Swedish turnips, and the soil that suits the one is equally good for the other. It may either be sown in drills, or raised in beds, and transplanted like cabbages; in this case, the beds require to be made and sown the produce a sufficiency of plants for one acre of ground. The stem is swoln like a bulb, and when divested of the leaves may easily be mistaken for one. Hares are so fond of it, that on farms where these animals abound, the culture of this plant is first introduced kohl rabi into England from Germany. Messrs. Gibbs and Co., seedsmen to the mixture must be frequently stirred. Board of Agriculture, raised in one year, one ton and a quarter of the seed, and continue to supply made with chalk, or white argillaceous earths. the demands of the public for it, and for all other

SPOFFORD'S GAZETTEER.

We have taken a cursory view of a work recentiv from the press of Charles Whipple, of Newcontaining a General View of the State, with an Historical Sketch of the Principal Events from its Settlement to the present time, and Notices of the several Towns, alphabetically arranged. By JEREMI-AH SPOFFORD, Counsellor of the Massachusetts Medical Society. With a Map of the State. It appears to be the result of much labour and research, and if rated by the scale of utility, will be found not only in the library of every man of letters, but on the book shelf of every farmer and mechanic in Mas achusetts. The author has well observed in Europe and America; and it would be easier in the eastern parts of the State to find persons, and especially youth, who could describe with geographical accuracy, the Nile or the Ganges, than those who would give a telerable account of the Hoosic or Housatonic." This ignorance of the topography of our own State and neighborhood,

so justly animadverted on, might heretofore find municate all the information we can at present an apology in the want of those means of infor- command on this subject; and hope it will attract mation, which this book is calculated to supply; the attention of those of our friends and corresand knowledge as well as charity to be most useful should begin at home.

PAINTING IN MILK.

Skimmed Milk four pounds, or half gallon,

Lime, newly stacked, six ounces.
Linseed Oil, or Neat'stoot Oil, four ounces, or one gill. Spanish Brown 1 and a half lb. Venetian Red 1 and a half lb.

Put the lime into an earthen vessel, or mto a clean bucket, and baving poured over it a sufficient quantity of milk, add gradually the oil, stir- goes its transformation, and becomes a chrysalis: ring the mixture with a wooden spatula; then nor does it leave the grain, till a perfect insect, pour in the remainder of the milk, and dilute the Spanish brown with a part of the milk. Milk skimmed in summer is often curdled, but this is of no consequence for the present purpose.

The milk must not be sour, because in that ease preceding antumn. Two pounds of the seed will it would form with the line an earthy salt, susceptible of attracting the humidity of the atmosphere. The lime is slacked by immersing it in water, from which it is taken that it may be suf- in two hours time you will find all the weevils fered to effloresce in the air. The Spanish brown upon the cloth, which must be carefully gathered is pounded, and earefully strewed over the surface up, that none of the insects may escape, and then found to be impracticable. Sir Thomas Tyrwhitt of the liquid: it gradually becomes impregnated immersed in water to destroy them. Domestic with it, and falls to the bottom; consequently the Encyclopedia.

The above quantity will be sufficient for twenty agricultural seeds of the best quality. 64 dr. of five yards of the first coating. Resinous painting the bulb of kohl rabi afford 105 grains of nutritive in milk, for painting out door objects, add to the foregoing composition for painting in milk:

Slacked Lime, Each two ounces. White Turpentine,

Put the turpentine into the oil, which is to be buryport, entitled A Gazetteer of Massachusetts: added to the liquid milk and lime; in cold weather the milk and lime must be warmed. Any color can be given by substituting whitening or any dry colors, chalk, ochres, &c. &c. for the Spanish brown and Venetian red.

WEEVIL IN WHEAT.

MR Frssenden-The season for sowing wheat is near, and that section of the country, lying on the east shore of Lake Champlain, has been much troubled with the insect called the Weeril, a small brown insect, which eats into the kernel; and has partially, and in some cases wholly destroyed pieces of and put in hins. Mr L. Hommedieu found that a wheat. As we have not been troubled with them before this sprinkling of lime with wheat infested with them his preface, " Excepting the few who have met in season, please, Sir, inform through the oredium of your paper, in his bin soon drove them away. The lime can the Legislature, the inhabitants of Berkshire and whether we shall be subject to them the next season in conse- be afterwards winnowed out. Barnstable, or of Hampshire and Essex have been panence of having had them this; or whether seed wheat which less known to each other than the Inhabitants of has some of them in it would be more liable to them than old seed, which was raised before they came about, and any other information which you may know of them, which may be uscful to those unacquainted with the insect, and oblige

Yours, with much respect. HARVEY DEMING.

Salisbury, (Vt.) Aug. 26, 1828.

Remarks by the Editor .- We are happy to com-

pondents who may be able to prescribe some remedy against the ravages of the insect.

The Weevil or Cornchafer, Curculio granarius Mr. Fessenden-I enclose to you a recipe for is "a species of insects bearing a resemblance to as they find means to introduce themselves, while small, into grains of wheat, and there fix their abode. It is very difficult to discover them, for they lie concealed within the grain, grow slowly, and enlarge their habitation, in proportion to their size, at the expense of the interior meal, on which they feed.

"Corn-lofts are frequently laid waste by these numerous insects, which devour immense quantities of grain. When the cornchafer, after having consumed all the meal, has attained its full size, it remains within the grain, hides itself under the empty husk, and subsists alone; there it underwhen it makes its way through the husk.

"The Society of Meaux in France has invited all those who may think proper to make use of the following very simple method of preserving grain from Weevils, and other insects, to communicate the result of those trials.

"Soak cloths, made of flax, in water, wring them and cover your heaps of grain with them;

M Duhamel has observed that a considerable This process is applicable to any kind of paints heat is necessary for hatching the eggs of the weevil, and that this insect cannot breed in granaries that are well ventilated. To prevent this he made repeated experiments, the results of which made it evident that this insect cannot multiply in grain that retains a proper degree of coolness, which it may be made to do by frequent ventilating. When grain is agitated in a sieve fine enough to retain it, the weevils contract their legs, and are, in that position, so much smaller than the grain, that they drop through the sieve.

The Farmer's Assistant observes that the weevil is " a little black bug, very destructive to wheat, either in barns or granaries. On thrusting your hand into a bin of wheat infested with them, considerable warmth will be felt; but as they are usually collected together, every part of the heap. or bin should be examined.

"There are various ways of keeping wheat clear of this insect, after it has been threshed out

"Sulphur or snuff put up in little papers or bags, and properly distributed among the wheat in the bin, will keep them out, or drive them out when they have got possession.

" A plant of benbane has the same effect; and so have the leaves and wood of the Lombardy poplar. A bin made of the boards of this wood will never have a weevil in it.

"Take wet linen cloths, and lay them over a

heap or bin of wheat, with weevils in it, and they cloths; when by dipping these in water again, the insects are readily destroyed.

"They may also be sifted out of wheat, by a sieve which will let them through and retain the

"It would seem that the readiest way to keep them out of mows of wheat, before threshing, would be to mix little pieces of Lomhardy poplar every where through the mow in laying the sheaves away. Perhaps common salt is as offensive to this insect as to most others; and if so, to sprinkle some among the sheaves, when laying wheat down, might answer the double purpose of keeping out the weevil and improving the straw for fodder

An article on the subject of the weevil, by N. & N. Nixon first published in an Obio paper, and republished in the New England Farmer, vol. iv. page 228, contains the following observatious.

"The inquiry of almost every farmer is, 'How shall we preserve our wheat from the weevil.'-We answer, thresh it immediately, clean it from the chaff, spread it in a barn or open room, and it it acquires the least warmth stir it daily. We have now several thousand bushels of wheat on hand, which was threshed from the shock and from the stack before the weevil commenced its ravages. It has been lying in garners near sixty days, and has been kept cool by frequent stirring; the weevil has not touched it, and we have no hesitation in saying, let their ravages be what they may in the stack, wheat thus cleaned and kept cool, will, iu all cases be free from the flying weevil.

"We believe they are produced from an egg, which after being laid in the grain, requires a certain degree of heat to produce animation. That portion, which is produced by the straw in the stack, during the summer and fall, appears to be nature's choice. It is against that portion of heat we would have the farmers to guard, when we advise them to thresh and keep their wheat cool. Whether the egg is deposited in the field or in the stack, we pretend not to say, but we have rather concluded in the latter; but we can with safety that heat to which nearly all wheat in the stack is every house-holder, by using the saw instead of subject, whether it contains the egg or not, has cently received from the stack, ceases to hatch, or quence." in any wise produce them as soon as we can get it perfectly cool.

present crops to thresh and clean them immedi- under hay stacks, or in a hay mow. ately; and those who would hereafter effectually guard against the flying weevil, we advise to thresh from the shock, or before the wheat takes the sweat."

wheat, elder leaves are strewed over each layer dozen, assorted. of sheaves that it will entirely secure the wheat | T The Bull calf, of the Short Horned breed, lately advergagingt the ravages of the weevil; it is further, used in the New England Farmer, is sold. stated, that if the wheat is threshed and cleaned and put into casks, and the surface of the wheat covered with elder leaves, it will likewise preserve 52 North Market Street, The writer asserts that he has not only saved his own grain by these means, but that all his neighbors who have pursued the same course Just received a few bushels of prime Gilman Spring. Wheat, have been equally successful.

Fresh .- Our River is higher than it has been will soon come out of the wheat and get upon the for several years, and is full of timber and lumber, fencing stuff, pumpkins, &c. The crops of Corn, Potatoes, &c. are entirely lost. When our paper went to press, the water was still rising at the rate of three inches per hour. Many of the stores in Commerce street have the water on their first floor .- Con. Mirror, 8th inst.

> Fallen Fruit .- Be very careful to gather all punctured or decaying fruits, whether on your trees or on the ground, and give them to your hogs. If you do not, the worms which they contain, and which have been the cause of their premature decay, will make their escape into the ground, and you will find the evils, which await their visitations will increase upon you another

PEACHES.

We are glad to perceive that our citizens are paying increased attention to the cultivation of fruit, especially the peach. No spot can be more favorable for this object, and no land is better adapted to the growth of fruit trees of any kind of fruit has hitherto been too much neglected.

Mr. Ezra Sawyer has presented us with some peaches, from his farm, (rare-ripes) of excellent flavor and very large. One measured nine inches and a half in circumference. - Laneaster Gaz.

DUTCH DAIRLES.

For the sake of cleanliness the tails of the cows are tied to the roof of the cow house while milking, and the cow houses are kept remarkably clean and warm.

SAW YOUR WOOD.

"A Farmer" says "a very considerable saving may be realized by using the saw instead of the axe in preparing wood for the fire, although very few of our common country people are aware of the fact, having never tried the experiment. A saw suitable for this business costs no 100re than an axe, is as easily kept in order, and with careful usage will last many years. A man can saw as much and probably more wood in the same time than he can cut with an axe. Scarcely any say that the wheat now on hand, which never litter is made, the wood may be all cut of an exwent through the sweat, or which never attained act length, and on the whole the annual saving to an axe, would, in the course of several years, produced no weevil; and that which we have re- amount to something of considerable conse-

MISCELLANIES.

MILITIA.

Hamilton's opinion of the Militia System forty years

In 1787, when our militia were few in number compared with the present time, Alexander Hamilton observed, " The project of disciplining all the militia of the United States is as futile as it would be injurious if it were capable of being carried into execution. A tolerable expertness in military movements is a business that requires time and practice. It is not a day, nor a week, nor even a month, that will suffice for the attainment of it .-To oblige the great holy of the yeomanry, and other classes of the citizens, to be under arms for the purpose of going through military exercises and evolutions as often as might be necessary to acquire the degree of perfection which would entitle them to the character of a well regulated militia, would be a real grievance to the people, and a serious public inconvenience and loss. It would form ar annual deduction from the productive laa thing which would abridge the mass of labor ache-there was no cure but having it out. and industry to so considerable an extent, would be unwise: and the experiment, if made, could not succeed, because it could not long continue. Little more can reasonably be aimed at, with reyear."

AGRICULTURE.

(By the Editor.)

IMPLEMENTS OF AGRICULTURE.

Every good husbandman will lay it down as a rule, to have an inventory of all his agricultural implements, and other articles, necessary for the cultivation of his farm; and frequently inspect them, that he may be sure that the requisite repairs are made in due time. An implement, likewise, that is not longer wanted during the season, ought not only to be carefully housed, but before it is put aside, it should be well cleaned, rendered perfectly dry, oiled, or, if made of iron, painted, and kent so as to be ready when wanted.

Sir John Sinclair observes that no circumstance marks more the character of an attentive husbandman than great attention to his farming implements. Upon every farm, also, there ought to be one or more places, properly constructed, for holding the larger implements; and some secure place allotted, for containing the smaller tools. Where machines are necessarily exposed in the field a great part of the season, they require to be new painted at least every second year. This defends them, not only from drought but also from rain and rust.

The introduction of new implements into a district is often a matter of great difficulty, owing to the ignorance, the prejudices, and the obstinacy of farm servants and labourers. Many farmers, therefore, very absurdly retain their old ing plements, though convinced of their inferiority, rather than sour the temper of their labourers by attempting to introduce new ones. In several cases, however, by attention, perseverance, and by rewarding those servants who have been induced to give the new machines a fair trial, they have succeeded in the attempt.

The importance of proper implements is such that the melioration of those in use would be an essential advantage to agriculture; and great as are the mechanical improvements which have been already made, many of them are capable of being brought to still greater perfection. Persons of genius and experience, therefore, ought to be encouraged to devote their time and attention to this important object; and to exert themselves, either to improve the various sorts of implements now in use, on scientific principles, or in the invention of superior ones, as circumstances may require. The discovery of an useful implement, by which the labours of agriculture can be abridge ed, or brought to a still higher degree of perfection, and the expense of cultivation at the same time diminished, cannot be too much encouraged. as likely to prove of essential service, both to the farmer, and to the public. It is calculated indeed, that an immense advantage would accrue, from even the general adoption of the improved implements now in use in particular districts. Mr Curwen is of opinion, that the farmers in the southern counties of England, lose at the rate of 25 per cent. by the heavy carts and wagons they employ; and there can be no doubt, that the introduction

GENERAL RULES FOR THE CONSTRUC-TION OF FARM BUILDINGS.

In constructing farm buildings the following rules should be attended to.

Though a circle contains most space within the smallest possible inclosure, yet with few exeptions, it is the least adapted for subdivision, and the most extensive in execution; while the square, and parallelogram, will be found the least ostly, and the most commedious.

In low buildings, where the roof and joisting are the most expensive articles, the oblong form will be preferable, particularly when such a form s, in other respects, best adapted to the purposes

The cheapest buildings are those whose plan is contained within four straight lines. All projections add considerably to the expense, by the extra corners, breaks in the roof, &c.

WATER IN FARM YARDS.

The author of Husbandry in Scotland, is of opinion that when cattle are fed in winter on dry food, as hay or straw, no expense should be spared in supplying them with a sufficient quantity of water. It has been ascertained, that a bullock feeding upon straw, having water at command, will drink of it eight times a day; bence it is evident that he cannot get enough, if only driven twice a day to an adjoining stream or pond. It is therefore, advisable, where it can be done, to bring water into a cistern in the fold-vard, to which the cattle may go whenever they are in want of it. The cistern may be made of rough masonry, and consequently would not be expensive. There can be no doubt that cattle would improve much more rapidly, more especially on coarse fare, when thus supplied with water, than if they were only occasionally driven to it.

GRATER CIDER MILL.

Of the multitude of new inventions which the ingenuity of our countrymen annually brings forth, it is unquestionably true that a considerable proportion are of but little practical utility, while others entirely supersede the modes by which the same effect was before produced. Among the latter, we have no doubt, the new "Grater Cider Mill" is destined to be ranked. We examined it last fall, and saw its operation, and are satisfied that the saving made by it, both in the power required for propelling it, and in the rapidity of execution, is very great. The apples are ground, or rather grated, very fine, so that all the juice may more readily be pressed out, while the seeds are left whole, so that they do not communicate their bitterness to the liquor. We therefore do not hesitate to recommend it to the public, and this we do entirely from our conviction of its utility, and without the solicitation of any person whatever .- Mass. Spy.

FOR THE NEW LAGIAND PARMEL.

Mr. Fessenden-I have lately been in the county of York, Mc. where a number of your subscribers-who are not half so numerous as they ought to be, for their own advantage-are desirous of obtaining information on the following subjects :- The best mode of making a syrup and a wine of the elder berry juice : The best season and mode of transplanting our native forest trees and shrubs for ornamenting the grounds about houses, roads, &c. Any information you may find it convenient to communicate on these topics, will be gratefully received, I doubt not, in the county of York, and certainly by a subscriber in Massachusetts.

By the Editor .- We are happy to comply with the request of our respected correspondent to the extent of our information, and would be obliged to friends and well wishers to the objects of our establishment for any notices relating to the topics of his inquiry.

The following recipe is transcribed from the New American Gardener. It was originally taken from an English publication. We have never made trial of it, and cannot wouch for it, though we have no reason to doubt its correctness.

To make elder-berry wine .- One bushet, when picked from the stalks, produces three gallons, or upwards, of herries; put these to seven galls. of soft water; after standing forty-eight hears, put them into the copper, let them boil one hour, then press the juice through a coarse cloth; then put the liquor into your corper again, with twenty pounds of raw sugar, half a pound of Jamaica ginger, bruised, one ounce of cloves, and one ounce of allspice. Boil the whole together one hour, then put it into a tub, and, when cold enough, add some good yest spread on a toast, and in two days put it all into a cask, and lay the bung lightly on for two months; then add one quart of brandy; this wine will keep for several

With regard to making a syrup of the juice of the elder-berry, we have seen no prescription, but presume that the process is very simple. Willich's Domestic Encyclopedia says, "The berries [of the elder] are poisonous to poultry; but their juice being boiled down to an extract, and sweetened with sugar, (this composition being termed rob.) is a gentle aperient, and promotes perspiration."

With regard to forest trees, we shall give some directions from authors of established reputation.

M. Mahon says, "Evergreen trees and shrubs may be planted with good success any time in March, in most of the Southern States: but in the Middle States it should not be attempted before the last week therein, nor in the Eastern Hair Restorative.—It has been ascertained that States before the beginning or middle of April: etation commences, which is a rule that ought to be carefully observed."

6 The first thing in transplanting trees," (says an English writer,) "is, to have the ground prepared before the trees are taken up, that so they may remain out of the earth as short a time as possible; the next is to take up the trees. In dothem off: for if they are torn out of the ground without care, the roots will be broken and bruised taken up. But it will require great care to plant downright roots.

"The next thing is the pruning of their heads, of adhesive paste. If the trees are designed for standards, you should of branches close to the place where they are which they are to be set." produced, as also irregular ones, which cross each other; and after having displaced these branches, you should also cut off all such parts of branches as have by any means been broken or wounded; but by no means cut off all the main leading shoots, which are necessary to attract sapfrom the root, and thereby promote the growth of

the tree.

"Having thus prepared the trees for planting, you must now proceed to place them in the earth. But first, if the trees have been long out of the ground, so that the fibres of the roots are dried, place them eight or ten hours in water, hefore they are planted, with their heads creet, and the roots only immersed therein, which will swell the dried vessels of the roots, and prepare them to imbibe nourishment from the earth. In planting them, great regard should be had to the na. ture of the soil; for if that he cold and moist, the trees should be planted very shallow; and if it be a hard rock or gravel, it will be better to raise a Lill of earth where each tree is to be planted, than to dig into the rock or gravel, and to fill it up with earth, as is too often practiced, by which means the trees are planted, as it were, in a tub. and have but little room to extend their roots.

"The next thing to be observed, is, to place the trees in the hole in such a manner that the roots may be about the same depth in the ground as before they were taken up: Then break the earth fine with a spade, and scatter it into the hole, so that it may fall between every root, that there may be no hollowness in the earth. Then, having filled up the hole, gently tread down the earth with your feet, but de not make it too hard, which is a great fault, especially if the ground be strong and wet.

" Having thus planted the trees, they should be fastened to stakes driven into the ground, to precoots."

ture," vol. ii. page 37, it is remarked, that "All years to my inserting the graft too early. If the evergreens are transplanted with difficulty. FOR THE NEW ENGLAND FARMER.

GRAFTING VINES AT THE ROOT.

Mr. Fessenben - I was much gratified by your republication of the letter of Mr. Coxe, of New Jersey, on the propagation of the Grape by grafting on the roots. Few mon in our country are entitled to higher respect from horticulturists, than Mr. Coxe, and every thing which comes from his pen is worthy of notice. He is right in saving that none of the European cultivators enumerated by him, none of the standard works on borticulture, have given even an intimation of the perfeetly safe and sure mode of grafting vines on the roots of other vines. But, at the same time, it is true, that Mr. Knight, President of the Horticultural Society of London, has suggested it as a secure mode, and some months before Mr. Coxe's publication, having received some grape scions from him, I inserted them into the roots of other grapes. The process I adopted was exactly the same as that of Mr. Coxe. I inserted them by cleft grafting, using no clay, but drawing up the natural soil about three inches above the insertion -out of five scions, four grew. It is a valuable discovery for our horticultural friends in the interior. They can always procure scious of the best grapes, and insert them in the roots of our native grapes, of which the country is full. The Isabella would make an admirable stock for the foreign grapes, and there is reason to hope that the more delicate grapes would flourish better on our native vines, and probably be more hardy, than on their own roots.

This, however, is only speculation-experience will decide. A correspondent of yours inquires as to the mode of grafting grapes on the stalk or stem. This, from my experience, is not a very easy or successful process; but the late Mr. PREmulch laid on the surface of the ground about the BLE was often successful in it. I have repeatedly tried it, and failed. During the present year, I where he suited himself. But the day being far

In "Memoirs of the New-York Board of Agricul- have succeeded. I attribute the failure in former several methods recommended by French writers. The two which I adopted were the following, and both succeeded :--

One is, to split the stalk of an old grape vinc "They avoid wounding the body and limbs; split open are withdrawn, the wood will embrace except the eye with clay, or, as I prefer, with a resinous compound of rosin and beeswax. I have

Take a scion with one eye only, four inches in length-leave about an inch above the eye, and " In selecting evergreen trees, care should be three inches below it - pare away about half the square-then make a corresponding cut into a grape shoot of exactly equal size, terminating in a square shoulder, upon which the scion will rest, and which it should exactly meet-secure the scion to the stalk by a bandage, and cover it as in other grafting.

It will be perceived that in both these modesthe main stalk is not eut off, continues to grow. and will not feel the wound if the scion does not take. If it takes, and is healthy, then cut off the stalk immediately above the insertion, and you will have fruit perhaps the next year.

Still the operation is a doubtful one, and I think the root grafting will eventually supersede it in this country and in Europe, except in cases where we wish to change the fruit of a vine already introdued into a grape house.

JOHN LOWELL.

Roxbury, Sept. 15, 1823.

To nursery mend it seems to me, the practice of root grafting affords some facilities which they have not yet enjoyed.

FOR THE NEW ENGLAND FARMER.

THE LONG RED POTATO.

MR FESSENDEN-There was an inquiry directed to you by M. of Wrentham, dated so far back as Jan. 2d 1827, to ascertain when, and from whence, the long red potato was introduced among us. It would have been some gratification to have had light thrown on the subject, in as much as this kind of potatos has been gradually improving in quality, and increasing in estimation, as it has got better naturalised to our soil and climate, and has got to be better known among the consumers. But I do not recollect to have seen any notice taken by any of your correspendents, of said inquiry. I will, therefore, the' at so late a period, offer the following as a fact well known to me. About twenty-three years ago, the late ISAAC DAVENPORT, Esq. of Milton, in the fall, went to Rhode Island in quest of young fruit trees. There were then but few nurseries near Boston, and he was directed to a quaker,

gone, he accepted an invitation to spend the night es, but only the main body of the potato, or such as PRESERVATION OF MELONS, &c. FROM there, and found his host to be an intelligent and have no branches. careful farmer. In the course of the conversamuch liked by the cattle; and he agreed to let carefully so as to exclude all the light grain, but was a complete prevention. him have a small quantity for seed. On his re- for potatos, any thing but the smallest, is by many turn home, Mr Davenrout, sent to that place, used for seed, and it cannot be a matter of surone of his neighbors, Mr EBENEZER FISHER, a na- prise that under such management, the sorts tive of Sharon, and a very clever man, who bro't should run out; and that it should become needto Milton a horse wa-g-n load of them, which fith once in a while, to change seed. The reason-was divided amongst a few neighbors. They ableness of using the handsomest and best potatos for gave a very great crop, but were unshapely, seed, is as evident, as to choose the best corn for branching out in numerous limbs, and watery, yet planting. the cattle and hogs appeared exceedingly fond of and it would be pleasant, and tending to useful- first had them. ness, to have any facts stated, which might illustrate the subject.

ment, was the result of individual enterprise and understood so well the management of fruit trees. exertions, and circulated slowly, circuitously, and, and few farms in the neighborhood of Boston are as it were, by chance. In these, our more favor- so abundantly and profitably stocked as his, with ed days, the numerous agricultural associations the best fruit, and with trees so healthy and well bring men and knowledge to one focus, hence the trained. they yield less at present than they did when first introduced. But the quality has greatly improved, and their shape has become more correct in citizen, a good friend, and an excellent farmer. our New England soil. It is a fact which must have met the observation of every farmer, that when the first frost comes in fall, it kills the green leafy vines of the long red putato, whilst the other sorts have generally decayed before that time; hence in yours of Sept. 12, has taken a too favorable we must conclude that the long red requires a view of milk paint. This is a revival of a subject longer period to grow, and come to that full ma- on which some French chemists indulged opinturity, which is surely indicated by the decay of ions, which to say the least, were hardly realised. the vines. If they are destroyed by the frost whilst green, it is evident that the ultimate growth let was published by a zealous friend to improve to escape with impunity if detected, than he who of the potato is stopped. It goes down to the ment, giving the materials viz. cellar to complete its maturity, which does not take place until spring, and then very imperfectly. It deprives therefore the long red of the high repute which it is due, and this injury might be prevented, to the great benefit of the farmer, by planting them earlier. They should be planted as soon be then no reason to complain that the ends eat watery, the whole potato would eat alike dry, mealy, and mature, and be the finest potato for the table. hence it goes further for food, and is more profitable whether for the table or for the use of the the parties. barn. If rightly boiled, there is none so mealy. Although the shape of the long red is more regu- he had, it would be a great benefit, extending a county, Pa. an ingenious mechanic, has taken out lar now, than it was formerly, it has yet a tendency to branch out, but I conceive that this defect I fear from some favorable appearances, too par-principle entirely new-by which it is said that will get entirely corrected in the course of a short tial views of its durability are entertained by your one ton weight of horse shoes may be made it. time, provided we take care never to plant the branch- ingenious correspondent.

CULTIVATION OF FRUIT TREES.

When it is considered that a bushel of penches can be raised at less expense than a bushel of potatos, and that pears are as easily cultivated as apples and are more certain to bear every year, it is not a little remarkable to see peaches selling at the rate of two dollars a bushel, and pears at from a dollar to a dollar and a half, as has been done in this place for the week past, and they have found a ready market at those rates. This being the case, it is worth the inquiry why good fruit is not more generally cultivated. We apprehend the principal reason is the prevailing habit in the country, of considering a man's right to his fruit as less sacred than it is to his other property .-Even among many who would revolt at the idea of taking and carrying away fruit without leave, a notion appears to prevail, that the man who has goe! roit is but little more than a steward over it, to see that it is properly distributed among his friends and neighbors, all of whom are considered as having a right to a share of it. We know a farmer who had a considerable number of valuable fruit trees, who cut them down, because the expense of giving away the fruit, and entertaining the company which it brought him, was greater than his circumstances would allow.

We have also known instances, where those who had good early fruit trees standing in exposed situations, have cut off the tops and grafted them with winter fruit, because their products were chiefly pilfered and carried away, so that the owner derived but little from them, except a plentiful harvest of vexation and trouble. Such a state of things ought to be corrected. The farmer ought to be considered as much entitled to the income derived from his fruit as his other crops and the pilferer from an orchard, ought no more pilfers from a cornfield or a granary. When this comes to be the case, and not till then, we may expect to see good fruit more general and abundant.

To bring about so desirable an object, those who could afford to give away fruit if they chose, should set the example of cultivating it for sale, both in the market and on their own premises .-Few would expect that to be given them which they might buy at a fair price, a public example should be made of them. Then others would be induced to engage in the culture, as a source of will follow their example. - Mass. Spy.

Mr. R. E. Hobart, of Pottstown, Montgomery one day, by his machine.

SILK.

II. Choosing the Cocoons for the production of Eggs. Continued from page 60.

About two onnces of eggs may be saved out of one pound and a half of male and female cocoons.

The small cocoons of a straw color, with hard ends, and fine webs, and which are a little depressed in the middle, as if tightened by a ring or circle, are to be preferred. There are no certain signs to distinguish the male and female cocoons: the best known are the following.

The small cocoons sharper at one, or both ends, and depressed in the middle, generally produce the male. The round full cocoons, without ring or depression in the middle, usually contain the female.

These may be distinguished from the dupoins by the extra size, the clumsy shape, rather round than oval, of the latter. As, however, all marks may fail, an extra number may be kept, of the best of those which are spun double, and when which is the part occupied by the head of the the moths come out, the males and females being moth. A few hours after, and sometimes in one easily distinguished, an addition can be made hour after, the moth will pierce the eccoon and from them to the defective side.

By shaking the cocoon close to the ear, we may generally ascertain whether the chrysalis be alive. If it be not dead, and loosened from the the cocoon.

III. Preservation of Cocoons intended for Seed, or until the appearance of the Moth.

Experience shows that where the temperature of the room is above 73°, the transition of the chrysalis to the moth state would be too rapid. and the coupling will not be productive; if below 66°, the development of the moth is tardy, which is also injurious. Damp air will change it into a weak and sickly moth; the apartment should therefore be kept in an even dry temperature, between 66° and 73°. When collected, spread the cocoons on a dry floor, or on tables, and strip them clean of down or floss, to prevent the feet of the moth being entangled in it when coming out. While cleaning them, all those that appear to have any defect should be laid aside; this is the time, also, to separate the male and female cocoons, as far as we can distinguish them.

Select an equal number of males and females, and keep the eccoons of the same day's mounting separate, that the moths may pierce them at the same time. If the good cocoons taken from the whole parcel, are all first mixed, and the selection of those intended for breeding be made from this general heap, many will be set aside which were formed by worms that had mounted upon different days, and which will be pierced by the moths unequally, and hence there will not be an equal number of males and females produced at the same time; this irregular appearance may cause the loss of a great many moths, or of several thousand eggs.

When the selection has been made, the sorted eocoons must be put on tables, in layers of about two inches, allowing the air to pass freely thro' them, that it may not be necessary to stir them frequently; but it is beneficial to stir them round once a day, if the air be moist. When the seed cocoons are not very numerous, they may be strung upon threads, and lung against a wall, or

dle as is sufficient to attach it to the thread. The middle is chosen, because it cannot be ascertained at which end the moth will pierce the cocoon .-when they come out.

If the heat of the apartment is above 73°, evplace, as a dry cellar.

Seventh Age of the Silk Worm.

The seventh, and the last age of the silk worm, comprises the entire life of the noth.

The formation of the moth, and its disposition to issue from the cocoon, may be ascertained when one of its extremities is perceived to be wet, come out; occasionally the cocoon is so hard, and so wound in silk, that the moth in vain surives to come forth, and dies in the cocoon. Sometimes the female deposits some eggs in the eocoon cocoon, it yields a sharp sound. When dead, it before she can get out, and often perishes in it; yields a muffled sound, and is more confined in this circumstance has induced some to extract the chrysalis from the cocoon by cutting it, that the moth may have only to pierce its thin envelope; but the experienced Dandolo disapproves of the practice (although he has performed the operation with success,) because it is tedious; and should the moth be put on a plain surface, five in a hundred will not be able to get out, but will drag the envelope along, and at last die, not being able to disencumber themselves. If the surface be not smooth, the moths will issue with greater ease; it is very favorable to the moths when they put forth their head and first legs, to find some substance to which they may fasten, and thus facilitate clearing out of the cocoon by the support .-For this reason, they should be spread out ven thin on tables covered with a muslin or linen cloth. The life of the moth lasts, in Italy, ten, cleven, or twelve days, according to the strength of its constitution, and the mildness of the atmosphere .-With Mr. Dusar, of Philadelphia, the moths lived from five to eight days; a but temperature accelcrates their operations and the drying which precedes their death .-- To be continued.

AGRICULTURE.

We understand that the price of wheat has lately experienced a considerable rise, and is now elling at Albany at 10s 6d the bushel. change in our markets may be ascribed to an anticination of short crops, in many parts of the country, in consequence of an unfavorable season. It appears by the late intelligence from Europe, that Great Britain and the continent, as well as our own country, have been visited by severe storms and floods, which will prove injurious to the harvests. From these causes, operating so extensively, it is not improbable that foreign ports will be necessarily opened, and the price of agricultural produce greatly enhanced during the present year .- New York Statesman.

The harvest has proved so short in Upper Cansuspended from a beam. Just so much of the ada, that the Lieut. Governor is about to prohibit could of the cocoon is to be pierced with a necdistillation from grain. GEOLOGY.

One of the most singular deposits of rock upon the earth is between Boston and Providence. It Place a male and female ecocon alternately upon is an aggregate of pebbles of all sizes, from a foot the thread, that they may be near each other or more in diameter to grains so fine that they cannot be distinguished by the naked eye. A cementing substance fills the spaces between the ery method of diminishing the heat should be pebbles, and unites them into a mass sometimes tried : such as keeping all the apertures to the almost as compact as a piece of granite, but fresumy side carefully closed, to cause thorough quently so loose that it is easily separated, and drafts of air to dry the humidity that exhales from even falls to pieces by exposure to the air and the chrysalides. Should the temperature rise to seasons. It is said that the ledges are of the 78° or 82°, the cocoons must be put in a cooler coarsest texture near the surface, or on the highest peaks, and as a descent is made they gradually grow finer, and finally become a sandstone or perhaps a fine slate. The composing pebbles have smooth and rounded surfaces, evidently produced by attrition or rubbing against each other at some former period, and in some different posi-

> Perhaps the most unaccountable fact respecting this singular deposit, is the seams or fissures which divide the ledges in various directions, passing so straight and exact in their course, that they separate the smallest grains and leave the surface as smooth as if it was polished. The pebbles are quartz, felspar, argillite and bornblende.

> The Catskill Mountains present a phenomenon bearing some resemblance to those already mentioned. The highest peaks of this range, which here and there tower above the rest, are composed of aggregates, resembling the coarsest masses deposited in the range from Boston to Providence, while the great mass of mountain on the declivity below resembles in its texture the finest portion of the other.

I mention the facts and leave them for others to explain.

This rock is called graywacke, and coarse graywacke is called pudding stone .- Boston Patriot.

We take this opportunity to remind our agricultural friends, that the 15th day of October next, is the day designated by the Executive Committee, of the Hartford County Agricultural Society, for the Cattle Show and Fair. The Committee having made the necessary arrangements, preparatory to this exhibition, all that is now wanting to give it an important character, is the exercise of a proper feeling among the friends of agriculture throughout the county.

We do hope that (this year) we shall not be bchind our friends in the neighboring Counties .-We can bave if we will, a rich and interesting exhibition. We have the means within our power.

In the exercise then of that noble spirit of emulation, so characteristic of the farmers in other sections of the State, do let us avail ourselves of them .- Hartford Mirror.

Cattle Show and Fair .- The season for our annual Cattle Show and Fair is fast approaching, and we doubt not the farmers have before this commenced their preparations for the occasion .-We learn with pleasure that several farms have been entered for the premium, and that the prospect generally of an interesting exhibition is very favorable. Hartford Courant.

Honey a cure for the Gravel .- A gentleman cured this disorder by sweetening his tea with half honey and half sugar. Others have followed the same prescription with success.

From the American Farmer.

SWEET BUTTER.

The component parts of milk are oil, curd and whev. The oily parts constitute the cream, and the curd makes the cheese. The oily parts, heing specifically lighter than the other parts of the substance, ascend to the surface in the form of cream.

In winter, four or five days, according to the common practice, are necessary to produce all the cream of a pan of milk. Such cream from this tedious process not unfrequently acquires a bitter taste, which is communicated to the butter. And the churning of butter from such cream is moreover an operation of four or five hours, and sometimes longer, unless hot water he poured into the cream, which invariably injures the butter, by

rendering it white and insipid.

To shorten the time, and to diminish the labor of making butter, and at the same time to improve its quality, there has been recently established in the dairy house of Mr. Ro. Smith's farm, called Orange, an apparatus upon the simplest principles imaginable. During the coldest weather in winter, in the course of less than twenty-fourbours after the milk has been taken from the cows, sweet cream is produced, greater in quantity and richer in quality than can be obtained in the ordinary management in five days. So rich, indeed, is the cream, that it is churned with as much facility as is the rich cream of the Alderney cows, in the summer season. The operation of churning never exceeds twenty-five minutes. The butter from such cream has never failed to be of a fine flavor and of a fine color; and in the nature of things it never can fail to be so, unless the dairy woman should be utterly ignorant of the art of making sweet butter. The precess is not a new invention. According to the principles of the system pursued at Orange, is made the sweet butter which, in England, is the most admired .-The part of the course of proceeding not in common use is this :- The pans, with the milk just taken from the cows, remain until a thin skin of cream is produced. They are then placed in hot water, and in about thirty minutes thereafter all the cream contained in the milk is formed on the surface. The cream thus obtained is managed as other rich cream is in all well conducted dairies.

The principal merit of the apparatus at Or-

The skimmed milk, consisting of card and With this apparatus, butter can be made in

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 19, 1828.

FARM BUILDINGS.

The first object when a new set of farm buildings is to be erected, is to fix on a proper situation, which ought to be as near as possible to the centre of the farm, more especially if it be arable. Nothing can be more proposterous, than to continue the old system of having the farm-houses placed in villages, totally detached from the farm; a plan which originated, from the want of domestic security in feudal times, or the dread of foreign invasion. If the farm buildings are placed at the corner of a large farm, a part of the land will probably be neglected-less manure will be sent to it-the expense of cultivation will be materially increased-the strength of the horses or oxen will be uselessly wasted in going backwards and forwards; and the remote parts of the farm, will be left in a state of miserable pasturage; or when occasionally broken up, the crops will necessarily be inferior to what they would have been, under a different system.

It is sometimes assigned as a reason, for not having the farm-houses and offices in a central situation, that at another part of the farm, a better command of water can be procured for family use, and for the farm stock, or for driving a threshing mill, by which a great saving in the labor of horses or cattle is secured. That, however, is only an exception to the general rule, for it may be laid down as an axiom, "that the farm-house and offices enght to be placed, as nearly as possible, in the centre of a farm."

Where the circumstances of the case admit of it, the farm house should front the south; for by this means it is less exposed to the cold northerly winds. The farm-stead should be placed on a well aired and dry spot of ground; and, if it can be had, an elevated situation is always preferable. This is not only the most conducive to health, but an advantage of considerable importance is obtained, namely, it puts it in the power of the farmer, to see what is going forward in every direction. Where the house, on the other hand, is built in a low and humid spot, the crops of the occupier, however dry and well conditioned when brought from the field, will soon acquire a softness, and perhaps mustiness, very injurious to the

In the construction of the dwelling-house, utility and not ernament ought principally to be kept in view. At the same time every builder of taste, in fixing on the site and plan of a new farm-house. and out buildings, ought certainly not entirely to overlook the embellishment of the country. It isdisputed, whether the house ought to have either wings, or a lean-to behind, or whether the whele should not be under one roof. Many think that a house of three stories, the kitchen half sunk, is

tached to the house.

A farm-house ought not only to be convenient, but should have such a degree of neatness and uniformity that an idea of comfort and happiness may be given. It should have a little plat of garden ground or shrubbery either before or behind it. In the latter case it is placed more distant from the effluvia of the dung-hill. In the former the out houses, laborers, and cattle are more immediately in sight. The windows should be large and the sashes placed rather nearer the outside of the wall than is usual; because, if wet, they will in that case, somer become dry. The house should be at a moderate distance from the other farm buildings, not only for the sake of purer air, ed, that to permit young fruit-trees to bear fruit, but that the risk of setting the buildings on fire, for some years, is eventually to do essential injury by sparks from the chimnies of the house may be avoided. This is another argument in favor of placing the garden between the house and the farm buildings.

Many an industrious farmer has obtained the plying an adequate preportion of it to the purchase principally by the plough instead of the spade .stances require is wasteful prodigality. Above cd, and a considerable expense saved. all, increasing the expense by making ornamental erections cannot be too cautiously avoided.

PROFITS OF GARDENING.

It is stated in Berk's Report, that near Devizes, and other towns in Wiltsbire, (Eng.) many families subsist by occupying from two to five acr s as garden ground. The soil is sandy, and applied to the produce of esculent vegetables for the consumption of the neighboring towns and villages. So productive are gardens, when well managed, that three brothers, who followed the art of gardening, supported as many families, very decently, and gradually acquired some wealth, by the cultivation of about five acres of la d.

SOAPER'S WASTE.

Sir John Sinclair asserts that soaper's waste used in moderation by itself, or in a compost with earth, is an excellent manure for garden soils .-This substance not only destroys insects and their larvæ, but consisting principally of calcareous matter, every species of vegetables is greatly improved in quality, where it is applied.

FARMER'S GARDENS.

A garden, under a proper system, is a most valuable acquisition to a farmer, with a view both to comfort and economy. Many enlinary articles may be obtained from a well cultivated and sheltered garden, which cannot be raised in the field, or will not grow in exposed situations, with equal luxuriance and perfection. Attention, likewise, Should be paid to the sowing of different articles at various seasons, by which an earlier and a more equal, as well as more regular supply for farmer would be thought crazy, who should exthe table, may be obtained. It is also of use to pose his cattle-fodder to the weather for months, employ a piece of ground in a garden, for raising before he made use of it; and he cannot be in cabbages, Swedish turnips, and other plants to be in suffer wards turnips, and other plants to be in suffer wards transplanted into the fields. The ref. the hearts-blood of agriculture) to be sucked up use of the garden may be given with advantage by the sun-drizzled away by the rain, or tossed to pigs, and man h cows. At the same time, work- about by the four winds of heaven.

the driest, the cheapest, and the most convenient. ing in the garden should always be considered as Others prefer having the kitchen in a wing, at- of inferior consideration to the business of the farm; and on no account ought the farmer's attention to be materially drawn off from his crops of grain and grass.

SEA WEED A MANURE FOR ONIONS.

Sir John Sinclair says "Sea weed, where it can be procured, is an excellent manure for garden crops, in particular for onions." And in the General Report of Agriculture in Scotland, vol. ii. page 94, it is observed that "When sea-weed could be had at Kirkaldy, at a reasonable rate, the crops of onions were remarkable for their produce."

YOUNG FRUIT TREES.

Sinclair says, it cannot be too strongly inculcatto their future fruitfulness and duration.

CULTIVATING A GARDEN WITH A PLOUGH.

character of being a bad husbandman, from hav- tioned by Sir John Sinclair, who says in sub- Four other pairs are placed in the 6th, 7th, 8th, ing been unguardedly led to exhaust his capital stance that there are not less than 8000 acres in and 9th segments and the 8th pair in the last diso much on buildings, as to disable him from ap- all, cultivated in the neighborhood of London, vision of the body," &c. of proper stock or to the cultivation of the soil. A garden cultivated in that manner may contain is extracted suggests no remedy for the ravages And it may be laid down as a maxim, that though an aere with advantage. By subst uting the a farmer is well entitled to accommodations, in plough for the spade, the work will require less proportion to the size and produce of his farm, attention; the necessity of having a professed vet to erect these on a larger scale than circum- gardener accustomed to digging will be prevent-

BANKING UP HOUSES.

The best mode of banking up houses, so as to keep frost from cellars, and render the lower rooms warmer than they would be otherwise, is to set single boards on edge, parallel with, and about a foot and a half or two feet from the sills or sleepers of the house-and fasten them in that position by pins or stakes, driven into the ground. Fill in a layer of dirt between the boards and sills, and over that place a layer of straw oc other litter. Then place boards flat-wise, or nearly horizontally, descending a little from the house so as to shed rain, and carry it over the boards placed edgewise as stated above. The straw or litter will effectually prevent the frost from penetrating your cellar to spoil your vegetables. Next to a smoky house, and a scolding wife, a freezing cellar is earnestly to be deprecated, and if possible, avoided.

SUMMER-MADE MANURE.

Many cultivators waste nearly all the manurc, which their cattle make in the summer time by mismanagement. Their cow-yard is large, and the droppings of their cattle are spread in thin layers over a large surface. Of course they are first dried through and through by the sun, and secondly, washed away by the rains. Cattle should be varded in summer in a small space. Their manure, once or twice a week, at least, should either be ploughed in or mixed with soil, for compost-placed under cover-shovelled into beaps and covered with earth, or in some way secured against the robbery of the elements. A

LOCUST TREE INSECTS.

A gentleman has sent us (preserved in spirits) an insect, found in the locust tree. It is the well known destroyer, for whose extirpation the Mass. Agri. Society have offered a premium of fifty dollars. It is described at length in the Mass. Agri. Repos. vol. v. page 67, and drawings of the insect, showing its appearance in the several stages of its existence are there given. By the writer of the article referred to the insect is denominated Cossus robinia; and the following is a part of his description: "The general color of the larva is red, approaching that of the cherry, paler towards the sides, deeper towards the middle of the back, and in each segment there are several tubercles of a reddish chesnut color, from each of which arises a small bristle. The under side of the body is paler, and of a dull white, very slightly tinged with red. The head is chesnut colored, the teeth very dark, and almost black. It has sixteen feet, or eight pairs. Three pairs of these are placed in the three first segments of the body; these are Field gardens cultivated by the plough are men- terminated by a single claw, as in all caterpillars.

> The writer of the article from which the above of the insect. But the New England Farmer, vol. iii. page 382, has the tolkwing remarks on the locust tree borer: "A horticulturist tells us that he has preserved his locust trees against the borer, which has almost annihilated that fine tree in this part of the country, by first probing the holes made in the tree by the insects with a small flexible wire, a little hooked or curved at the end, introduced into the tree. With this he destroys or extracts as many worms as possible. He then with a small syringe, injects into their holes strong soap-suds, which puts a finishing hand to their execution.

> The following extract from a report by a Committee of the Essex Agricultural Society, will show that this insect, though injurious is not always fatal to this valuable tree:

"An objection to the cultivation of the locust tree is often brought from the fact that they are sometines destroyed by worms. This is truebut the ravages of this insect are found to be greatest where the trees are few and scattered .-In the grove on this farm, [that of Dr. Nichols of Danvers | which extends over a number of acres, and in the other groves in this vicinity, but very few of the trees are at all injured by worms. This objection is by no means sufficient to authorize the neglect of their cultivation." See N. E. Farmer, vol. iii. page 147.

* Economy in Money Matters .- The subscribers to the New England Farmer, who would willingly oblige us by prempt payment, and save fifty cents into the bargain, are respectfully reminded that by paying in advance, they will obtain the current volume of the New England Farmer at \$2.50, instead of \$3.00, which, according to the terms of the paper, will be otherwise the invariable price. The advance payments are now due .- A word to the wise, is worth a whole vocabulary to the otherwise.

TWe wish the friends to this journal to bear in mind that by obtaining five subscribors, and forwarding the payment for the same, they will have a copy sent to them, gratis, as long as the payment is annually forwarded. They may thus secure to themselves a copy of the work, and materially forward the interests of the publication.- New subscribers can be supplied with the preceding numbers of the current volume.

AGRICULTURAL SEMINARY.

An individual has offered to appropriate ten thousand dollars to the establishment of a practical Seminary for the cultivation of the various branches of agricultural and mechanical science; to be located in the central part of Massachusetts, and placed under the supervision of the American Lyceum. It is expected that this institution, which is to embrace extensive workshops, gardens, &c. on the most approved models, will go into operation early in the ensuing spring. - Bulletin.

PREVENTIVE AGAINST CANKER-WORMS.

Some notices of an invention for preserving fruit trees from canker worms were meant for this week's N. E. Farmer; but, in consequence of the mislaying of papers, they are unavoidably deferred. We hope to publish something on the subject in our next .- An answer to the query of our "Westminster subscriber," as soon as possible, probably next week.

TO PURIFY RANCID BUTTER.

Melt it with a slow fire, in a well glazed carthen vessel, to which put soft water, working them well together, and when it is cold, take away the curd and the whey at the bottom; do it a second and a third time in rose water, always working them well together. The butter thus clarified will be of the sweetest delicious taste.

The preceding recipe (taken, we believe, originally from an English paper,) is of some consequence if correct. Try and let us know how it succeeds.

Old Dr Hunt used to say when he could not discover the cause of a man's sickness; We'll try this - and we'll try that. We'll shoot into the who may visit us at the approaching Cattle Show. tree, and if any thing falls, well and good." Aye, (replied a wag) I fear that is too commonly the case, and in your shooting into the tree, the first thing that generally falls is the patient."

London-porter.—The scale on which brewing is conducted in England, may be conceived from the annual statement of the porter, ale, &c. given in London. The highest on the list is Barclay, Perkins & Co. whose returns of porter for the year ending the 5th July, amounted to 305,937 barrels, or about a 1000 barrels a day, exclusive of holidays. Last year their report was 341,330. The total amount of 10 houses was 1,341,660 barrels, somewhat less than the preceding year.

Moscheloes .- If money has been scarce the present season, moschetoes have been plenty. We speak feelingly on this subject, having been kept awake, in torture most acute, by these musical in-truders on nocturnal repose. They are terribly annoying, particularly to those not fond of music. A night or two since, we woke up in agony, writhing under the sting of these horrible musicians, that make such "concordant discord," and imagined a full band of musicians in our room, chauting some infernal dirge. If they would sting and be off, we would willingly spare a few of them a drop or two of blood, but then their melody, we had rather hear "a brazen candlestick squeak," or hold sweet "converse with the wheel of a knife grinder." But we have found a remedy,-the moscheto net, commonly called a pavilion, effectually protects against the sting of these tormentors .- Manuf. and Farmers' Journal.

WORCESTER CATTLE SHOW.

We have every reason to expect a more magnificent display at the approaching Cattle Show, than has graced the former festivals of our county. Strangers will be doubtless attracted, as well to witness the Exhibition of Agricultural riches, as from curiosity, to be spectators of the commencement of internal navigation. Our County is so filled with beautiful animals, the fields are so profusely spread with the wealth of cultivation, the looms of its manufacturers are so busy in the production of cunning works, that we confidently anticipate an exhibition of the tenants of the stall, the products of the earth, the fabrics of industry, and the combinations of ingenuity, which may sustain the character so justly acquired by the County of Worcester, for the fertility of its soil, and the public spirit of its inhabitants. - Worcester Egis.

BLACKSTONE CANAL.

We learn that the Canal is now rendered navigable to Uxbridge in this County, and that it is expected, unless delayed by unfavorable weather, that the whole work will be so far completed by the first week of October next, that boats may

Arrangements have been made to raise the supplies of money necessary for its completion beyond the amount of original subscriptions, by leans obtained on the joint credit of the corporation and some of its most responsible Stockholders, so that no pecunitry delay will impede the completion of

A passage boat is to be constucted in this town, which, with those already navigating the waters of Rhode Island, will probably furnish ample accommodation for the journey of those strangers Worcester . Egis.

New mode of making Jelly .- Press the juice from the fruit; add the proper portion of sugar, and stir the juice and sugar until the sugar is completely melted; and in twenty-four hours it will become of a proper consistence. By this means the trouble of boiling is avoided, and the jelly retains more completely the flavor of the fruit. Care should be taken to stir the mixture until the sugar is completely melted, and fine sugar should be used.

Treasure trove.—A solid mass of gold was lately found in Anson county, (South Carolina) which weighed about thirteen pounds, Troy weight. It was sold for \$2.500.

Tulips.

Just received at the New England Farmer Seed Store, No. 52 North Market Street.

A fine collection of Dutch Tulips of bright red, yellow, white, and splendid variegated colours;—12 1-2 ets. each, \$1,00 per dozen, assorted.

Hemp Secd.

Just received at the New England Farmer Seed Store, No. 52 North Market Street.

A consignment from Tray, N-Y. of 50 bushels of Heinp Seed,

them to this office.

Seeds for Fall Soicing.

For sale at the New England Farmer Seed Store, a fresh sup ply of various Grass Seeds—also a great variety of vegetable seeds for fall sowing, viz. White Portugal Onion, Strasburg do. Silver skin do. Priekly Spinaeh and Dutch Cole for early greens -various kinds of lettuce, carrot, encumber, cabbages, Ac. POTATOS, new black Spaqish or winter radish, &c. all warranted fresh. CIDER, [according to quality.]

SUBSCRIPTION.

For importing Grope Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr Alphonse Loubat, having considerably enlarged his Vincyard, on Long Island, where he now has, in full cultivation, that five acres of ground, entaining 72,000 Grape Vine Roots; having also the peculiar adventage of being enabled to procure the best specimens of recoverent his father's extensive vineyards and nurseries, in the districts of Hordelais, Clerac, ouryains and nurseries, in the distorts of Bordelais, Clerac, and Buzet, departments of Groude and Lot and Garonne, in France, (15° N. Lat.) proposes to the nuncrous friends to the cultivation of the grape vine in the United States, a subscription with the opened on the first of August, 1925.

Mr A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them s me (toots, people the first of March next, and forward them fice of expense, to the different cities, where subscription lists shall have been opened. The roots will be three years old, and will produce considerable from the second year som the time, of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to the subscribers design nating the quantities and species of the graph vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 30.—
Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 1 ; and 18 cents for less than 50 roots.-Payment to be made on deliv-

ery of the roots.-Letters not received unless post paid. ery of the roots.—Letters not received unless pess paid.
Subscription lists are open at New York, with Viphouse Loulant, 35 Wall street—Boston, E. Copelant, Jr.—Albany, R. Wilschael—Philadelphia, Van Amringe—Baltimere, Willard Rhoads.—Washington City, Wor, Pairo,—Richonend, Davenport, Allen & Co.—Sexumah, Hall, Shapter & Tupper—New Orleans, Foster & Hunton—Charleston, (S. C.) J. & J. Street & Co. M. A. Loulant's Lock on the Culture of the Grape Vinesand on the Making of Wine, may be found at the principal book. schers of the United States; and his agents will turnish them gratis to subscribers.

MISCELLANIES.

(From Bailey's Lays of a Minstrel.)

THE BRIDEMAID.

The bridal is over, the guests are all gone, The bride's only sister sits weeping alone; The wreath of white roses is torn from her brow, And the heart of the bridemaid is desolate now.

With smiles and earesses she deck'd the fair bride, And then led her forth with affectionate pride; She knew that together no more they should dwell, Yet she smiled when she kissed her and whisper'd farewell.

She would not embitter a festival day, Nor send her sweet sister in sadness away; She hears the bells ringing, she sees her depart, She cannot veil longer the grief of her heart.

She thinks of each pleasure, each pain that endears, The gentle companion of happier years; The wreath of white roses is torn from her brow, And the heart of the bridemaid is desolate now.

Sentiments of the famous Mr. Penn with regard to Marriage .- Never marry but for love, but see that thou lovest what is lovely. If love be not thy chiefest motive, thou wilt soon grow weary of a married state, and stray from thy promise, to search out thy pleasures in forbidden places.

Let not enjoyment lessen, but augment affection; it being the basest of passions to like, when we have not, what we slight when we possess.

It is the difference betwixt love and lust, that this is fixed, that volatile; love grows, lust wastes by enjoyment. And the reason is, that one springs from an union of souls, and the other from an union of sense.

They have divers originals, and so have differcut families; that inward and deep, this superficial; that transient, this permanent."

They that marry for money cannot have the true satisfaction of marriage, the requisite means being wanting.

Meu are generally more careful of the breed of their horses and their dogs, than of their children. Weights and Measures.

Those must be of the best sort, for shape, strength, courage, and good conditions; but as for these, their own posterity, money shall answer all things. With such, it makes the crooked strait, sets squint eyes right, cures madness, covers folly, changes ill conditions, mends the skin, gives a sweet breath, repairs honors, makes young, works

O how sordid is man grown! Man, the noblest creature in the world! As a God on earth, and the image of Him that made it: thus to mistake earth for heaven, and worship gold for God.

Montgomery has beautifully described Columbus, while meditating on his great expedition, as gazing with eager anticipation, towards the new world which he hoped to discover-

> "Lights of Heaven! he cried, Lead on! 1 go to win a glorious bride. By nature nursed beyond the jealous sea, Denied to ages, but hetrothed to me.'

This bride our pilgrim fathers found on these unvisited shores. On her shady bowers no rude spoiler had intruded. None of the corruptions of the old world had found their way into her bosom. She was worthy to be the bride of our of freemen .- Knowles' Address.

GRAVE CORRESPONDENCE.

Dr. Schmidt, of the cathedral of Berlin, wrote to Frederick II. in the following terms:

Family. I acquaint your Majesty, second, that been paid for it the past snmmer .- Microcosm. there wants wood to warm the Royal seats. I acquaint your Majesty, third, that the balustrade, next the river, behind the church, is become ruin-SCHMIDT, Sacrist of the Cathedral."

The King, much amused with the epistle, sent the following answer:

"I acquaint you, Mr. Sacrist Schmidt, first, ond, I acquaint Mr. Sacrist Schmidt, that those the stove with a piece of linen rag; then with a acquaint Mr. Sacrist Schmidt, fourth, that I will not have any more correspondence with him.

FREDERICK."

Anecdote .- A venerable Friend and a dashing buck, driving their respective vehicles, met in a narrow road, where neither could pass without the consent of the other. After some dispute, as to which should first turn out, the buck drew a newspaper from his pocket, and set about perusing it very diligently; upon which the Friend, with characteristic composure, asked, "Friend, has thee another paper in thy pocket?" "No!"__ "Then when thee has done reading the one in thy hand, I would thank thee to loan it me !"

Empiricism reproved .- When the revolutionary government of France, at the suggestion of the National Institute, attempted to introduce a new meteorology, by dividing the quadrant of the meridiau into one hundred, instead of ninety degrees. a French navigator, finding himself much perplexed in the practical application of this new theory, sarcastically recommended to the Assenibly a decree t at the earth should perform four hundred revolutions in a year !- . AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

FRUIT TREES.

MR FESSENDEN-It is possible that the following crude hints may be useful to some of my less experienced brother-farmers.

Within a few years I have transplanted on my farm several handred apple trees, some of which have been set in Spring, and some in Autumn .-But not remembering to have lost a single tree, .l am unable to say which time is the best.

The method I have generally pursued is this: And the earth taken from below what is useful as soil, we cart into the road, or wherever it may be out of the reach of frost. In February or March of compost, or good seil from the road. In re- good but a very short time after being opened .gard to trees in general, I have ever found advan- T. A. Meyer Chapton Nursery, Jun. 3. tage from intermixing from the earth, while setting, a hushel of rotten manure to each tree.

as much as the roots have lost in taking up. We every month, that those beginning to speck may set the trees about as deep as they stood in the he used or taken out .- Id. nursery; treading the ground as hard as we can 5. Management of the Fig. - In the autumn, bebeing visited by any horned cattle.

thousands equally good are now for sale, by, Sir, erops the ensuing summer. - Id. Yours respectfully,

Newton, Sept. 23, 1828. J. KENRICK.

ABRIDGED COMMUNICATIONS.

(From Loudon's Magazine.) 1. Cape Broccoli .- This is grown in great perfection in the following manner: In an open, warm situation, during the first week in June, mark out holes in rows 3 feet apart, and nearly 2 feet over; dig out the holes to the depth of I ft. fill half up with rotten dung, and cover this with 2 inches of the mould, which will leave a cavity of four or five inches below the surface; on this sow seeds thinly, rake in, and dust the surface with soot; when the plants have risen three or four inches, select three of the strongest to stand for use, earthing up as they advance, and watering if the season be dry .- William Boyce, Kings-

cote Gardens, Sept. 1, 1827. 2. Read Mats .- These are not used in gardens so much as they deserve to be. Many beds of useful and ornamental plants require temporary may be protected by the simple contrivance of

of a house, and fixing them to a frame of stakes and poles, on which they may be rolled up or let cherries, peaches, and some other fruits which are down at pleasure; or if each mut were stretched of perishable nature as soon after the fruit is and fastened to thin ledges of wood and painted, ripe as possible. If the seeds are kept till the they would be more durable, and withal so portable, that they might be used for any purpose, and vegetative principle is destroyed. It is a good at any time .- S. April 10, 1828.

3. To keep the common Blue Plum, - Glass vessels, or small wooden casks made air and water tight, are used for this purpose. When ripe, the fruit is gathered with great care (the hands being covered with soft gloves, and only the stalks touched, in order to preserve the bloom), and laid wherever the soil is thinner, or the land dryer than one by one in the vessel till it is full. The vessels I could wish, I direct the holes to be dug about 4 are then closely covered by wet bladders so as to feet in diameter, and from 20 to 24 inches deep, completely exclude the air, and buried in the ground, or suspended in cisterns, wells, or cellars, wanted, and return to the holes an equal quantity, they may be used, and, if the above precautions of those small stones which are usually consider- have been taken, will be found excellent. The ed a nuisance; with these we intermix any kind vessels should be small-sized; as the fruit remains

4. To keep Pear . It the north of Granany they been winter bears jurked in wer is boxes In digging up the trees we are careful to rob or cashs, interlaceted with clean sweet straw. them as little as possible of their roots; and aim closete star down, and blaced in a root, but of to diminish the lateral branches by pruning about the reach of frost. The fruit require examination

around them; setting out, and keeping them fore the leaves drop from the tree, pull off all the erect; and let them stand without stakes; or green fruit, because few of them will survive the winter. This, however, should be done before It is surprising to see how rapidly these trees the leaves fall, otherwise the wounds do not heal. have grown. There are several now in fair view, It is attended with this advantage, that where one which were set out in the beginning of May last, fruit is pulled off, two generally burst from the on which may be seen a full grown handsome ap- place in the following spring. The conclusion will undoubtedly be drawn pots) are placed in an airy, yet sheltered situation. that these trees must have been thrifty, and of and carefully defended from frost during winter. bandsome size when removed. They were; and they, under ordinary management, yield plentiful

> 6. Protecting Vines from Spring Frost .- In the west of Germany, where the vine is extensively cultivated, especially near the Rhine and Moselle. the young shoots of the vine are often killed by night-frost, which at once destroys the crop of the present year, and injures the trees for several years to come. To avoid this misfortune, the husbandmen, on evenings when they expect a frost. light a fire on the west side of the vineyard, and keep it up all night. For this purpose, they collect green boughs of trees, wet straw, rubbish, hav, weeds, or any other litter which will burn slowly, and emit much smoke. This remedy is effectual, and, if neglected, the vineyard suffers : the early check prevents the ripening of the wood, and, without this takes place, no great erop can be expected in the following year .- Id.

SOWING FRUIT WITH THE SEEDS, &c.

Darwin says when the fruit which surrounds any kind of seeds can be sowed along with them, to the particular fashion of his neighborhood .it may answer some useful purpose. Thus the leaning two mats against each other, like the roof nourish their germinating seeds in the spring.

It has been recommended to sow the seeds of next spring they become dried through, and the plan to keep small and rare seeds in their pods till the season for sowing them.

FOR THE NEW BRGLAND FARMER.

Mr. Fessenden-In your paper of the 15th inst. you mention as an important circumstance, that the Bread-fruit Tree is about to be introduced into the gardens of the London Horticultural Society at Chiswick. To show that our American establishments are not behind those of Europe, I have to state that three species of the Bread-fruit have been cultivated at Mr. Prince's Linnæan Botanic Garden at New-York for a number of years, viz. the Artocarpus incisa, or Otaheite bread-fruit, Artocarpus sinensis, or Chinese, and Artocarpus nucifera, or Nut-bearing, of each of which species he has from six to twelve plants in a most flourishing state. The price of the first named species at London in the spring of 1827, was seven to ten guineas each plant; in Mr. Prince's catalogue they are priced at \$10 each.

DOUBLE CARTS.

MR FESSENDEN-In Loudon's Encyclopedia of Agriculture, page 402, is a description of a wagon, which is so contrived that it may be changed into two cars by separating the forward from the hind wheels without any other alteration. I wish to inquire of you, or through the medium of your useful paper, whether there are any such wagons used in or near Boston? If so, do they answer a good purpose? What are the best dimensions for one? And what would probably be the cost of one? By communicating any information relative to the subject, you will confer a favor on

A SUBSCRIBER.

Westminster, Vt. Sept. 18, 1828.

Remarks by the Editor .- The wagon alluded to by our correspondent, is thus described by Mr Loudon:

"Rood's Patent Wagon is a contrivance whereby the same earriage may, in a few minutes, be changed into two complete tip-carts of the common dimensions, and applicable to all the uses of carts in general, or iuto one wagon, so complete, that a narrow inspection is necessary to distinguish it from a common wagon. The carts have a contrivance to render them more safe and easy to the horse in going down a hill, and have movable side ladders, which will be found of great use in carrying oorn, bark, &c. It may be constructed with perfect facility by the wheel-wrights of any county; its shape and particular dimensions can be suited to the wishes of the owner, or

EDWARDS' PATENT ROTARY ... CHINE. Mr. Fox's merchant flour mill, situated on a is three stories high, large, strong, and handsome-The ice which was brought here from the north by built, and the machinery in complete operation last winter, is found to be much clearer, harder for merchant work. It has an overshot water The great difficulty in obtaining a full supply of and more durable than that which is usually col- wheel thirty feet in diameter, and two run of burrs water wheel is produced by two rotary pumps or suction machines, on a new principle, invented by John Edwards, of this city, who has a patent for the same. The water is raised by a small steam engine, which throws a sufficiency to run the two run of burrs, with all the gearing and machinery, MR. SKINNER-An inquirer in your paper of of the mill. It is allowed by good judges, that August 15th, No. 22, is desirous to find out a this mill makes as good flour as is made in the western country. It is considered a great acquisition to this city, and this new patent bids fair to evaporation, which is but small, and can be kept or cisterns. It is allowed by judges, that the engine now in use throws water enough, besides the two pair of burrs now in use, to run another pair : and that there is power sufficient still left to run another pump of the same size. As many pumps as she can run will be so many pair of burrs. It is now open to view, and the community can visit the mill and judge for themselves .- Cincinnati-Republican.

> A baked soup .- Put a pound of any kind of meat, cut in slices-two onions, two carrots, each cut in slices-two ounces of rice, a pint of split peas, or whole ones previously soaked-pepper, and salt, into an earthern jug or pan, and pour one gallon of water. Cover it very close, and bake it with the bread.

Two medicine pedlars went to Nantucket with a lot of boluses. They could sell nothing-the people were so healthy.

THE FLOOD.

some of the farmers have been engaged in stripping down the husks of the Indian corn, leaving the ears to dry and ripen on the stalks; others in gathering their corn and husking it. Some of it is but little injured, and some is materially damaged. them will be I ft in the ground. We believe that a great portion of the potatos in the low meadows in Hadley, Hatfield and Deerfield, have shared the same fate with those in Northampton.

Considerable loss has been sustained in nearly all the towns in this county. The roads are much injured, many bridges gone, and much damage done to other property. Josiah Mills, Esq. of Worthington, lost fifty merino sheep. We are informed that one fourth of an acre of land in Amherst was carried away to the depth of twenty feet, and deposited on a lower field. In Northampton a blacksmith's shop, and some other property belonging to Mr. Salmon Ensign, were swept away.

Errors corrected .- The bridge on Fort river in Hadle: is not gone. The water cut a broad channel round the bridge, but did not carry it off. We were misinformed in regard to the destruction of salt at South Hadley Canal.

In the vicinity of Hartf rd the low lands were covered with wear and the crops destroyed or i : it some families were much init in which the streets near the driven fr Fifeld Falls is estimated river. T. at from 5000 - 1 1000 dollars; the Hartford Mirror says the 1 so will not exceed 5000 dollars.

At Farmi arton the embankment of the canal adjoining the river gave way for a number of rods, and the earth was removed ten or twelve feet below the original bottom of the canal. The great culvert was seriously undermined and damaged, and the month of the Farmington feeder greatly injured.

The papers from the north and south are filled with accounts of the disasters occasioned by the late rains .- Hampshire Gazette.

INSTINCT OF A SHEEP.

A gentleman of Inverness, on a recent journey in the Highlands, while passing through a lonely and unfrequented district, observed a sheep hurrying towards the road before him, as if to intercept his progress, and at the same time bleating most piteously. On approaching nearer, the animal redoubled its cries, and looking significantly in the face of the traveller, seemed to implore some favor or assistance at his hands. Touched with a sight so unusual, the gentleman alighted, and leaving his gig, followed the sheep, to a field in a direction whence it came. There, in a solitary carn, at a considerable distance from the road, the sheep halted, and our traveller found a lamb completely wedged in between two large stones of the eairn, and struggling feebly with its legs uppermost. The gentleman instantly extricated the little sufferer, and placed it safely on the neighboring greensward, while its overjoyed mother poured forth her thanks in a long continued and grateful, if not a musical strain .- Inverness Courier.

Johnny, or hoe-cake .- Scald one quart of milk, and put it to three pints of Indian meal, and shalf a pint of fine flour-salt and sweeten it and bake it before the fire.

The following is the manner in which the cloth must be arranged:

At the bottom of a tressel or frame, which two boards, so arranged that one of their sides When any thing is to be done in the dark may be nailed to the tressel, about five inches and that it may hang equally on each side. The ends of the cloth must cover the boards below; the

thrown away; if of females, males must be allot- males must be placed upon it, in order that the eggs may be equally distributed. When the heat the eggs will be yellow, that is, unimpregnated; or of a reddish color, that is, imperfectly impregnated, and will not produce worms: the temperature of the room must therefore he kept between escape from its mate before impregnation, and produce many useless eggs .- To be continued.

HEMP.

The following letter to a gentleman in this or lint, is well entitled to the particular attention of hemp growers in this section, where but little practical knowledge exists as to the culture of this important article. The value of Mr. Hines' remarks will be obvious to every experienced farmer, and when he perceives the ease with which hemp is cultivated, and looks to the extensive home market secured to it by the tariff, he can no longer hesitate as to the policy of turning his attention to the production of an article for which there must always be a high demand.

Burlington, Vt. Free Press.

"There is no invariable rule as to the time of cutting hemp planted for seed, by the general complexion of either the male or female; but particular care must be had to the color of the seed, when the hull that encloses it is taken off.-The seed should be generally changed to a grey or brownish cast. If two thirds of the seed wear that appearance, the sooner you cut the better .-It should be bound in small bundles immediately after cutting, and set up in small stacks-from four to six bundles in a stack-binding in all the branches, by putting three bands round the samenear the top of the shocks or stacks. It may stand in this situation until dry enough to thresh, -say from five to ten days, as the weather may be for drying.

"The seed may be threshed in the field on sheets made of strong cloth, or on a floor. Great care should be used in moving the hemp to the place of threshing. If threshed in the field, it should be moved on a cloth attached to two poles, like hay poles, to save the loose seed. If removed to a barn, it should be done on a cart or wagon, with a cloth or tight box.

"We clean with a common fanning mill, taking care to give the proper speed, and to guage every part to suit the weight of the seed.

" After the seed is cleaned and put into bins or casks, it will be well to shovel it over, to prevent it from heating. I am quite sure that seed kept from heating, and from wet, will be good as long as three years, if kept cool in the summer.

"If your homn is sown broadcast, and you design to save the seed, cut it when about half the seeds have begun to change their color, and proceed as above directed-only you will thresh in four fair days, without breaking the bundles, and put the hemp under cover to completely cure,and when thoroughly cured, you may thresh again, breaking the bands as other grain.

"Mr. Lewis Buffet, of Seaghticoke, the last year, sowed five bushels of seed on two and a half acres of land. He cut his hemp with a cradle, and practised as here directed. He saved sixty-six hushels of seed, of a good quality; and his * Essai Sur l'Histoire des Muriers et des Vers a Soie. p. 62. share of the hemp sold for seventy-two dollars,

hemp.

planted hemp; but use it carefully, so as not to iar off the seed.

ed by the weather.

" N. B .- Use the common flail for threshing. "I am, in great haste, your obedient servant, "JOSEPH HINES.

On the Holly and the Hazel, as Underwood. By Mr. JAMES FRAZER.

to some of your numerous readers.

ought to be conversant in these matters. I am at for game covers and beauty. sorry to say, however, that in the greater part of the plantations I have visited throughout this Notice of a Mode of procuring Sticks for training country (Ireland), these useful and ornamental shrubs, in common with the other trees, are their management.

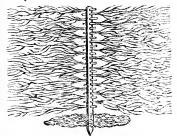

The holly, as a shrub, is unequalled, whether ed preference, for whip-handles, to the holly than any other. grown on upland; not only on account of its being tougher, but, by reason of its slower growth, the branches are more closely set, which saves them considerable trouble in forming artificial knots. The turners adapt the holly grown in various situations to different purposes, according to the density of the timber. The hazel luxuriates most in deep upland; and although it is to be met with in the rocky glen, on the mountain side, and in the bosom of the forest, yet, in a profitable point of view, a strong and dry loam will be found the most advantageous. There are few plants more accommodating, none more simply beautiful; and it is an indispensable appendage in representing the truly picturesque scenery of our country. The coopers also prefer, for hoops#, hazels of upland growth, as the whip-makers do the helly for handles, but for different reasons, as quickness of growth and thinness of branches are, with the cooper, principal accommodations.

With regard to the hazel copses in this country, I have met with very few under what I conceive proper management. In many of them prema-

ue of the lint, one hundred and eight dollars -- they are suffered to grow till beauty and utility propose driving it 18 inches into the ground, that Such hemp, when broken in an unrotted state, are sacrificed, and the standard trees of the wood it may be so firmly fixed as not to be moved by and subjected to a water process after breaking, much injured. When cut over, every shoot the wind. If any trouble arises in making the and properly cleaned, will equal the best Russian which springs up is suffered to remain on the sticks fast in the stake, it is very easily remedied "We use the common corn cutter for cutting deed, when near a market town, a few young sticks I used are elm, but bazel or any other shoots are cut and sold for basket rods, &c .-When beauty and cover for game form the sole do equally well. "In all cases where you wish to save the lint, object, with regard both to holly and hazel, the you will be careful to put the stem under cover principal matter to attend to is to keep the bushes as soon as you can, to prevent it from being stain- of a moderate height, and to lop off any straggling branches which have a tendency to produce nakedness at hottom. When profit only is considered, a different course is to be pursued. In young couses, the chief thing is to invigorate the roots, and to suffer no more shoots than are absolutely necessary, to remain in the stools till they have acquired sufficient strength. After cutting over, should the stools push strongly, the superfluous shoots ought to be occasionally displaced, leaving only what the stools can fully support; That holly and hazel, independently of their and those intended to remain for hoops and poles uses, are the principal constituents in the filling may be much forwarded by rubbing off all unneup of sylvan scenery, few, I presume, will deny: cessary buds as they appear. This work I have some hints, therefore, relative to the treatment of readily performed with children. When profit these shrubs, both in an ornamental and useful and ornament are jointly considered, which is point of view, may perhaps not be unacceptable uniformly the case in demesnes, &c. the copses in the interior of the wood or plantation, if of any Although there are many extensive places extent, may be treated in the manner suggested where the woods, &c. do not come under the for profit, and those along the margins, by the gardener's superintendence, yet every gardener sides of the roads, walks, &c. managed as hinted

Knight's Marrow Pea .- By Suffolciensis.

The difficulty and expense in procuring sticks shamefully neglected by all parties concerned in for Knight's Gigantie or Tall Marrow Pea, have prevented many persons from growing that excellent vegetable. Having this year experienced we consider its stature and mode of growth, or some trouble in accomplishing this object, I turnits variety, color, and permanency of foliage. It ed my attention to some plan by which the use of is found in its natural state in various soils and long sticks might be superseded, and have just situations: but it appears to flourish most in a tried one, which appears, calculated to answer evloamy soil, inclining to peat, as may be seen in cry purpose. Although it will be attended with the vast tracts of natural wood in these countries, some little expense at first, I have no doubt it will The whip-makers, as I have found, give a decid-oventually prove cheaper to a regular grower

I have provided an upright stake or standard of oak, 3 in. by 11 in., about 71 ft. long. Holes are bored through this with a half-inch auger, about 3 inches distant. Having precured some good branching pea-sticks, from 3 feet to 5 feet long, I begin on one side at bottom, and place them in bottle or give it as a drench. If after two or the holes, in such a way as to make them touch and form a complete fan. I then fill the other juice of the leek or onion, given in a greater quanside in the same manner. NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 26, 1828.

GARDENER'S WORK FOR SEPTEMBER. Hoe and thin your growing crops of spinach. Earth up celery as it advances in growth, but be careful to avoid covering the hearts of the plants. This work should be done in a dry day. See that you do not bruise nor injure the stalks; for if they are crushed or wounded they will be subject to rot. Towards the latter end of the month you may transplant all kinds of hardy perennial, aromatic, and medicinal herbs, which will thus become rooted before winter. This work should if possible, be done in moist weather. Pull and preserve your ripe onions, and sow more to stand over winter. Protect grapes and other fruit against wasps. This may be done by hanging up phials of honied or sugared water near the fruit you wish to defend. Thoroughly clean from weeds all the seed beds and nurseries of trees.

HORSES.

Great numbers of horses have died within a few weeks, in the neighboring parts of Long Island, of the disease known by the name of "blind staggers." Opinions of practical farriers so far as we have heard, are various with regard to the cause. Many horses, as we have been informed, which had been sent from stables in the city, for the benefit of the air and pastures, have fallen victims to this disorder.

The Old Colony Memorial, published at Plymouth, Mass, mentions that the same disease is very prevalent in that vicinity, and gives the following remedy, from Mason's Farriery.

Bleed in the neck three times a week. Take an cunce of assafortida, one tea spoonful of salt petre, mix them and give them as a drink three times a week in the morning. Give an injection of meal, water, melasses and lard. Rub him well and exercise him moderately. A mash may be given him of bran, sulphur, salt petre, sassafras tea and assafortida; but give no drink for six hours. If all this answers no purpose after a few days, then take twenty-five grains of calomel, two drachus of opium, one drachm of powdered fennel seed, mixed with seme syrup into a ball, and give it in the morning for three or four days.

It is said that the following treatment, after repeated trials has proved effectual.

Take juice of garlie six spoonsful, and pour it down the horse's throat by means of a horn or three hours there is no relief, then repeat it. The

It is pretty well ascertained that horses confin-

^{*} in Ireland, hazel poles, from four to eight years' growth, are in great demand for hoops for butter fit kins.

Therefore "it would be advisable for every person, whose situation will admit of it, to confine their horses, particularly at night, during the spring and fall months." - N. Y. Daily Advertiser.

FOR THE NEW ENGLAND FARMER.

ELDER-BERRY SYRUP.

Mr. Fessenden-I was pleased to see an article in your paper of the 19th inst, calling the attention of your readers to a more frequent use of Elder-herry. It is a little singular that the Syrup of Elder-berry has not been used to a greater exthe same time so innocent a medicine, always at band, which might often save the call of a physician. I have been in the habit of making the syrup of elder-berries for the last seven or eight years, and have never found the least difficulty in keeping it. Accompanying this, you have a sample of some made about three years since; which dress by Wm. Hastings, Esq. of Mendon. looks as well as when first made.

Take of the juice of elder-berry one quart; boil to one pint; strain, and add two pounds double refined sugar; again place it over the fire; so soon as it shall have beiled, remove it from the fire; and when cold, bottle it for use, taking care to have it well corked. Should they neglect to put in the above quantity of sugar, there will be danger of its becoming mouldy. As a gentle purga- the 15th of October. tive, this syrup is an excellent medicine, of very pleasant taste; and is particularly serviceable for children who are difficult about taking medicine. The dose for an adult is a wine glass full.

FRUIT LADDER.

A gentleman, who is friendly to the objects of our paper, has been so obliging as to communi- Farmer office. cate to us, verbally, the following description of a ladder for gathering fruit, pruning trees, &c. which he says is much used in some parts of

It consists of two upright posts, from 7 to 10 feet long, (more or less, at the option of the constructor,) inclining towards each other, about 4 feet apart at the bottom, and I foot at the top .-The rounds of the ladder pass through these posts, and are about a foot apart. They are made somewhat larger in the middle than at the places where they are inserted into the posts, to give the greater strength to the machine. A third post is the ladder passes, permitting the post last mentioned to turn thereon, so that its lower end may be set at a greater or less distance from the other two posts, or rather from a straight line drawe between them. This ladder may be made light and portable, and possesses the advantage of supporting itself without leaning on any other object.

HARVEST IN ENGLAND.

Many English papers are complaining of the weather, the prospects or actual state of the harve t. But the London World, of Aug. 20th says, "all accounts concur in asserting that the corn has suffered, comparatively with the anticipation, very little; and generally, there is an average produce. The great loss has been in the hay; which in many places, especially in low lands, has been tion, specimens of all their grapes; particularly This restriction is called for, not less by a retinued moisture. In Ireland the weather has up-

ed in stables, seldom, if ever, have the staggers. on the whole, been good; and crops there are re-i der that they may taste and decide for themselves ported to be abundant, more especially potatos, the character of its fruit .- En, N. WINSHIP'S NURSERY.

We commend to our readers in the country, and to those in town, if they have a patch of earth on which to raise a tree or a shrub, the Nursery of the Messrs. Winships in Brighton, a catalogue of which has recently been published. It contains about four hundred different fruit trees, ornamental and flowering shrubs, herbaceous plants, and bulbous roots. The proprietors state that, in addition to the plants and shrubs enumerated in this catalogue, they have a further collection of one hundred and forty of the most splendid and added to these, through which the top round of choice kinds, recently selected from the N. York and Philadelphia nurseries, calculated to please the taste and fancy of connoisseurs, few if any of which have been cultivated in this vicinity. iters, at all times, have free access to the gardens, which are situated about four miles from Boston, on the Mill Dam road to Watertown-a pleasant half hour's ride from the city .- Boston Courier.

We are happy to see the attention of the public called to the Messrs Winships' Nursery. The fine taste of the Proprietors, their assiduous exertions in collecting every indigenous plant for ornament, and establishing an extensive nursery of valuable fruit trees, are worthy the patronage of the public.

The Messrs Winships have promised to send to the Farmer office, next week, for public inspec- apprentices, or clerks, with intemperate men.the Isabella, as there is some difference of opinion gard to the interest of the boy, than the reforamong horticulturists respecting its merits, in or- mation of the intemperate."

An acceptable present .- We had the pleasure of

The Castine American states, that Samuel Upton, Esq. of that town, has a bull calf, seven months old, measuring from the horns to the tail Ad- six feet, and five feet girth. His weight is supposed to be more than six hundred. Mr. Otis Little, Jr. in the same town, has a cluster of cucumbers, five in number, united at the stem end. and of good size. [Mr. Little procured his seed at the New England Farmer office. It is called the Green Cluster Cucumber, an early and productive sort.

INTEMPERANCE.

The subject of intemperance has engaged the attention of the Agricultural Society of Hamilton county, Ohio; and at their request, Dr. Dauiel Drake, an eminent physician and writer, recently delivered a discourse on the desolating effects of intemperate drinking, and on the means of staying this spreading pestilence .-He recommends, among other things, that the usc of ardent spirits in families be discontinued, that the absurd custom of offering them to visiters be renounced, that farmers and others should agree not to distribute liquor among those they employ, that the practice of drinking ardent spirits at all public meetings should be denounced and abolished, and that drinking establishments be suppressed.

Dr. Drake says, a too favorable opinion of tea and coffee, as substitutes for ardent spirits, could hardly be expressed. He admits that these infusions sometimes occasion injuries in females and sedentary young men, "but drunkenness is not of the number." He adds: "That their daily use, particularly the use of tea, contributes to the prevention of intemperance, there cannot be a doubt, I have not often seen a tea drinker become a drunkard; and quite as seldom known a man remain temperate who preferred an evening draught of spirit and water to that delightful beverage.-Of every known stimulus, tea seems, indeed, to raise in our faculties and feelings the pleasantest animation." Other substitutes mentioned by Dr. D. are cider, table and family beer, lemonade, &c.

"Of cordials," says Dr. D. "I cannot speak in terms of commendation. They abound in alcohol, rather mixed than chemically combined with other ingredients; and while the latter entice us into excessive drinking, the former produces almost every mischief that can flow from ardent spirits."

"Boys should not be placed as students,

kind should refuse to employ as operatives or journeymen, all who are given to drunkenness."

Hampshire Gazette.

Economical bread .- Only the course, flake bran to be removed from the flour; of this take five nounds, and boil it in rather more than four gallons of water; so that when perfectly smooth you may have three gallons and three quarts of branwater clear. With this knead fifty-six pounds of flour, adding salt and yeast in the same way, and in the same proportion as for other bread. When ready to bake, divide it into loaves and bake them two hours and a half.

Slap-jacks .- Mix one pint of Indian meal and four spoonfuls of flour into one quart of new milk; add four eggs and a little salt. Bake on a griddle as buck-wheat cakes, and serve hot, with fresh

Influence of the Moon on Plants .- There is an impression very general among gardeners, that the light of the moon has an injurious effect on plants, especially in the months of April and May. M. Arago has shown this notion to be erroneous, but accounts for its general prevalence in a very natural way. (" Annuaire du Bureau des Long." 1827.) He has demonstrated that, though there can be no reason to suppose that the light of the moon has any direct influence on vegetation, it must follow from the well established principles which govern the circulation of heat, that during clear moonlight nights plants are more liable to be nipped by cold, and turned brown, (whence the name of lune rousse, given by the French to the moon which, beginning in April, becomes full either at the end of that month or in May,) than when the nights are dark and cloudy. He refers to the investigations of our own countryman, Dr. Wells, on Dew, for the proof of the fact, that exposed bodies may frequently have their temperatures reduced six, seven, and even ten degrees below that of the surrounding atmosphere by the effect of radiation alone; but that when the heavens are obscured, radiation to such an extent does not take place. He then observes, that, as the temperature in the months of April and May is often not more than four, five or six degrees above the freezing point, it must follow that, when the moon shines bright, and radiation to its utmost possible extent takes place, the temperature of plants may, by this means, he often brought four, five or six degrees below the freezing point, whilst the circumambient air is above it. Of course, there need be no wonder, that even in the genial month of May, plants should sometimes exhibit all the withering influonce of lev December.

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be pub-In press at the New England Farmer office, and will be published to-morrow, the New England Farmer's Almanach for 1829. By Thomas G. Fessenden, Editor of the New England Farmer.—For sale, wholesale and retail, at the N. E. Farmer office, No. 32 North Market street, by Bowles & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office.

our first number has been honored, have induced the Editor and Proprietor of the New ENGLAND FARMER'S ALMANACE to renovated exertions to render the present in some degree worthy of the approbation, which has crowned our diary of 1923.

"Capitalists, and master workmen of every Our object has been to collect from every accessible source such information as we hope will be found to be of the greatest. For importing Grope Vine Roots from France, at a moderate otility to the greatest number of those whose use an agricultural Alipanack is more particularly calculated. But, although this title Tablet of Time is specially intended for the benefit of those who are actually and actively engaged in the pursuits of Husbandry, yet it may, perhaps, prove in some degree interesting to other classes in the community. Agriculture is that all in all, without which every thing valuable would suon cease to be. Though all mankind are not cultivators, yet all civilized human beings are consumers of the products of coltivation, and low who expended on the first deposit, 1822.

Investment of the products of coltivation, and low who expended on the first deposit, 1822.

Mr. A. L. will engage to formula subscribers with the Grape which the kind deposition is devoted. which this little doodceimo is devoted.

The New England Farmer's Almanack for 1829, it is thought will be found to be considerably improved on that of the preceding year; and is enlarged by the addition of eight pages. It contains, besides the usual astronomical articles of an Alma nack, a complete Calendar of the Courts for each State in New England, including the Probate Courts for Massachusetts, son's declination, a table of Roads and distances from Boston, and eighteen pages of Agricultural and Miscellaneous Articles, on the following subjects: On the Importance of a Good Garden -Hints to Mechanics-a Plough-cleaner, with a drawingon the Culture of the Yellow Locust Tree-on Wooking Bullson Working Cows-on Purifying Cellars, Apartments, &c.-on Extirpating Cock-roaches-on Preserving Smoked Meat-to Protect Young Plants from Worms-Cheap Maclone for raising Water, with a drawing-on the Construction of Gates, by Col. Pickering, with a drawing-on Elder-on Mears' spring Fastcoing for Horses, with a drawing-Machine for Conting Grain, with a drawing-an elaborate article on the Canker Worm--Hints on Fattening Swine--Directions for Gathering and Preserving Herbs, both for medical and culturary purposes on Lucerne-on Millet-on the Culture of Sweet Potatos in New Eugland-on Orchard-grass, &c. &c.

Country traders and others supplied on the most libera-

Splendid Bulbous Roots.

Just received at the New England Farmer Seed Store, No 52 North Market Street, direct from Van tieden & Co. Harlem Holland, a large assortment of Bulbous Flower Roots, compris

ing the finest variences of HYACINTHS-(double and single,) dark blue, percelair blue, red and rosy coloured, pure white, white with yellow eye white with rosy eye, and yellow with various eyes; from 25 ets

te \$1.00 cach.
TULIPS--splendid variega ed, red, yellow, and mixed, 1

cts, each \$1.00 per dozen.
CROWN LaireRIALS—asserted, of the most splendid col ours, and showy flowers, large roots, 38 cts. each.

uls, and show nevers, large roots, so ets. cach.
IONQUILLES—sweet scented, finest roots, 19 ets. cach,
POLYANTHUS NARCISSUS—traggant, winte with yellow cups, and yellow with double white cups, extra sized roots

38 cts, each.

D MIME NARCISSUS -fragrant, of all colors, 19 cts each SPRING CROCUS-of all colours, 6 cts. each. 50 cts. p.

The above roots are from the same house, from weich we re ceived our supply last scason, and which gave such unreersa satisfaction; some of the double Hyacinths having produced bells I inch and 8 ICths in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size and for the beauty and delicacy of that of their dowers. Those sold at auction are generally the mere refuse of the most inferior collections, good roots being worth at home ten times as much as they generally sell for at acciton, as will be seen by reference to the priced catalogues of any respectable house in Holland.

A further supply of Libes, Persian Fritellaries, Iris, Ixias

Pæonies, Amaryilis, Star of Bethlehem, &c. is daily expected All orders faithfully executed.

Spring Wheat.

Just received a few bushels of prime Gilman Spring Wheat growth of 1928, raised in Southborough, Ms.

Seeds for the West Indies.

Merchants, masters of vessels and others trading to the Wes Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box. Each box contains upwards of sixty different kinds of seeds, vegetable and orna mental, in quantities sufficient for a common kitchen garden.-The flattering reception, and extensive circulation with which growth of 1027.

The first number has been becaused the control of the growth of 1027. Likewise the greatest variety of seeds to be found in New Eng

Bleuching Satts.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, a further supply of Blouching Salts, or chloride of Lime, an account of which may be seen by referring to page 401 of the sixth vol. of the New England Furmer.

SUBSCRIPTION.

orice, and encouraging the introduction of that culture into the United States.

Mr Alphonse Loubat, having considerably cularged his Vinc-Mr Alphonse Loubat, having considerably calarged his Vine-yard, on Long Island, where he now has, in till cultivation, thirty five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to prowure the best specimens of not from his father's extensive vineyards and nurseries, in the districts of Lordelais, Clerac, and Buzet, departments of Gironde and Lot and Garonne, in France, (45° N. Lut.) proposes to the nuncrous friends to the cultivation of the grape vine in the Linted States, a subscrip-

ying roots, before one art of a starten next, and borward them free of expense, to the different either where subscription lists shall have been opened. The roots will be three years old, and will produce considerable from the second year from the time of their being planted. They will be care offy classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly lacilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to; the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 t-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50— Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 1 ; and 18 cents for less than 50 roots.—Payment to be made on delivery of the roots.—Letters not received onless post paid.

Subscription lists are open at New York, with Alphonse Lou-

But, 85 Wall street. Boston, E. Copelnod, Ir.—Albany, R. M'Michael—Philadelphia, Van Amringe-Bultimore, Willard Rhoads—Washington Cuy, Wm. Pairo.—Kichmond, Dayenport, Allen & Co.--Savanath, Hall. Shapter & Topper-New Orleans, Foster & Button-Charleston, (S. C.) J. & J. Street Mr A. Loubat's book on the Culture of the Grape Vine and on the Making of Wine: may be found at the principal book, schers of the United States; and his agents will turnish them gratis to subseribers.

The server annual tender would need the PRICES OF COUNTRY PRODUCE.

MISCELLANIES.

ODE TO THE HARVEST MOON.

(BY H. KIRKE WHITE.) Moon of harvest herald mild Of plenty, rustic labour's child, Hail! oh hail! I greet thy beam As sofi it trembles o'er the stream, And gilds the straw-thatch'd hamlet wild, Where innocence and peace reside;
'Tis thou that glad'st with joy the rustic throng.
Promptest the tripping dance, th' exhilirating song. Moon of harvest, I do love O'er the uplands now to rove, While thy modest ray serene Gilds the wide surrounding scene;

And to watch thee riding high In the blue vault of the sky, Where no thin vapour intercepts thy ray, But in unclouded majesty thou walkest on thy way.

> Pleasing 'tis, oh, modest moon! Now the night is at her noon,
> 'Neath thy sway to musung he,
> While around the zephyrs sigh.
> Fanning soft the sun-taun'd wheat, Ripen'd by the summer's heat; Picturing all the rustic's joy
> When boundless plenty greets his eye. And thinking soo Ob, modest moon How many a female eye will roam

Along the road, To see the load, The last dear load of harvest home.

Storms and tempests, floods and rains, Stern despuilers of the plains, Hence away, the season flee, Foes to light-heart joliny; May no winds careering high.
Drive the clouds along the sky;
But may all nature smile with aspect boon, When in the heavens thou show'st thy face, oh, Harvest Moon!
'Neath you lowly roof he lies,

The husbandman, with sleep-seal'd eyes; He dreams of crowded barns, and round The yard he hears the flail resound; Oh! may no hurricane destroy

His visionary views of joy; God of the winds! oh hear his humble pray'r, And while the moon of harvest shines, thy blust'ring whirlwind

Sons of luxury, to you Leave I sleep's dull pow'r to woo; Press ye still the downy bed, While tev'rish dreams surround your head; I will seek the woodland glade, Penetrate the thickest shade, Wrapt in contemplation's dreams, Wrapt in contemplation's dreams,
Musing high on hol, themes,
While on the gale
Shall sofity sail
The nightingale's enchanting tune,
And off my eyes
Shall grateful rise
To then the nuclear Harwest Moon To thee, the modest Harvest Moon!

From Bishop Heber's India.

CINNAMON-FIELDS OF CEYLON.

Our morning was, as usual on a first arrival, namon gardens, which cover upwards of 17,000 torrents were never before witnessed by them. acres of land on the coast, the largest of which gradually to green. It is now out of blossom, but and many lives lost. I am told that the flower is white, and appears

at first led us into the belief that we smelt the broken sheet of water. The produce of thousands cinnamon, but we were soon undeceived. On of acres is literally rotting in the ground. The pulling off a leaf or a twig you perceive the spicy Glasgow Chronicle notices the dreadful effects of odor very strongly, but I was surprised to hear that the flower has little or none. As cinnamon all suffered from a similar cause. forms the only considerable export of Ceylon, it is of course preserved with great care; by the old says, "We continue to receive, from all parts of Dutch law, the penalty for cutting a branch was the kingdom, accounts of the disastrous conseno less than the loss of a band; at present a fine quences of the late heavy rams, and serious apexpiates the same offence. The neighborhood of prehensions are generally felt for the coming har-Colombo is particularly favorable to its growth, vest," being well sheltered, with a bigh equable temperature; and as showers fall very frequently, tho' a whole day's heavy rain is uncommon, the ground made large and easy, as their feet are rapidly is never parched.

COMBUSTION OF THE HUMAN BODY.

AGRICULTURE.

(Prepared by the Editor.)

ILLS OF IGNORANCE IN ENTONOLOGY.

We are told that in Germany, the gardeners and country people, with great industry gather whole baskets full of the caterpillar of the destructive cabbage moth (Noctua Brussica, Fab.) and then bury them, which as Roesel well observes, is just as if we should endeavor to kill a crab by covering it with water; for, many of them being full grown and ready to pass into their next state, which they do under ground, instead of destroying them by this manœuvre, their appearance again the following year in greater numbers is actually facilitated. Yet this plan applied to our common cabbage caterpillar, which does not go under ground would succeed. So that some knowledge of the manners of an insect is often requisite to enable us to check its ravages effectually. With respect to noxious caterpillars in general, agriculturists and gardeners are not usually aware that the best mode of preventing their attacks is to destroy the female fly before she has laid her eggs, to do which the moth preceeding from each must be first ascertained. But if their research were carried still further, so as to enable them to distinguish the pupa and discover its haunts, and it would not be at all difficult to detect that of the greatest pest of our gardens, the cabbage butterfly, the work might be still more effectually accomplished.

Some larvæ are polyphagous, or feed upon a variety of plants; among others that of the yellow-tail moth (Bombyx chrysorhaa, F.); yet gardeners think they have done enough if they destroy the web-like nests which so often deform our fruit trees, without suspecting that new armies of assailants will wander from those on other plants which they have suffered to remain. Thus will thousands be produced in the following season, which had they known how to distinguish them, might have been extirpated. Another instance occurred to a friend when walking with a gentleman in his estate at a village in Yorkshire. His attention was attracted by several circular patches of dead grass, each having a stick with rags suspended to it placed in the centre. He at once discerned that the larva of the eock-chafer had eaten the roots of the grass, which being pulled up by the rooks [crows] that devour this mischievous grub, these birds had been mistaken by the tenant for the cause of the evil, and the rags were placed to frighten away his best friends .-Nor could be convince him by all that was said, that the rooks were not the cause of the evil .-Even philosophers sometimes fall into gross mistakes from this species of ignerance. Dr Darwin has observed, that destroying the beautiful but injurious woodpeckers is the only alternative for preventing the injury they do to our forest trees by boring into them; not being aware that they bore only those trees which insects had previously attacked, and that they diminish very considerably the number of such as are prejudicial to our forests.

entomological knowledge is necessary, both to prevent fatal mistakes, and to enable us to check with effect the ravages of insects. But ignorance to McGaw's patent. The invention is said to in this respect is not only unfit to remedy the evil; on the contrary it may often be regarded as its cause. A large proportion of the most noxious insects in every country are not indigenous, but have been imported. It was thus that the moth (Tinea Mellonella) so destructive in bee-hives, and the asparagus beetle (Lema Asparagi, I.) were made denizens of Sweden. The insert that has destroyed all the peach trees in St Helena was imported from the Cape; and in England (not to mention bugs and cockroaches) the great pest of our orehards, the apple Aphis, there is good reason to believe, was introduced with some foreign apple trees. Now, extensive as is our commerce. it is next to impossible, by any precautions, to prevent the importation of these noxious agents. A cargo, or even a sample, of peas from North America, might present us with that ravager of onlse, the pea-heetle (Bruchus Pisis L); or the famed Hessian fly, which some years ago eaused such trepidation in our cabinet, might have been conveyed here in a ship load of wheat. Leeuwenhoek's wolf (Tinea granella, F.) might visit us in a similar conveyance, from Holland or France, But though introduced, were entomology a more general pursuit, their presence would soon be detected, and the cvil at once nipt in the bud; whereas in a country where this science was not at all or little cultivated, they would most probably have increased to such an extent before they attracted notice, that every effort to extirpate ken a rapid rise. The former was selling last them would have proved ineffectual.

DAIRIES.

Nothing but milk and cream should be kept in dairies; nor anything that has a strong seent, although it may be sweet, should ever be placed in or near the milk room; but bad seents, particularly, greatly lessen the product of butter dairies. by preventing a complete separation of the cream from the milk .- Waistell's Designs for Agriculturol Buildings.

LOFTS OVER STABLES,

Are bad places for both hay and corn; as these articles in that situation, must be more or less impregnated with the noxious effluvia arising from the stale and dung, as well as from the breath of horses, thereby diminishing the nutritive qualities of the food, and occasioning disgust to the animals that eat it .- Ibid.

A Maine paper, the Wiseasset Intelligencer, says that the crops of hay in that state the present season, have been abundant-the crop of grain tolerably good-of Indian corn there is a good supply, well ripened, and already mostly harvested-potatos not so abundant-the crop of grain tolerably good-of Indian eorn there is a good supply well ripened, and already mostly harvested-potatos not so abundant as in some former stance is probably formed by some portion of the seasons, but a pretty fair crop.

Hams after being smoked, may be preserved From these facts it is sufficiently evident that through the year by packing them in oats.

We have seen some further specimens of paper made from straw and from blue grass, according prove entirely successful. A manufactory has been established at Chambersburg, in this state. and machinery, &c. is preparing for the manufacture of 300 reams a day. The paper is firm and strong, carries ink well, and is very suitable for wrapping, and it is believed, for banging also, and for all other purposes where strong paper is required, and can be furnished at a price so much below that made from any other material as to supercede every other of the kind .- Penn. Gaz.

A new species of the Bejuco de Guaço, so celchrated in South America for its power of curing wounds made by the most peisonous serpents, is now in full flower in the stove of A. B. Lambert, Esq. of Bayton House, Wilts, (one of the Vice Presidents of the Linnwan Society,) running from one end of the stove to the other, and filling the house with the perfume of its flowers. It was raised from seed sent from Carthagena last year to a gentleman in this town, by Mr Watts, the British Consul there. The Theophrasta America cana, a most curious plant, with the appearance of a palm, raised from seed, brought from St Demingo, by Dr liamilton, ten years ago, has flowered in the same gentleman's stove this summer for the first time. - English pa.

Agriculture .- The Montpelier (Vt.) Republican states that the or spects of the farmer are brighte ening in that quarter. Wheat and flour have taweek at \$1.40 per bushel, and the latter at \$7 per barrel, and very probably will rise. This improvement in the prices of agricultural products is very properly ascribed in part to a prospect of an increased demand in Europe, and partly to the influence of the tariff in creating a market at home. The farmer may often be at a loss, as to the most favorable moment for disposing of his surplus produce. It would perhaps, be the safest policy, as a general rule, to accept of fair prices, without indulging extravagant expectations. We can do no more than give, from time to time, all the information in our power, as to the state of the market, leaving our agricultural subscribers to judge for themselves .- N. Y. Statesman.

Fall of leares .- An article on this subject, translated from a paper by Prof. Vaucher, in the Memoirs of the Natural History Society at Geneva, is given in Brewster's Journal for October, 1826, which appears to us to account for the phenomena of the fall of the leaf in a more satisfactory manner than any preceding theory. According to Prof. Vaucher, every leaf consists of a distinct system of fibres, which have only a temporary continuity and unity with the shoot, kent up by a kind of adhesive substance, which, when the purpose of the leaf in the parent plant is severed, is dried up or dissolved. "The adhesive subparenchyma interposed between the two systems of fibres. While this parenchyma is under the influence of the vegetable action, the adhesion is maintained; when this action ceases, the union is

ness and truth of this theory, as far as respects dicotyledonous plants, becomes more obvious by leaves and the decay of tendrils. The leaves of plants, grasses, bulbs and other Monocotyledonete, in a strict sense, cannot be said ever to drop from the plants. Dr. Brewster judiciously observes, that M. Vaucher is the first who directed botanists to the organic structure at the base of the petiole; and he adds, that a similar arrangement probably prevails in the other parts of plants which successively drop off, and the connection of whose vessels with those of the stem, though necessarily intimate, is merely temporary. A new field is thus opened for botanical research .- Gard. Mag.

REPORTS OF THE WORCESTER AGRI-CULTURAL SOCIETY.

REPORT ON FAT CATTLE AND MILCH COWS.

The Committee on Fat Cattle and Milch Cows cannot express, in adequate terms, the gratification which they, in common with the multitude who have witnessed this day's Exhibition, received from that part of it which came under their peculiar cognizance. Eighteen fat oxen were entered for exhibition or premium, and sixteen were found in the pens. Among these they must first notice, those offered for exhibition only, by the Hon. Joseph Estabrook of Royalston, who has long been favorably known throughout this and other counties as a distinguished farmer. He presented twelve fine oxen from his pastures which by estimation would average from twelve to fifteen hundred weight each when slaughtered, and from their excellent points, their fatness and their number, attracted the attention of every one. Among such a Jury, as they may from their number well be styled, it would not have been easy to select a Foreman, and the Committee are happy that their duty did not require any such distinction to be made. Among the other oxen the Committee noticed one offered by Capt Ephraian Mower of Worcester, which was a fine animal having most if not all the good points required in such an animal. They also viewed with great pleasure the fine grass fed ox of John L. Boylston Esq. which weighed 2310 pounds, and they do not hesitate to pronounce him a superior animal, doing great credit to the gentleman who presented him. And it was when viewing such animals that the Committee regretted the limited number of premiums they had to award. These were ouly two-One of fifteen dollars which they award to Capt. Benjamin Harrington for his native grass fed Ox, eight years old, weighing 2511 pounds .-And the second premium of ten dollars they award to Gen. S. Towne, for his beautiful six years old ox, weighing 2237 pounds, half Holderness breed. The ox of Capt. Harrington, as he certifies, has had no grain or meal during the last summer, and the committee were induced to award the premium to him on account of his fatness, although the ox of Gen. Towne was much the most beautiful animal of the two; and considering his keeping which till the present season was common and ordinary, and entirely without grain, his great degree of fatness and excellent condition, were subjects of high commendation. The ox exhibited by the President of the Society, for exhibition only, was worthy of the high place he held in the estimation of the committee among the very fine mium of fifteen dollars should be awarded to Mr. his capital in any other way. No animal repays.

which he represented.

reflecting on the difference between the decay of Capt. Harrington, of Princeton, a remarkably fine strained milk per day, from the first to the twenhas been kept only upon hay and grass. She is October, eighteen quarts a day; although her half Holderness, six years old and added much to keeping was upon grass, in company with thirthe interest of the show of animals.

Old England may boast of her roast beef-and degeneracy in man or beast.

seventeen of which were in the pens. This was exhibited at the same time. as it should be. It was doing justice to the county which has long been distinguished for its dai- mittee award to Mr. Albert Stone, for his excelries. But more credit is due to one part than an-lent cow twelve years old which produced as cerother of the county, since ten of them were from tified about eighteen quarts of milk during the the town of Princeton, and eight of these were summer months, and thirteen quarts per day subexhibited by one gentleman, (John L. Boylston, sequent to September. Although the certificate Esq.) for whose public spirit and interest in its of her qualities in regard to mik was not so preconcerns, the Society owe their acknowledge- cise as the committee wished, yet when they took ments. Of the sixteen, eight were entered for ex- into consideration the calves fattened by her, her ibition only, and the time of the committee will appearance, and the facts which were certified, not permit them to do that justice which they they concluded to award for her the third precould wish to the animals or to the gentlemen who exhibited them. Stephen Salisbury, Esq. exhibited a fine cow, seven years old, half Denton own competitor, and if he will present so many breed; and Mr. Richard Mills, of Worcester, ex- animals, so fine that there is little or no difference bibited a native cow six years old, of a fine quali- he must not complain if he bimself should be calty. Mr. Asa Rice also exhibited a cow which led upon to decide, because "the doctors disawas acknowledged to be a fine animal, and Mr. gree." Upon examination and comparison, how-Boylston exhibited a beautiful Denton cow, and ever, the committee award to him the fourth preone other fine eow which the committee viewed miom, of six dollars, for a dark red four years old with pleasure. And among the animals for ex- cow, which averaged in her produce, nine pounds hibition, the remarkably fine cow of Col. J. W. of butter per week during the month of June, and Watson, Princeton, must hold a high place in the estimation and commendation of the committee.

Among the cows offered for exhibition only, the imported short horned Durham cow offered by describing this cow the committee describe also our enterprizing and public spirited fellow citizen the other four cows of Mr. Boylston, and they Stephen Williams, Esq. of Northborough, was par- here again express their regret that they were limticularly noted by the committee. Others may dispute about long horns, and short horns, the committee unanimously agreed that let long horns he as they might, the short horned cow of Mr. Williams deserved their unqualified approbation. tion they can only add that Colonel Lincoln's cow from recollection the several animals and their deserved her share of them, offered as she was for exhibition only.
